Under the car is placed a rock-shaft, operated by the lever, which works toggles or knee joints, forming a powerful pair of levers, which press down on each track a broad block of wood. The weight of the car can almost be lifted on these blocks, so powerful is the leverage. The device is very effectual, works quickly, and is not liable to breakage. It is operated by a hand lever The ordinary wheel brakes are controlled by a foot lever near the engineer, so when the grip is released he can slow down with the wheel brakes or stop suddenly with the track brake. In addition, the conductor can operate the wheel brakes on the rear part of the car. The engineer can throw down the track brake on the rear part of the car and lock the four wheels on the forward part at the same time.

The Grip.

The most important appliance on this class of roads is the gripping attachment, or grip, by which connection is made and unmade between the cable and the car. It is necessary to have a gripping apparatus simple in construction, with as much as possible of its mechanism above ground, so as to be accessible at all times, and to be carried at a uniform depth below the slot, so as to always maintain its position relative to the slot. In these cars the grip hangs on the fixed part of the truck, and not on the car itself. The truck is like that of a coach. The grip is between the center bolster and the forward axle of the truck, and there is but little motion to it, as the dummy man who operates it stands directly over the king-holt, around which the truck is free to swivel.

ROOT'S PATENT GRIP.

The grips of these cable roads are as much a mystery to most people as a steam engine. Men ride behind locomotives and on steamers every day who have no definite idea of the power that moves them. They ride on cable cars day after day and year after year, see a man use a lever to stop and start, but beyond knowing that something "grabs" the rope, they are in the dark. To describe in detail the operation and construction of a grip would puzzle nearly all. Yet the operation is quite simple, now the idea is worked out, though the problem had many difficulties which only experience and ingenuity have been able to overcome.

The grip in use on this road is one invented and patented by Mr. Henry Root, the engineer and superintendent of construction. It is formed of two frames, one sliding outside the other. The outer one is secured to the grip-bar of the dummy (or forward part of car) by bolts, and carries the lower jaw, while the inner frame, which slides up and down upon the outer one, carries the upper jaw, the quadrant, the operating lever and adjusting mechanism, and is held in place by guide plates extending across the stationary inside frame, and between which it slides.

The frame carrying the jaws passes through the slot directly down alongside the cable, without offset. The grip-bar on which these parts are mounted is secured and supported by a frame on the running gear or truck, and not on the car itself. The car body can therefore be mounted on springs without any of the spring motion being imparted to the grip and through it to the cable. In the way in which this grip is arranged, all the parts liable to get out of order are accessible, and it is not necessary to provide pits in which to examine them. The engraving given herewith shows the construction of the grip.

ROUTE OF MARKET STREET CABLE RAILROAD.

When the car is at a standstill, the wire cable passes along over the chilled-iron grooved rollers at each end of the lower die. The lever operating the grip is then inclined forward. When the engineer desires to start the car he moves the hand lever back. This action moves the inner frame downward, carrying with it the upper jaw or die. This die consists of a hollow piece of soft cast-iron secured in the lower end of the sliding part. The lower die is a shorter piece of soft cast-iron fitted lengthwise between the two rollers. This is arranged with set screws to be raised to take up wear. The upper die is longer than the lower, and as it is forced down by the inner frame it rests on the moving cable, and pushes or presses it tight on the rollers before pressing it on the lower die. Gradual motion is thus imparted to the car, without jerk or jar. A still further downward motion of the upper die forces the rope or cable on to the lower die, the cable being thus held tightly between the dies. A reverse motion of the lever raises the frame and upper die, and releases the cable and allows it to run through freely without imparting any pressure to the car. The brake can then stop the car. The head of the toggle operating the inner frame slides up and makes a difference in the length of the link, so that wear of the upper die is accounted for. Wood has been tried for the dies, and so has brass, but soft iron is found to be as good. The dies are easily changed. The frames of the grip are made of steel, from the Judson Iron and Steel Works in Oakland. Phosphor bronze was found to be too soft. Steel seems the best. They have been made of common cast-iron, but this is too brittle, as a blow may break it. The first thing to suggest itself would be wrought iron, but there are several objections to its use. It is more expensive than a casting; and its liability to bend is a serious objection. While the material must necessarily be tough and strong, it is better that it should break than bend under any severe strain, since it is preferable to lose a grip than to have to endanger the tube, cars or passengers. The law prescribes that the slot in the street through which the grip passes must be no more than three-fourths of an inch wide, so it will be seen there can be no spare metal, for there must be some play. This grip works very satisfactorily indeed. The grips were manufactured in this city by William H. Birch, of the California Machine Works, as were also the sheaves and tighteners.

Construction of Road-Bed.

In laying out the plans for this line the experience of other cable roads was carefully considered, with a view, if possible, of providing against difficulties formerly met with. Every detail was studied with the utmost attention. The constructors had themselves built one successfully operating cable road in the city, and were fully acquainted with the requirements. Cable railways are ordinarily constructed of iron ribs of the form of the tube, set at suitable intervals, to which the slot iron or timber, as the case may be, is bolted, and the spaces between these ribs filled with wood to form a continuous tube. Outside and independent of this tube the rails are laid, supported on

short ties or other foundations, and connected horizontally with the iron ribs by short bolts or rods, but are liable to settle by the undermining of their foundation without regard to the tube or the other rail of the track. This will frequently occur by the renewal of the paving outside of the track, the introduction of house-connections with the main sewers, or other disturbances of the track. This settling causes great inconvenience.

It was determined, in building this road, to form a single rigid structure, by connecting the rails and slot-irons by yokes, and uniting the whole by employing concrete.

The engravings show plainly how the road-bed has been made. The main tie or yoke connecting the opposite rails is formed of old railroad T rail, bent in suitable shape, head down. It embraces the tube, and has fastened to the ends suitable chairs or plates to which the rails are secured. From the lower part of the curved yoke extend upward two supports for the slot-irons. The lower ends of these are sufficiently separated to form the necessary width for the tube.

Tie-rods connect these supports with the main yokes through the chairs. The two rails, slot-irons and yoke are then all connected rigidly together as one. These yokes are placed every three feet along the length of the road. The rails and slot-irons being connected in the same structure, all the parts are maintained in their relative position. Whatever may occur to alter the place of one has no effect, unless the change is sufficient to effect the whole structure.

In building the road, the first thing done was to excavate places every nine feet, in which was constructed a concrete pier sixteen inches thick by five feet long crosswise the track, on which the main structure stands.

There are altogether some 9,000 of these piers, the foundation of which are 10 feet below the rails. For a number of blocks at the lower end of Market street the street is "made ground;" that is, it has been filled in on to the hay mud. In order to get a solid foundation, piles had to be driven to support these piers, so all tendency to settle was avoided.

The piers being built and the trench dug, a section of rail and slot-iron was put in place on the piers, and concrete filled in, filling the space between the rails and slot-iron, and forming a support for the iron-work.

The concrete was not filled in the center, but a core was temporarily used, so the tube or rope-way was thus formed between the slot-iron supports. As nearly all the weight of the traffic is on the rails, the tendency of the rails to go down is resisted by the deep girder of which the bent tie forms the top and this continuous mass of concrete the bottom. There is no danger of unequal settlement. We give an engraving which shows a section of the road-bed with these piers. The soil in which the road is built is sandy.

In building this road, over 40,000 barrels of Portland cement were used for the concrete. There were 25,000 ribs or yokes used, also. Of the steel channel-rail that forms the slot, about 1,000 tons were consumed.

The form of this slot-iron is peculiar. It is not an angle iron in the ordinary sense. The top part is 2¾ inches wide and the inside or lower portion is 5 inches deep and ⅝ of an inch thick below the fillet. It is bolted on to the upright of the ribs. The upright parts of the two slot-irons are wider apart at the bottom than on top. The edges of the iron are ¾ of an inch apart at the top and 5 inches at the bottom, although only 5 inches deep, the slope being divided between the two. They slope back almost two inches in five. This gives room below for the straps on the grip.

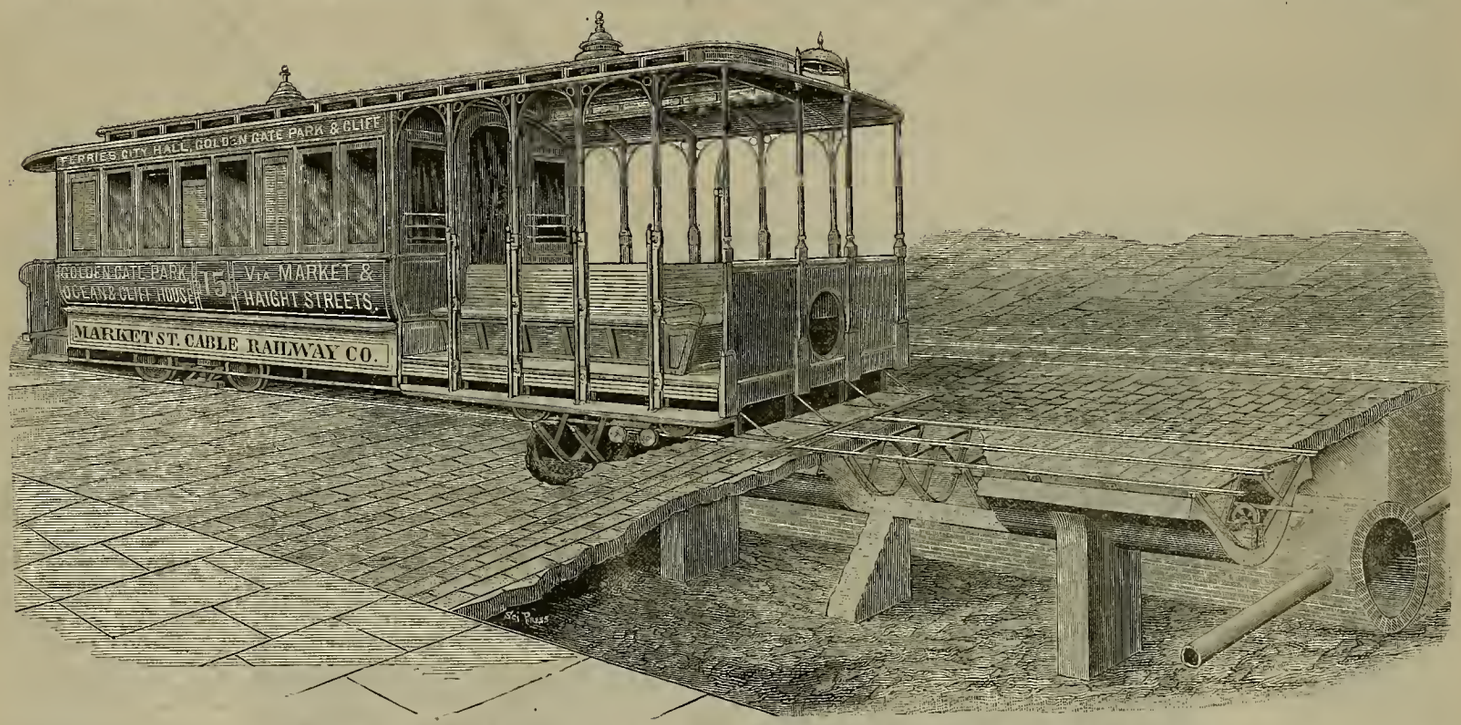
By building the whole road on piers a very firm foundation was obtained, and chance of any settling obviated. If the street was dug away this structure would remain on its 9,000 piers, like one of the old aqueducts. A double purpose was served by this. People wanting to make sewer connections or connect with water or gas pipes can do so without disturbing the road. They run all such connections between the piers, and even if careless workmen fail to make all solid again, the road does not suffer.

The Rail.

The rail used on this road is peculiar in shape, and is the same put in the California street railroad in 1877. The form was made specially for that road, drawings being furnished by the constructors to the Cambria Iron and Steel Co., of Johnstown, Penn., who made the first lot. Those on the road under consideration were made here by the Pacific Rolling Mills, from imported Bessemer-steel blooms. The rail weighs 38 pounds to the yard. It is a sort of combination T and street-car rail, the object being to get some thing that could be secured with a fish-plate joint. The rail is 3 inches wide, 2 inches of face, and 1 inch of inner flange. It is 3 inches high. The main peculiarity is in the inner part of the T being dropped down to form the flat flangeway for the car wheels.

Supporting Pulleys.

Every thirty feet along the road is a grooved supporting pulley. These form the carriers for the rope. The pulley for this purpose is a solid casting, axle and all. It is 15 inches in diameter over the flanges, and 13½ inches in diameter to the bed of the groove where the rope bears. The axles are 1¼ inch in diameter, and 12 inches long. The bearings are 2½ inches long. A flange, or rib, is cast on the axle to prevent end motion, and it runs in a corresponding groove in the box. The box in which each bearing sets is a lignum-vitæ block, set in a cast iron shell which carries the lubricant. That used after comparative test is the Standard Lubricating Compound, made by the New York Refining Co. The shells fit in a cast iron frame, which rests on a small brick foundation in the tube or rope tunnel. There are two side walls that the edge of the frame rests on, leaving a clear passage-way under the pulley of some three inches. Each of these supporting pulleys weighs about 40 pounds. They last a long time and are seldom broken.



The Pulley Plates.

It is necessary to have these pulleys readily accessible, so, over each one is a removable plate, which it took some ingenuity to devise, since the plate must be secure in its place, must form no obstruction to traffic, and stand heavy blows, and at the same time must be constructed so as to be taken up readily for oiling the pulley and cleaning the ropeway. The plate is twelve by sixteen inches and of flat three-eighth wrought iron. On the under side, running lengthwise the center, is a channel-iron truss for the truss straps, three of which cross it. One end of this channel-iron truss projects past the plate and nips into a recess in the cast iron frame. The other end comes flush with the plate, and a cast iron hook or dog drops or latches into the recess formed by the channel iron, and holds the plate in place. The latch or dog has a weight formed on it, and hangs in the cast iron frame out of the way under the pavement. It is automatic in its action, and can not be disengaged by accident. The top of the plate has numerous rivet heads to roughen it, and secure the truss and straps. The plate is subject to very heavy blows, so no rings or loose lifting arrangement can be used. Two holes are bored in the plate by which the hook is disengaged and it is lifted. The pulleys can then be oiled. The tube is also cleaned out through these openings. A man with a peculiarly shaped shovel or hoe, operated through the grip-slot, pushes the dust and dirt to the opening, where it is readily removed. These plates, complete, cost about $2 apiece.

The Depression Pulleys.

It must be remembered that in these cable roads, in addition to the supporting pulleys below, which prevent the rope sagging, there must be also pulleys provided at the crossings of upgrades, to hold the traveling cable down below the surface of the street and within the tube. These pulleys, being above, would necessarily be in the way of the grip on the car, which is also above, if provision were not made to let the grip pass. This is by no means a simple problem, and more or less trouble has been experienced with those in general use. The depression pulley mechanism on the Market-street road, the first of its kind used, has answered the purpose admirably. The depression pulleys are usually common pulleys, upon the under side of which the cable passes, and which are placed to one side and passed by a peculiar grip, or adapted to move in some manner that the grip may pass, and then return to position. The method used on the first roads constructed here was to place the cable some distance to one side of the slot in which the grip travels. The grip was then made L-shaped, so as to enable the shank to pass the depression pulleys as the cable was carried by the grip at a fixed distance below the surface of the track. As the grip approaches these pulleys the cable is pressed down clear of them, and the shank passes to one side of the pulley, the L forming an offset. This method is objectionable because the draft is to one side and causes a twisting strain on the shank. A grip with no offset, and passing down vertically without angle, can not pass depression pulleys arranged in the ordinary way. A different plan was therefore necessitated on this road.

At the proper position under the roadway is placed a horizontal arm, one end of which is pivoted or swiveled in a suitable manner near the slot-opening, and the other end of which carries a pulley. This is the depression pulley, and holds the cable down. A counterpoise or weight keeps the arm and pulley in its place with relation to the center of the slot and over the cable. As the car comes along, the grip of course holds the cable down so as to press it out of the groove in the pulley. This leaves the arm carrying the pulley free to swing aside but that it is held by the counterpoise. The shank of the grip, however, begins to press against the side of this arm, near its hinged end, and without jar or shock presses the arm and pulley aside. The instant the shank has passed, the counterpoise brings the arm and pulley back to its central position again. As the car goes on further, the rope gradually swings back up to its normal position and comes into the groove of the pulley again. The frame or arm carrying this pulley is set at a small angle to the plane in which the grip-shank travels, and if any part should become broken, the weight or counterpoise draws the pulley and frame out of the way out of the line of travel of the shank, so there is no danger of any obstacle in the line of travel of the grip. There is no spring to get out of order in this arrangement. It must be remembered, of course, that cars can go only one way on the respective tracks of these cable roads, the cables running up one track and down the other. The grip always comes one way, and as the arm is set at an angle with the slot and partly crosses it, the grip shank must come in contact with it just at the right time and push it aside. The arm is about six feet long. This is an ingenious arrangement, and is at the same time both simple and effective. We have now to consider the method of

SECTION OF ROAD-BED SHOWING FOUNDATION PIERS, TUBE, ROOT'S PATENT CAR, ETC.

Rounding the Curves.

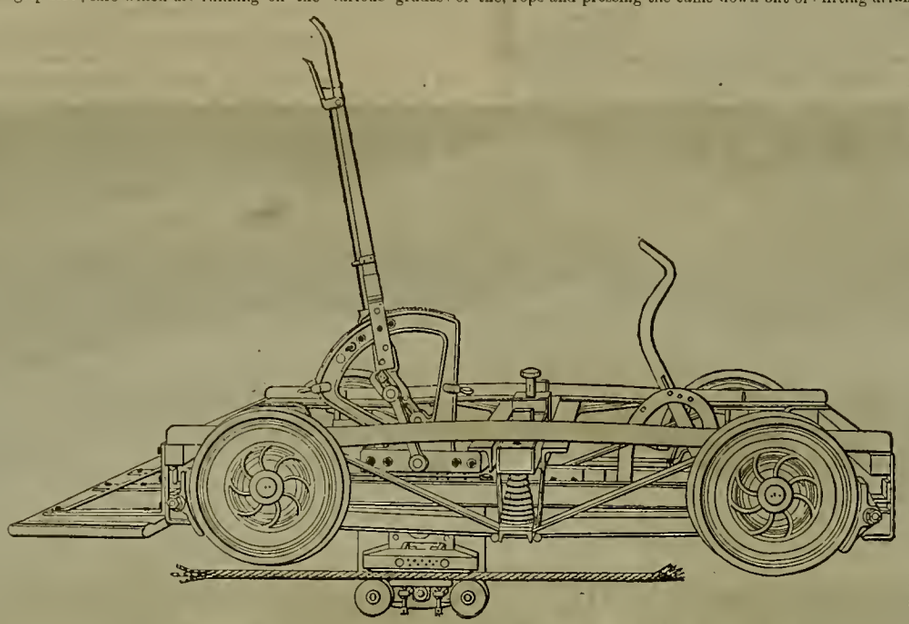
There are several mechanical difficulties to be met with on the curves of cable roads, especially where they have to pass around those of ninety degrees or more, with a radius now commonly used in cities with narrow streets nearly or quite at right angles with each other. The means used for rounding the curve on the Market street road are different from those applied anywhere else, and deserve some detailed description. The curve on this road where the new system is applied is at the junction of Market and Valencia streets, in front of the engine-house.

The main feature is in the use of an auxiliary cable in the curve on the line of the grip-slot running at half the speed of the main cable. The two streets named do not meet at right angles. The Market street cable passes around its guide sheaves into the engine-house, and that of Valencia street does the same. Between the end sheaves of these respective cables plies the auxiliary one which carries the cars from one to the other.

This auxiliary cable is driven from a six-foot, V-shaped iron wheel on the engine shaft. Guide pulleys suitably placed lead it out into its tube or rope-way, and back again.

In the curve it is guided by 15 side-bearing coned pulleys. The bases of the cones are downward, so that when the cable is within the jaws of the grip it is opposite the upper part of the conical face, and there is sufficient space for the grip to travel without touching the sheaves. When the cable is released from the grip it may settle to the lower or larger portion of the sheave-face. The auxiliary rope is 400 feet long, and the curve has 80 feet radius and about 55 degrees of angle.

The diagram showing the plan of engines and the guide-pulleys of the various cables shows also the position of the auxiliary cable and its side-bearing pulleys. By examining this it will be seen that the auxiliary cable only runs between one pair of tracks, and propels the cars only from Valencia street around the curve into Market street. It happens that at that point the grade is such that the cars coming from the ferry, when they let go the Market street cable, will run by gravitation around the curve to the point where they can take hold of the Valencia street cable.



The diagram shows the auxiliary rope driven by the cable but the plan is not used. It is driven from the engine shaft.

On the return, however, they are on the up-grade, and there the auxiliary cable comes into play. A slight bend or turn in the track out of its regular line swings the car and grip to one side, so that the cable passes out of the side of the grip from between the jaws. The momentum of the car carries it on a few feet to the point where the auxiliary cable is running, and this cable passes into the side of the grip, the jaws of which are open to receive it. By the proper movement of the lever by the dummy-man the grip-jaws close on the cable, and the car is drawn around the curve. As it reaches the end of the auxiliary rope, another curve or swing in the track swings the grip away from the rope, the jaws being opened for the purpose. The momentum of the car carries it a few feet, to the point where the grip may take hold of the main-line cable, and continues on its way. The cars have only a space of about eight feet to travel by momentum. The distance they travel on the auxiliary rope is about 120 feet.

At proper points on the roadway are iron plates with block letters, with the words "let go," "stop," etc., so the engineer will know exactly where to manipulate the grip and brakes. At night the big headlights show these plates plainly.

Experience proves that it is impracticable to move cars around short curves at the same rate of speed at which the cable should travel on straight lines, as the sudden change of direction would have an unpleasant effect upon passengers. This auxiliary cable travels four miles an hour just half the speed of the main-line cables.

The tension of this auxiliary cable is much less than that of the main cable, as it only has to move one car at a time around the curve, while the main cable has the strain of all the cars which are running on the various grades of the whole line. The tension being so much less, it is easy to relieve the grip from side strain and prevent undue friction and wear in passing curves.

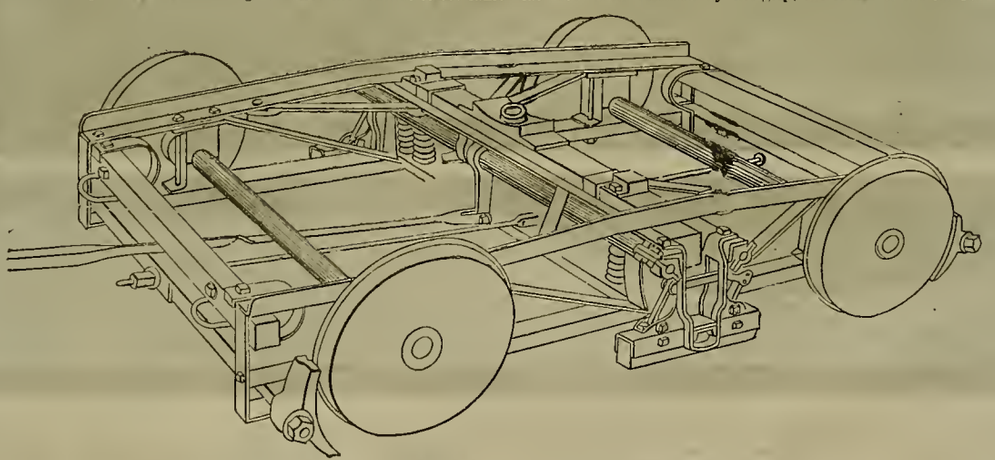
ROOT'S PATENT FORWARD TRUCK, WITH GRIP, BRAKE LEVER AND FENDER.

Switch and Safety Arrangement.

Just before the curve at Valencia street is reached, the cars which are to go out the Haight street branch switch off from the main line to the right. There the Market street cable has to be dropped while the car goes around its curve in switching on to the Haight street cable, which, as before explained, is a separate rope entirely. The switch is so arranged that not only the rail but the grip-slot is set for the car as it goes around the curve. It was found that sometimes the dummy-men were careless, and did not let go the cable in time, so that as the car started around the curve the cable kept carrying the grip straight ahead on the main line.

The consequence of this, as might be expected, was a broken grip, and sometimes a cut cable. It would not do, therefore, to trust entirely to the dummy-men at this point, and arrangements had to be made to provide some sort of safety apparatus, so in case the cable was not dropped no breakage could occur.

A switchman stands at the switch, to move the lever which throws over the guide-rail and slot-iron for turning the car off the main track. The same movement that does this also works the safety apparatus, some 30 feet away.



Connected with the switch-lever, by bell-cranks, is a long shaft. On the side of this is a pin carrying a roller 6 inches in diameter and 8 inches long. This shaft is at one side of the rope tunnel or tube. The roller stands in an upright position—to one side and out of the way of the main-line cable and grip—when the Haight street switch is closed. The main line is then clear for the passage of the grip, without releasing the rope. When the switch lever is moved, however, the shaft is revolved by the same motion, throwing the roller down on top of the rope and pressing the cable down out of its straight line. The top of the roller is then lower than the bottom of the grip, so the grip is free to pass over it provided it, has released the rope.

When the car comes along, if the grip has dropped the cable it passes on around the curve all right on to Haight street, on a slightly descending grade. In case, however, the cable has not been released by the grip, the cable draws the roller up and revolves the long shaft which swings the bell-crank on the switch end of it, closes the switch, and compels the car to keep the main line. Of course then no grip can be broken, because the car keeps on the same line as the cable. The car is then stopped, backed up, and moved around the curve, where it should have gone in the first place. The fact of it having gone on down the main line is of course proof that the dummy-man neglected his duty, and several repetitions would prove his inefficiency and cause loss of position. It makes the men careful, therefore, at this point. Still, the safety arrangement always stands ready automatically to correct any such faults, or at least to prevent breakage and detention.

As the cars return from Haight street to the main line they let go the Haight street cable, which passes off to the right around a guide pulley, crossing the street to the engine house. The car runs by gravity around the slight curve on to the main track. Here the main Market street cable must be picked up, and an ingenious arrangement has been devised for this also.

It will be remembered that the grip is a side-hold one; that is, the cable goes in at the side to be caught by the grip. Therefore, if the rope were raised up vertically at this point it would strike against the bottom of the grip and prevent its being raised.

The rope, of course, when dropped by the grip, falls into the supporting pulleys, which are below the level of the grip, so the cable must be raised until the grip can take it. The lifting arrangement consists of a cross of inch and a half gaspipe, one end of the head of which is hinged to each yoke of the road-bed frame. No guides are needed. The pipe projecting from the cross carries a conical roller six inches long, six inches in diameter at one end, and two and a half inches at the other. A chain from the end of this pipe comes up to the surface of the street. The conductor leaves the car and pulls on the chain. This raises the pipe and roller, and the conical roller striking against the rope not only raises it, but causes it to describe a sort of half circle, drawing it to one side, so that when all the way up it slides back, down the small end of the roller, into the side of the grip, between the jaws. It is then grasped by the grip, and the car goes on down the line. This arrangement answers the purpose perfectly, and is very convenient. The cost of construction was trifling.

ROOT'S PATENT REAR TRUCK SHOWING TRACK-BRAKE.

The Turn-Table.

At the ferry-house, foot of Market street, the cars are turned around, so the open portion carrying the grip will be ahead. This turn-table is on the wharf, over the water, and the large pulley around which the cable turns is just beyond it. A slight raise in the track is made at this point, so as to give a down-grade on the way back, for a short distance. As the car comes down the street the cable is released from the grip, by a slight bend in the track taking the car out of its line. The momentum of the car carries it on to the turn-table, which is 30 feet in diameter. There are four sets of tracks, one for the incoming car and three for the outgoing. The Valencia street car is shifted to its side-track, the Haight street car to its track, and the McAllister goes on a track prepared for it. These three outgoing tracks merge into the main line a short distance from the turn-table; but by having the three side tracks, the cars for the respective routes may follow each other quickly. Being on a grade, the cars are readily pushed to these tracks, and run by gravity a few lengths, to where they grasp the cable running up Market street. The grip does not have to be raised while the cars are on the table or side tracks.

There are two tracks on this table, so it can be turned and transferred by them at the same time. By having the double tracks, when one car comes on and is turned around, headed for its side-track, the other pair of tracks of the turn-table is in position with relation to the main track, so the incoming car can come right on. The table has, therefore, never to be turned back. Between both tracks there is a slot and tube-way for the grip, forming a continuation of the incoming and outgoing tracks, into which the grip passes, and passes out of the opposite end after the table is turned, the cable itself being dropped down and passing to one side of the foundation of the table.

The turn-table is revolved by the power of

the cable itself. Under the street is a four-foot wheel, in the center of which is a ten-inch wheel impinging on the lower edge of the turn-table. This is a paper friction wheel. On the street above a man operates a lever, which presses the moving cable on to the rim of the four-foot wheel, thus revolving it and the ten-inch wheel, and giving one-fifth the speed of the cable to the turn-table. The table can be thus turned round slowly, and stopped as desired. Dogs drop into place and hold the table opposite the track on which the car is to run.

The Depot and Car-Houses.

At the end of the Valencia street line is the fine large carhouse or depot, where the cars are kept at night. The structure is a very large one, 420 feet long by 100 feet wide, and two stories high. Great rows of "windows" and "sky-lights" make the building light and airy, and the company own ground around it so the light can not be obstructed. There are elevators for lifting the cars to the upper story, arrangements for shifting the cars on the numberless tracks, and all the necessary features for a depot. At the end of the line is a turn-table, and from it the cars run by gravity into the depot. They run out to the track again from the lower end of the depot.

The cars on the Haight street branch are housed in a depot for their special accommodation, on Haight street, midway between Shrader and Stanyan streets, about two hundred and fifty feet before the terminus is reached. The depot is a two-story structure—one floor only, however, having been built. Provision has been made for the second floor when required. There is a grade of three and a half feet in one hundred on the road at this point, so that the cars run by gravity from the main track into the house; and go out by gravitation, also, from the other door to the main track again.

The road was opened on the 22d of August last. The officers of this company are:

Leland Stanford, President;

Chas. F. Crocker, Vice-President;

J. L. Wilcutt, Secretary;

Henry Root, Engineer and Superintendent of Construction.

C. B. Gould, Superintendent of Operating.

The general design of the whole road was made by Mr. Root, who also designed and constructed the California street hill cable road. Many of the appliances and devices in use on the road were invented by Mr. Root; notably the cars, grip, tension apparatus, road-bed, depression pulley, etc. All the details were arranged under his immediate supervision, and the road is operated under license from him. The road is a first-class engineering job, and superior in its details to any heretofore built.

Considerable stress has been laid on the fact of the great weight of the cable on the Brooklyn bridge, when speaking of the difficulties to be overcome by the road. Their rope is something less than 12,000 feet long. It weighs not to exceed three-quarters the weight of the ferry cable of the Market street road, and that is only a little over one-third of the cables driven by the one engine. There is apparently no excuse in the case of the Brooklyn bridge line for hot bearings on the plea of heavy traffic, for there are probably not more than four cars at a time running; while the Market street line has forty-six cars on the road all the time, carrying heavy loads.

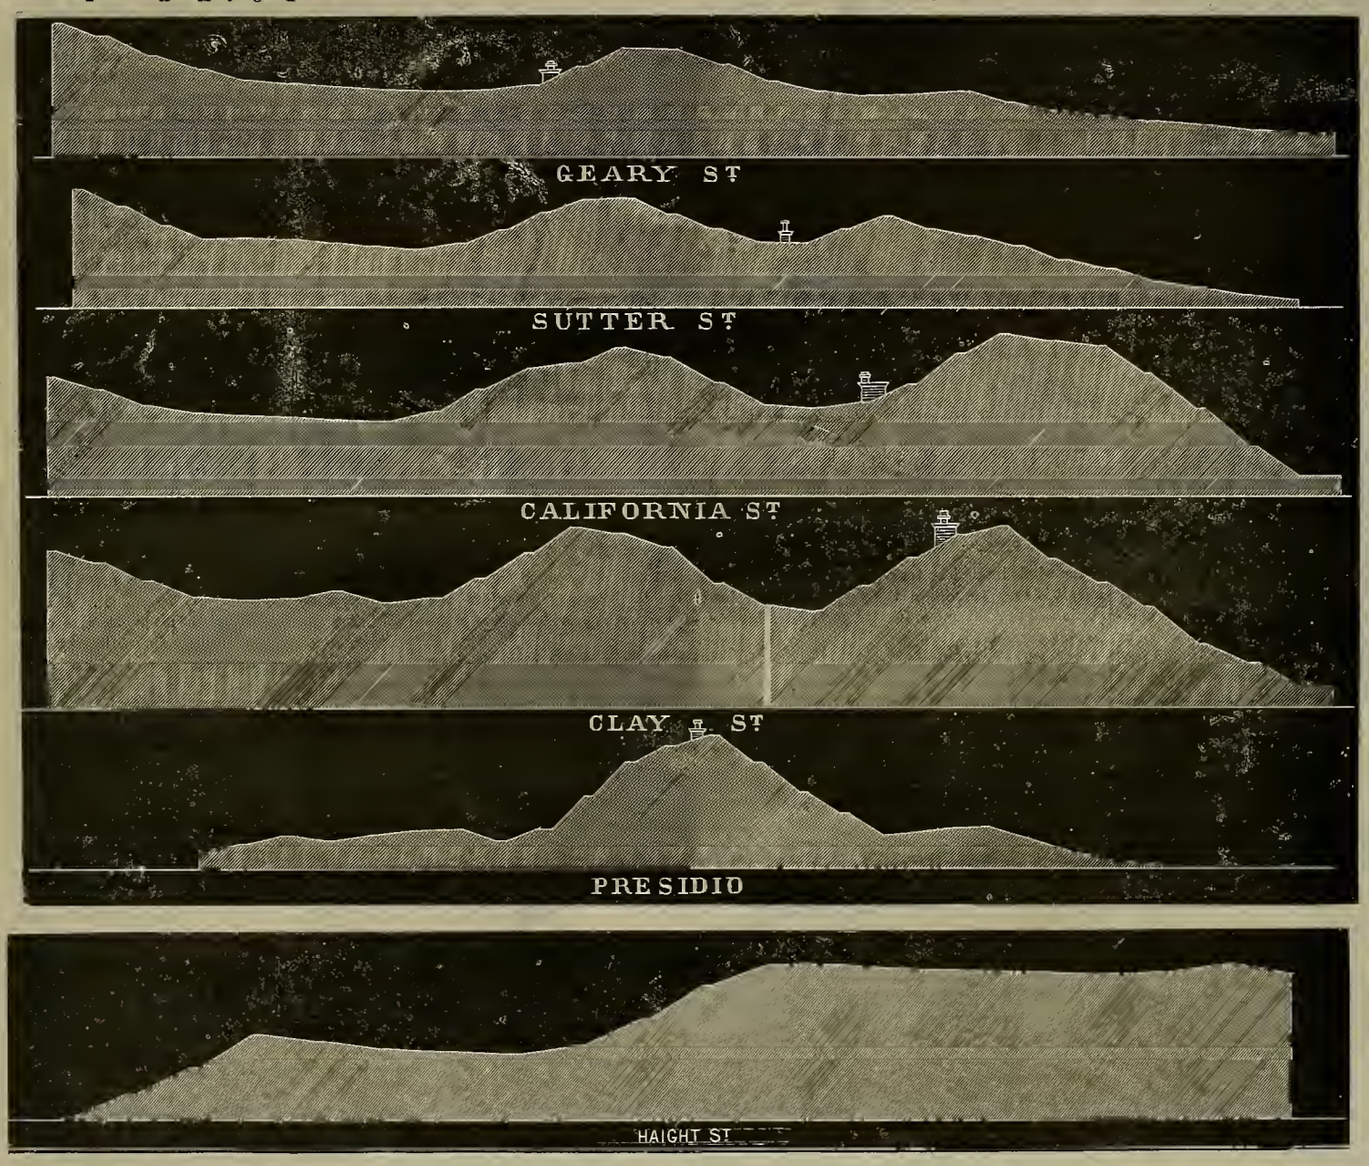
A NUMBER of the Bingham mines, on which work has been resumed lately, are now producing, and the prospects are favorable for their continuing to do so all winter.

SALT LAKE CITY is to have a Mining Institute, and Professor Clayton is superintending the arrangement of the rooms for the reception of minerals and furniture.

Cables and Electricity.

It is frequently suggested by the press that electricity ought to be substituted for the cable as a motive power for street cars. It is not generally understood that the electric roads are yet in the experimental stage; and, moreover, there is a misapprehension of the whole subject which should be removed. The fact is, no one has attempted to use electricity as a motive power, and no purely electric road is running. In all the experiments in that direction the object has been to utilize the electricity as a *medium* to transmit the power from a steam engine to the cars. It is a mistake commonly made by people that ought to know better, this confounding the medium with the power.

We hear frequent statements that an electric road is able to use seventy per cent of the power generated by the engine, when the fact is there is not a single road at work utilizing fifty per cent; nor a road that is running continuously from one year's end to another. These roads get their power from the heat of the coal originally, and electricity, as used for propulsion, is only a different form of the medium for transmitting the power of the engine, from that of a cable.



All an electric car can do, as now arranged, is to turn the wheels on the track to propel itself. One of the claims of the superiority of the electric system is the lightness of the dummy or motor. On a road in this city is a steam dummy which weighs 14,000 pounds, all on the drivers, yet it will stall with one car on a rainy day when the track is wet. An electric motor would be worse, for the power depends on the weight in such cases. Weight is required for adhesion, and with half the weight, half the adhesion is obtained. The light weight of electric dummies is really against them, instead of being an advantage.

The answer to this might be that the passengers might be put on the dummy to give it weight. That was the first idea with steam dummies, but it was found to be impracticable. The general practice is a separate dummy.

Of course, electric cars would be of no use on hills such as our roads in this city traverse; and even on what we call our level roads, they would be impracticable. The cable roads run equally well on all grades, up or down, or on a level. The weather does not affect them. The only loss of power from the main engine is the friction of the rope on the loose pulleys over which it runs.

They have been experimenting in this city with an electric motor, and so far they have found it takes a 12-horse engine five hours to charge the batteries of a dummy which will run three hours. This will never do, of course, but the experiments are being continued to increase the efficiency. Even then no hills can be climbed.

Aside from the ability to carry more passengers, the increased speed, larger size of cars, power to go up and down steep hills at the same rate, and other advantages of cable roads, they are run much cheaper than horse car lines. It is not at all probable that electricity will excel the cable system, unless some very radical improvements are made.

PROFILES OF DIFFERENT SAN FRANCISCO CABLE RAILROADS.

COEFFICIENTS OF FRICTION.—Professor Thurston states that the coefficients of friction of lubricated surfaces under pressure, as given in text books, are much too high; instead of 4 to 7 per cent, as stated therein, he has obtained as low as one-fourth of 1 per cent, with sperm oil. This, he says, is the best he ever found for heavy pressures, and he has made experiments all the way from very light up to 1,500 pounds per inch of surface. The crank pins of beam engines on steamboats, where a thousand pounds pressure to the square inch is not uncommon, run as low as one-half of 1 per cent for the friction.

F. P. BACON, President. C. L. FOUTS, Secretary.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY SWITCH.—Geo. Chalmers, San Juan, San Benito Co., Cal. No. 286,682. Dated Oct, 16, 1883. This new railway switch consists in the arrangement of levers operated by suitable deviees on the locomotive, from which, through intermediate mechanism, motion is transmitted to the switch, or throw-rails, to connect them with the side or main track, this arrangement being for the purpose of operating all the levers upon one side to keep a straight or main track, and all the levers on the other side to connect the throw-rails with the sidings. The object is to provide a switch in the operation of which the greatest simplicity exists, thereby lessening the liability of accidents, both on account of construction and the difficulty of acquiring the knowledge of its operation.

FASTENING PAPER BAGS.—Albert W. Angier, S. F. No. 286,758. Dated Oct. 16, 1883. This is a device for securing the mouth of bags when closed; and it consists in the provision of a flexible metal plate secured to the inner part of one of the sides in such position as to lie within the mouth of the bag, the said plate being so formed as to permit the upper corners of the bag to be folded laterally against it, and then to be folded over upon itself, and upon the laterally folded corners, thereby securely closing the mouth of the bag.

ACOUSTIC TELEPHONE.—B. N. Botts, Paso Robles, San Luis Obispo Co. No. 286,680. Dated Oct. 16, 1883. These improvements consist in the construction of the diaphragm of either a transmitter or a receiver, and funnel-shaped mouth piece in connection with said diaphragm, whereby it is rendered operative. The object is to perfect a simple and effective telephone.

PUMP VALVE.—Frank Stock, Jr., San Jose, Santa Clara Co. No. 286,742. Dated Oct. 16, 1883. The improvement in pump valves consists in a means for permitting and accomplishing the rotation of valve, whereby it may wear more evenly and free itself of sand and grit.

TWO-WHEELED VEHICLE.—Jacob Price, San Leandro, Cal. No. 286,733. Dated October 16, 1883. The improvements consist in a novel construction of the body of the vehicle and a means for leveling the same to suit the height of animals of different sizes which may be used.

SAFETY HOOKS.—Eward H. Smith, Rutherford, Napa Co., Cal. No. 286,739. Dated Oct. 16, 1883. This is a novel hook, which may be opened to connect or attach to any object, and afterwards closed, so as to prevent its becoming detached.

EYES brighten, cheeks become rosy, muscles gain strength by the use of Brown's Iron Bitters.

INFORMATION WANTED.—Information is wanted of Wm. Erskine, who has been living near Hailey, Alturas county, Idaho Territory, for two years past. His wife has not heard from him since last Spring. He was President of the Miners' Union of Silver City, Idaho, five or six years ago. Any news of him would be thankfully received by Mrs. Hannah Erskine, of Nevada City, Cal., or R. H. McDonald, Los Angeles, Cal.

Know

That BROWN'S IRON BITTERS will cure the worst case of dyspepsia.

Will insure a hearty appetite and increased digestion.

Cures general debility, and gives a new lease of life.

Dispels nervous depression and low spirits.

Restores an exhausted nursing mother to full strength and gives abundant sustenance for her child.

Strengthens the muscles and nerves, enriches the blood.

Overcomes weakness, wakefulness, and lack of energy

Keeps off all chills, fevers, and other malarial poison.

Will infuse with new life the weakest invalid.

37 Walker St., Baltimore, Dec. 1881.
For six years I have been a great sufferer from Blood Disease, Dyspepsia, and Constipation, and became so debilitated that I could not retain anything on my stomach, in fact, life had almost become a burden. Finally, when hope had almost left me, my husband seeing BROWN'S IRON BITTERS advertised in the paper, induced me to give it a trial. I am now taking the third bottle and have not felt so well in six years as I do at the present time.
Mrs. L. F. GRIFFIN.

BROWN'S IRON BITTERS will have a better tonic effect upon any one who needs "bracing up," than any medicine made.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 27th day of September, 1883, an assessment (No 4) of ten cents (10c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 528 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Monday, the 19th day of November, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. MARTIN, Secretary.

OFFICE—Room 6, No. 528 California Street, San Francisco, California.

NOTICE TO CREDITORS.

ESTATE OF ROSEMOND GREENWOOD, deceased—Notice is hereby given by the undersigned executor and executrix of the last will and testament of Rosemond Greenwood, deceased, to the creditors of, and all persons having claims against the said deceased, to exhibit them with the necessary vouchers, within four (4) months after the first publication of this notice, to the said executor and executrix, at the office of E. W. Blaney, Esq., attorney-at-law, No. 526 Montgomery Street, the same being the place for the transaction of the business of said estate, in the City and County of San Francisco.

Dated at San Francisco, the 24 day of October, 1883.

GEORGE SPAULDING,
MARY WILLIAMS,
Executor and Executrix of the last Will and Testament of ROSEMOND GREENWOOD, deceased.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizor, an improved revolving barre crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

F. A. HUNTINGTON,

No. 45 Fremont Street, San Francisco, Cal.

CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of these mills on the Whiddon mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.
The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

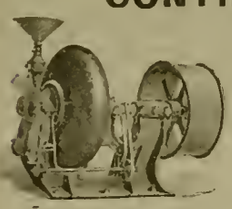
Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.



CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

PRENTISS SELBY, - - Superintendent

The California Perforating Screen Co.

All kinds of Quartz Screens, slot or round holes; zinc, copper and brass for flour and other mills. BOOK & WAGNER, 123 and 125 Beale St., S. F.

JOHN L. BOONE, Attorney and Counsellor-at-Law,

Rooms 7, 8 and 9,

320 California Street, San Francisco.

(Over Wells, Fargo & Co.'s Bank.)

Special Attention Paid to Patent Law.

N. B.—Mr. J. L. Boone has been connected with the Patent business for over 15 years, and devotes himself specially to Patent litigation.

San Francisco Cordage Factory.

Established 1856.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

WM. BARTLING. HENRY KIMBALL

BARTLING & KIMBALL, BOOKBINDERS.

Paper Rulers & Blank Book Manufacturers

505 Clay Street, (southwest corner Sansome),

SAN FRANCISCO.

COPP'S U. S. MINERAL LANDS,

Laws, Forms, Instructions and Decisions,

Has no surplus verbiage. Contains Dr. Raymond's Glossary. Explains how to examine mining titles. Contains numerous court decisions. Gives the Public Land Commissions Codification, and gives many an improved forms Price—Full law binding, extra paper, $3.00.

For Sale by DEWEY & CO., San Francisco.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

(ESTABLISHED 1864.)

THE MOREY & SPERRY MINING MACHINERY COMPANY,

Successors to MOREY & SPERRY,

Manufacturers of all Kinds of

Mine and Mill Machinery

WAREROOMS: 92 & 94 Liberty St., New York.

WORKS: Newburg, - New York.

The Foundry and Machine Shop having been enlarged we are now prepared to make from the most improved patterns QUARTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.

SIMPLE, EFFICIENT and DURABLE

The Balls revolve **Horizontally** without friction. 5 ft. size, weight 7,000 lbs., and does more work than 15 Stamps, 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating Pans and Separators, Roasting Furnaces, Hoisting and Pumping Machinery, Engines and Boilers, any size required. Hydraulic Giants and Pipe, Ore Cars, Ore Buckets, Safety Cages. The Hand Power Two-stamp Mill, weight 280 lbs. THE EUREKA WIRE ROPE TRAMWAYS, Concentrating Riffles for Mills and Hydraulic Sluices.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

GOLD QUARTZ and PLACER MINERS'

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought, or gold separated for low percentage of result.

SEND FOR PRICE LIST.

SAN FRANCISCO PLATING WORKS,

653 & 655 Mission St., San Francisco, Cal

E. G. DENNISTON, Proprietor.

ANTI-SCALE COMPOUND

Manufactured by RICKARD & DURDEN.

We guarantee that, with proper use, this Compound will remove and prevent all

INCRUSTATION IN STEAM BOILERS.

Ten years trial, in widely separated localities, has demonstrated the value of this invention, and its applicability to different qualities of water. Reference cheerfully furnished to any one wishing same.

☞TEN POUND SAMPLE BOX FURNISHED FREE ON APPLICATION.☜

BERRY & PLACE MACHINE CO., Sole Agents,

No. 8 CALIFORNIA STREET, S. F.

IRON PLANING

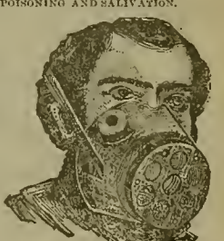
DONE FOR THE TRADE.

STRAIGHT, TRUE, AND AT REDUCED PRICES.

WHEEL CUTTING TO ORDER.

SAN FRANCISCO TOOL COMPANY, - - - - 11 STEVENSON ST., S. F.

N. W. SPAULDING'S

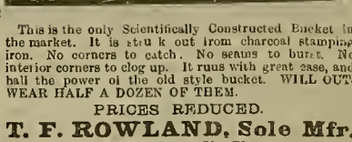


PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

Patent Life-Saving Respirator.

PREVENTS LEAD POISONING AND SALIVATION.



Invaluable to those engaged in dry crushing quartz mills, quicksilver mines, white lead corroding, feeding thrashing machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and, if not satisfactory, the price will be refunded. Price, $3 each, or $30 per dozen

Address all communications and orders to

H. H. BROMLEY, Sole Agent,

43 Sacramento Street, San Francisco, Cal.

THE BEST IN USE!

This is the only Scientifically Constructed Bucket in the market. It is struck out from charcoal stamping iron. No corners to catch. No seams to burst. No interior corners to clog up. It runs with great ease, and hall the power of the old style bucket. WILL OUTWEAR HALF A DOZEN OF THEM.

PRICES REDUCED.

T. F. ROWLAND, Sole Mfr.

Brooklyn, N. Y.

H. P. GREGORY & CO., Agents, San Francisco, Cal., carry a stock of all sizes.

RICHARD C. REMMEY, Agent,

Philadelphia Chemical Stoneware Manufactory,

1100 East Cumberland St., PHILADELPHIA, PA.

Manufacturer of all kinds of Chemical Stoneware —FOR— Manufacturing Chemists.

Also Chemical Bricks for Glover Tower.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

"DUNCAN"

ROCK DRILL!

FOR MINES, QUARRIES, ETC.

J. CUYAS, Agent,

10 Park Place, - - New York.

Foundry Notes.

The Union Iron Works are busy at work on the buildings, etc., at their new premises at South San Francisco, near the Pacific Rolling Mills A shipyard and drydock will be included in the new plant. Some sixteen acres will be used. The plans, which we have examined, show that there are to be several extensive buildings, of which the boilermakers' shop will be 200 feet deep by 90 in width. In this there will be a traveling crane with a 55-foot span and a 35-foot lift. The smiths' shop will be 40 feet front by 200 deep, the pattern shop will be 50 feet front by 150 deep, and adjoining will be the supply shop, the dimensions of which will be 50x50 feet. The foundry on the right will be 90x200 feet, in which will be a traveling crane with 50 feet span and 25 lift. The core-room is 40x40 feet, and the brass foundry and coppersmiths', 40x45 feet. The machine and erecting shops each will be 40x200 feet, in which will be a traveling crane with 40 feet span and 25 lift. Next to this is the machine shop, 40x200 feet, and the erecting shops, 55x200 feet. The traveling crane here has a 55 foot span and 35 lift. Adjoining will be a machine shop 40x130 feet, and in the front of which will be situated the company's offices, occupying a space 40x70 feet. From the works will be run out two railroad tracks to a wharf on one side, and on the other to the drydock. It is intended that iron and steel vessels can be built at these shops in addition to the general foundry business now carried on. The plant will be the most extensive on the Coast.

At the Globe Iron Works they now make a specialty of another mining appliance in addition to the Dyer Cannon-Ball Crusher, being engaged in the manufacture of Andrews' new amalgamator, an appliance exhibited at the recent Mechanics' Fair.

The Judson Manufacturing Company made the first heat last week of malleable iron, the first made on the Coast. They will shortly be able to furnish this very desirable material in abundance, intending to make malleable iron-work a specialty. The business of these works is gradually increasing.

The Pacific Rolling Mills, the largest iron establishment on the Coast, is busy at its usual miscellaneous work, and employing its usual complement of men. These mills furnished over 3,000 tons of iron and steel work for the Market street cable railroad, and are now engaged on work for other cable roads.

State Mining Bureau.

Although our State Mining Bureau is suffering from lack of funds, owing to the exhaustion of the appropriation and the meagerness of its receipts from the mining stock certificate tax, it has been very successful in collecting specimens. Mr. Hanks, the State Mineralogist, has shown great energy in this direction, and has enhanced the whole collection very materially. During the past year the museum has been rearranged. The state minerals are now arranged by counties instead of by scientific classification. Yet they are all properly labeled and described. One in search of any particular kind of mineral can readily tell whereabouts it is found.

The collection is by no means, however, confined to articles from this state. The whole coast is represented. During the Triennial Conclave a special exhibit was made, and a very creditable showing was the result.

Several of the counties have provided their own cases in which to display their minerals. Inyo, Toulumne, San Bernardino, Butte, Mono, and Humboldt have their own cases. The number of visitors has greatly increased this year, and the museum has been highly praised. The State Mineralogist's annual report will shortly be ready for distribution, and will contain a large amount of valuable information concerning our mineral resources.

THE OHMEN HIGH SPEED engine, made in this city, is a favorite with those that have used it. Recent improvements in the details of the mechanism greatly increase the economy and effectiveness.

PARKE & LACY, proprietors of the mining machinery depot in this city, are constantly adding to their already heavy stock of goods, and obtaining the agency of articles of improved character.

Early History of California Mining.

In the next issue of the PRESS we will commence the publication of a series of articles descriptive of scenes and events pertaining to gold mining in California, more especially during the earlier history of the business. More than the third of a century has now elapsed since the discovery of gold at Sutter's mill, a long time in an age so distinguished for activity and enterprise. The participants in the stirring events that followed that memorable incident are fast passing away, and in a little time there will remain few or none who were eye-witnesses of the same. Meantime, a new generation has come on the stage; a generation who know little about the hardships and trials, the tumult, dangers, stampedes and excitements, and, we may add, the mistakes and follies, incident to those early days. These more recent comers know not much concerning the deprivations and perils of an overland journey or life on the plains. They have never been much in the mountains, or out on the deserts beyond, where the extremes of heat and cold and hunger and thirst are to be endured, and sometimes attacks from Indians encountered. They have heard something of these things, of the rushes and excitements, the fires and floods, the massacres and popular movements, that occurred here in times gone by, but they have no very definite idea as to extent and gravity of these occurrences, or when and where they took place.

Even the first stock of miners, those who themselves took an active part in the momentous transactions, do not now remember many interesting incidents connected therewith, and would no doubt be glad to have their memories refreshed as to these particulars. How few of this class are able to tell us what has become of very many who, for one reason or another, were conspicuous in the annals of California mining. How many are able to tell us with much fullness and accuracy the story of Sutter or Marshall, or a score of others who were intimately connected with the discovery of gold in this state? How few know whether these men are dead or alive, and if still alive, where they are and how conditioned after so many years, and so many grand opportunities enjoyed!

To answer some of those and similar questions that naturally suggest themselves in connection with this subject, will be the object of this series of papers, rather than to give a detailed description of mining as a business, which latter has been already well performed by many able writers. What we stand more in need of just now is a consecutive account of the salient points and matters of special interest connected with the early history of mining as they transpired on this Coast. Personal reminiscences, the fate and fortunes of the pioneers, the traditions of the camp, etc., more concern both the departing and the on-coming generation than a dry recital of bullion produced and progress made in mining industries. As the task of gathering up this information and putting it in shape for publication has been committed to one tolerably conversant with topics of this kind, having been here from the first, and being withal a practical writer and practical miner, we count upon its being well performed.

THE GIANT POWDER COMPANY, the oldest of the companies making high explosives, now make three grades of powder under the Nobel patents, in which it is stated that all noxious gases have lately been overcome. Great improvements have lately been made at the work of the company to meet the demands for these favorite brands of powder.

THE DOW STEAM PUMP, made in this city, has been very successful since its first introduction, and now the works have as much as they can do to manufacture enough for the demand. Some very large ones have been made. They are found to be economical and reliable pumps wherever used.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. J. BARTELL—Santa Clara county.
H. W. FOLSOM—Los Angeles county.
C. E. CURTIS—Kern and Inyo counties.
A. S. DENNIS—San Mateo county.

About Obtaining Patents.

Patents are Virtually Contracts

Between inventors and the public. The consideration flowing from both parties to the contract is expressly fixed by statute. The Government requires the following consideration in every case: First, that an applicant for a patent shall disclose a new and useful improvement, of which he is the first and original inventor. Second, that the invention has not been patented, or published in a printed publication prior to the date of his *invention*. Third, that the invention has not been in public use, or on sale, more than two years prior to his application for a patent. Fourth, that the invention shall be properly described and claimed in the specification forming a part of the patent. Provided an inventor complies strictly with these conditions, the Government guarantees that the inventor shall have the exclusive right to make, use and sell the thing invented for the term of seventeen years.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, that it may afford him complete protection for his invention during the life of his patent.

Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. This question can often be answered gratuitously by us, immediately on receiving full information of the invention, by reason of our long and extensive practice as patent solicitors and editors and publishers of first-class, scientific and industrial journals, during the past 20 years and over. When the question of priority of invention is not so readily to be determined, it is generally best to make what is termed a "preliminary examination," by searching through the patent office reports among the patents in the class to which the invention relates, and referring to our extensive patent library, containing compilations of special classes of American and foreign inventions, mechanical dictionaries, scientific encyclopedias, files of scientific and mechanical newspapers, and an immense number of patent applications by inventors of this Pacific coast, carefully filed by this office since 1860.

If, by this "preliminary examination," the improvement is found to have been previously invented, our client will receive, for the small sum of $5 for the examination, a verbal or written report showing definitely whereby his invention has been anticipated, thereby saving him further expense and perhaps much time, useless delay, anxiety, etc.

To avoid all unnecessary delay, however, in securing patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with $15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately, and forwarded to the inventor for his signature. When the inventor receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps to be taken.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of $20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretence of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give a case up as long as there is a chance to obtain a patent. The Agency charge is from $25 to $30, or sometimes more, if the invention is intricate or complicated, or requires much labor. Drawings cost from $5 upward, according to their number and the time employed, and, if a model is sent, the express charges upon this and the papers must be added. The total cost, in addition to Government fees, rarely exceeds $40, and for this we do all we can without appealing the case.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients sufficient to make the experiment and also of the manufactured article itself, must be furnished.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are considered more satisfactory to the Patent Office than the old and more cumbersome system of storing up an immense bulk of almost numberless models.

Drawings or sketches, sufficient to illustrate clearly the invention, with a sufficient description to enable us to make a full set of perfect drawings for the Patent Office is all that we require. A model will answer our purpose as well; however, in cases where the inventor can more easily furnish it for our use.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings There are thousands of existing patents in which the improvements are but partially or very poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had the invention been fully portrayed by artistic and skillfully executed drawings. Again, when patents of this character are brought into court, the uncertainty and ambiguity of the drawings enable the opposing experts to mystify the judges as to the construction or combination of parts intended to be covered by the patentee. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken that the invention is fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

In the Patent Office

The application is assigned to the Examiner having charge of the class to which the invention relates. The case must then take its turn with others in the order of filing, and in due time is carefully examined to test the novelty of the invention. If the examiner fails to find anything that anticipates the invention, a patent is immediately allowed, provided the specification and claims are drafted in proper form. Should the Examiner find a prior patent which, in his opinion, anticipates one or more of the claims in the application, a letter or rejection is sent to the attorney in charge of the case; and, if the attorney coincides with the views of the Examiner, the claims rejected are erased. In preparing applications for patents, an attorney should be careful to familiarize himself with the class of inventions to which the application pertains, so that the specification and claims may be drafted as nearly perfect in the first instance as is possible. This course saves much time in prosecuting the application to a patent.

When claims are improperly rejected on patents which do not anticipate the spirit or wording of the claims, proper steps are immediately taken to convince the Examiner of his error. This is done, in most part, by personal arguments, as the differences in construction, operation, function and results are more readily discovered and appreciated by an oral presentation of the facts than can possibly be done by relying solely on written arguments. In order that the Patent Office record of the patents shall be complete, an oral argument is generally supplemented by a manuscript brief, that others, in examining the files at any future time, may clearly comprehend the points as taken by the Examiner and attorney in prosecuting the case to patent.

In addition to our own personal attention to the interests of our clients here, we have, for over 12 years past, had constantly in association with us in Washington, one of the ablest legal counselors and ablest of practitioners in patent business in this country, who carefully attends in person to our business at the Patent Office, and has attained success in a most marked degree.

Perfect Claims.

The value and force of a patent are dependent on its claims. A patent may disclose to the public the most important and valuable invention, and yet the claim be of such meager scope that the patent is actually worthless. When the claims of a patent are so loosely drafted that infringers can flood the market with improvements, differing from the improvement disclosed by the patent only in slight changes in construction and arrangements of parts, such a patent is valueless to the owner, as it fails to afford him that exclusive and complete protection guaranteed by the Patent Laws. Hence it is that the greatest care, skill and perseverance are required, first, in properly drafting the claims in the first instance, and second, in prosecuting the application before the Patent Office, and maintaining the rights of the inventor to claims as broad and sweeping as the invention will warrant. This latter is no easy task. The Examiners of the Patent Office serve in the capacity of attorneys guarding the interests of the public. It is their sworn duty to exercise the greatest care and watchfulness, that patentees do not secure claims of greater scope than they are justly entitled to. It is but natural that Examiners are sometimes in error as to just what scope should be accredited an invention. Although the Examiners act under honest convictions in cases where they refuse an inventor his just rights, yet it is the duty of the attorney to maintain the claims of his client, if he is convinced that they are just and proper. To succeed in this requires the display of tact firmness and ability; and when the Examiner is made to see that the inventor is honestly and fairly entitled to the claims which have been rejected, he will almost invariably recede from his former action, and allow the case.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. (continuously editors and publishers of the MINING AND SCIENTIFIC PRESS, nearly from its early commencement in 1860) offer comparatively far better facilities to the local inventors of the Pacific States and Territories than are possessed by any other agents in America. Members of the firm give personal attention to the applications entrusted to their care. They have been longer in practice in patent soliciting than most agents who are still personally engaged in the business. They have secured more U. S. and foreign patents in the past 20 years (with very few exceptions) than any firm still existing. Their practice has been so successful and long continued, that the great majority of inventions on this side of the American continent have been patented through their agency, thus affording them great and valuable experience, by those the information of the true principles and points of novelty in the inventions, whether general in character or peculiarly local to this coast.

The extensive business combination and experience of this firm, is undoubtedly one of the most fortunate in existence for affording inventors prompt and reliable advice, and the best possible facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation that is best calculated to widely inform the class of readers most especially interested in the subject of his invention.

Saving of Time Etc.

Inventors on this coast will find that owing to our familiarity with inventions and local affairs of this coast, we can more readily and fully comprehend their wants, and thus save much of the time ordinarily consumed in preliminary writing back and forth when distant agencies are employed.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat; and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee is $10 additional.

To enable us to prepare caveat papers, we only require sketch and description of the invention.

Rejected Applications.

Inventors who have rejected cases (prepared either by themselves, or for them by other agents), who desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so.

A Worthy Journal.

It is probably not necessary to call the attention of our readers to the character of the contents of the PRESS of late, nevertheless it is a satisfaction to do so. We have been giving a large amount of original correspondence recently, from our traveling and local correspondents, and our engravings of mining machinery and appliances have been new and very valuable to our readers. Within the past few months we have given a great many engravings and descriptions of appliances of the highest interest to the miner and metallurgist. The articles in this week's PRESS, with full illustrations, are of great scientific and practical value, and no doubt will be appreciated by all.

It is our aim to obtain from every possible source all reliable information on such topics as will interest the miner, metallurgist and mechanic. In fact, the MINING AND SCIENTIFIC PRESS is the only mining paper published which makes a specialty of illustrating and describing the details of mechanical appliances of mining. Bound volumes of the PRESS are of a far more practical value than most books, inasmuch as so wide a range is covered, and all the latest appliances described.

In addition to these things, all the current mining news is given, and a record of scientific and mechanical progress each week. It is gratifying to us to know that these efforts of the publishers are appreciated by the readers. The impartial judgment of any intelligent man will lead him to appreciate the PRESS, should he but glance over the columns of a few numbers. The assistance of old subscribers is of great advantage to the paper, and we shall be very glad to have it whenever opportunity offers.

THE seized goods of Donohoe, the San Francisco banker, will be released upon the payment of the duties, amounting to $1,628, and the further payment of costs and expenses, not yet figured up.

Scientific and Technical Associations.

The following are the more important scientific and technical associations in San Francisco.

California Academy of Sciences.

Meets 1st and 3d Mondays of each month at 7:30 P. M., at Academy's building, southwest corner California and Dupont streets. Rooms open daily from 9 to 4. Visitors free. Crocker-Stanford natural history collection in Mercantile Library Hall, No. 214 Bush street. President, Professor George Davidson, U. S. Coast and Geodetic Survey, Appraiser's building, Sansome and Jackson. Secretary, Charles G. Yale, editorial rooms MINING AND SCIENTIFIC PRESS, 111 Clay. W. G. W. Harford, Director of Museum, in Academy's building.

Mechanics' Institute.

Rooms and Library 31 Post street. Library contains 33,000 volumes. P. B. Cornwall, President, 609 Harrison street. Horace Wilson, Librarian.

Geographical Society of the Pacific.

No. 414 Post street. Meets 2d and 4th Mondays of month. Professor George Davidson, President, Appraiser's building, corner Sansome and Jackson. C. Mitchell Grant, Secretary, at Society's rooms.

California Pharmaceutical Society and College of Pharmacy.

Fulton street, between Polk and Van Ness avenue. Quarterly meetings. Emlen Painter, President, 511 Seventh street. Fred Grazer, Secretary, 1114 Howard.

Miners' Association.

No. 320 Sansome. Hamilton Smith, Jr., President. Walter A. Skidmore, Secretary.

California State Geological Society.

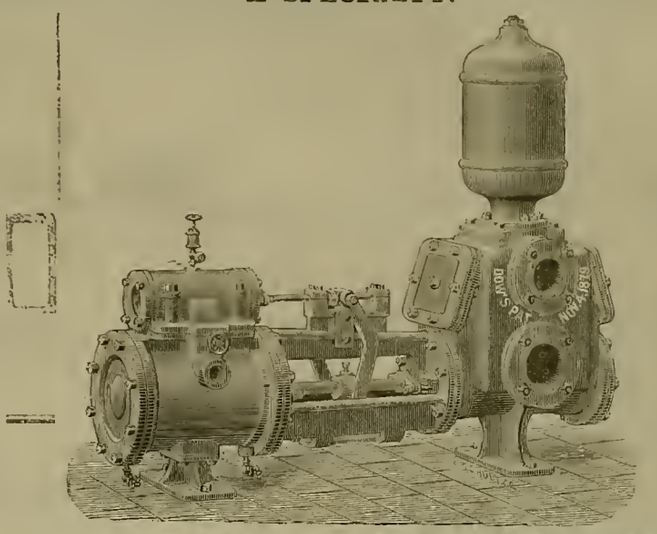
Rooms at State Mining Bureau, 212 Sutter street. Meetings 1st and 3d Tuesdays of Month. H. G. Hanks, President, 212 Sutter street. S. Heydenfeldt, Jr., Secretary, No. 309 Montgomery.

California State Mining Bureau.

No. 212 Sutter street, near Kearny. Free admission to museum from 10 to 3. Henry G. Hanks, State Mineralogist.

San Francisco Microscopical Society.

Rooms 120 Sutter street. Meets at 8 P. M. on 2d and 4th Mondays of the month. President, C. Mason Kinne, 122 California street. Secretary, E. J. Wickson, editorial rooms MINING AND SCIENTIFIC PRESS, 414 Clay.



IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

KEYSTONE BOILER WORKS.

HAMILTON, LEACH & MADDEN,

MANUFACTURERS OF

Boilers, Tanks and Plate Iron Work.

Office and Works,

Corner Main and Folsom Sts., San Francisco, Cal.

Table of Pressure allowable by U. S. Law on Boilers or Steam Cylinders 100 inches diameter, built of 30,000 T.S. Iron, expressed in pounds and decimals of a pound:

THICKNESS.		Double Riveting. PRESSURE.	Single Riveting PRESSURE.
1/16 inch....	.0625	12.499	10.416
1/8 "	.125	24.999	20.833
3/16 "	.1875	37.498	31.249
1/4 "	.25	49.999	41.666
	.26	51.999	43.333
5/16 "	.3125	62.499	52.083
3/8 "	.375	74.998	62.499
7/16 "	.4375	87.499	72.916
1/2 "	.5	99.999	83.333
9/16 "	.5625	112.498	93.749
5/8 "	.625	124.999	104.166
11/16 "	.6875	137.498	114.582
3/4 "	.75	149.998	124.999
13/16 "	.8125	162.499	135.416

To find the pressure for any diameter preferred, divide the "pressure," in column opposite the thickness of iron selected, by the diameter, and the quotient will be the pounds pressure allowable by U. S. Law, the right-hand figure being a decimal in all cases. Deduct 10 per cent. for iron stamped 45000, or add 10 per cent. for iron stamped 55000.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and our other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power, possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.
It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.
While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacure or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

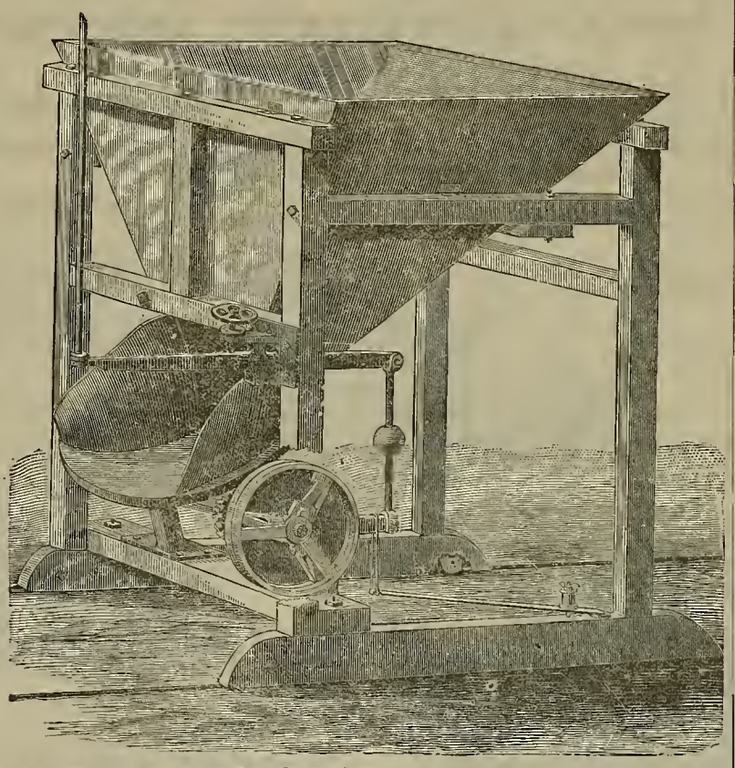
"Challenge" Ore Feeders.



OVER 1100 HAVE BEEN IN SUCCESSFUL OPERATION.

Awarded First Premiums at the Preceding and last Industrial Fairs of the Mechanics' Institute of San Francisco.

TWENTY PER CENT. MORE ORE CRUSHED WITH FIFTEEN PER CENT. LESS WEAR OF IRON THAN BY THE OLD METHOD OF HAND-FEEDING.

The opposite cut illustrates the recently-introduced Grip and Boring Attachment, which replaces the Weight originally used and result in an obvious improvement.

The practical operation of the large number of these machines now in use demonstrates the fact that the principle upon which a perfect Ore Feeder *must* be constructed is that of a *carrier* and not that of a shaking table. Uniform feeding is no possible upon the latter plan. The ore must be *evenly carried* upon a steadily-advancing plane or table to the line or point of discharge, and there be simply dropped. Jerky or spasmodically-acting contrivance will not answer the purpose for feeding wet or sticky ores, nor for the ores of mines where they may change from sharp quartz to an intermixture material of quartz and earthy matter.

These Feeders are in Successful Practical Operation in the Following Quartz Mills, and are giving Perfect Satisfaction to their Managers.

The Manufacture of Charcoal in Kilns.

The manufacture of charcoal in kilns was declared many years ago, after a series of experiments made in poorly constructed furnaces, to be unprofitable, and the subject is dismissed by most writers with the remark, that in order to use the method economically the products of distillation, both liquid and gaseous, must be collected. T. Egleston, Ph. D., of the School of Mines, New York, has read a paper on the subject before the American Institute of Mining Engineers, from which we extract as follows: As there are many

Silver Districts in the West

Where coke can not be had at such a price as will allow of its being used, and where the ores are of such a nature that wood can not be used in a reverberatory furnace, the most economical method of making charcoal is an important question.

Kilns for the manufacture of charcoal are made of almost any shape and size, determined in most cases by the fancy of the builder, or by the necessities of the shape of the ground selected. They do not differ from each other in any principle of manufacture, nor does there seem to be any appreciable difference in the quality of the fuel they produce, when the process is conducted with equal care in the different varieties; but there is a considerable difference in the yield and in the cost of the process in favor of small over large kilns. The different varieties have come into and gone out of use mainly on account of the cost of construction and of repairs. The object of a kiln is to replace the cover of a meiler by a permanent structure. Intermediate between the meiler and the kiln is the Foucauld system, the object of which is to replace the cover by a structure more or less permanent, which has all the disadvantages of both systems, with no advantages peculiar to itself.

The kilns which are used may be divided into the rectangular, the round, and the conical, but the first two seem to be disappearing before the last, which is as readily built and much more easily managed.

All Varieties of Kilns

Are usually built of red brick, or, rarely, of brick and stone together. Occasionally, refractory brick is used, but it is not necessary. The foundations are usually made of stone. There are several precautions necessary in constructing the walls. The brick should be sufficiently hard to resist the fire, and should therefore be tested before using. It is an unnecessary expense to use either second or third quality fire-brick. As the pyroligneous acid which results from the distillation of the wood attacks lime mortar, it is best to lay up the brick with fire-clay mortar, to which a little salt has been added; sometimes loam mixed with coal-tar, to which a little salt is also added, is used. As the principal office of this mortar is to fill the joints, special care must be taken in laying the bricks that every joint is broken, and frequent headers put in to tie the bricks together. It is especially necessary that all the joints should be carefully filled, as any small open spaces would admit air, and would materially decrease the yield of the kiln. The floor of the kiln was formerly made of two rows of brick set edgewise and carefully laid, but latterly it is found to be best made of clay. Any material, however, that will pack hard may be used. It must be well beaten down with paving mauls. The center must be about six inches higher than the sides, which are brought up to the bottom of the lower vents. Most kilns are carefully pointed, and are then painted on the outside with a wash of clay suspended in water, and covered with a coating of coal-tar, which makes them waterproof, and does not require to be renewed for several years.

The kilns were formerly roofed over with rough boards to protect the masonry from the weather, but as no special advantage was found to result from so doing, since of late years they have been made water-proof, the practice has been discontinued.

The wood used is cut about one and a fifth meters long. The diameter is not considered of much importance, except in so far as it is desirable to have it as nearly uniform as possible. When most of the wood is small, and only a small part of it is large, the large pieces are usually split, to make it pack well. It has been found most satisfactory to have three rows of vents around the kiln, which should be provided with a cast-iron frame reaching to the inside of the furnace. The vents near the ground are generally five inches high—the size of two bricks—and four inches wide—the width of one—and the holes are closed by inserting one or two bricks in them. They are usually the size of one brick, and larger on the outside than on the inside. These holes are usually from .45m. to .60m. apart vertically, and from .80m. to .90m. apart horizontally. The lower vents start on the second row of the brickwork above the foundation, and are placed on the level with the floor, so that the fire can draw to the bottom. There is sometimes an additional opening near the top to allow of the rapid escape of the smoke and gas at the time of firing, which is then closed, and kept closed, until the kiln is discharged. This applies mostly to the best types of conical kilns. In the circular and conical ones the top charging-door is some times used for this purpose. Hard and soft woods are burned indifferently in the kilns.

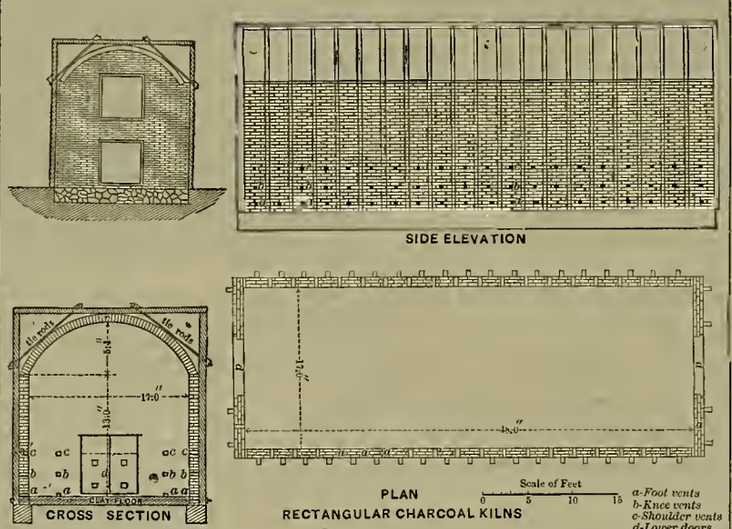

Fig. 1.

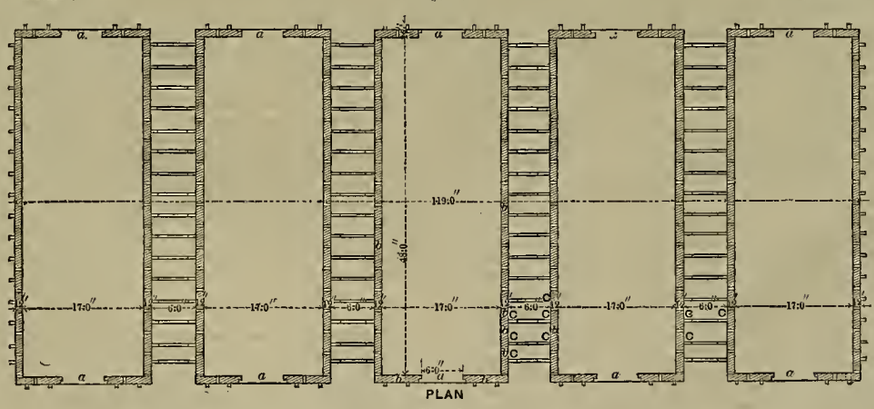

Fig. 2.

RECTANGULAR KILNS FOR THE MANUFACTURE OF CHARCOAL.

Hard-wood coal weighs more than soft, and the hard variety of charcoal is usually preferred for blast furnaces, and for such purposes there is an advantage of fully 33⅓ per cent, or even more, in using hard woods. For the direct process in the bloomaries, soft-wood charcoal is preferred. It is found that it is not usually advantageous to build kilns of over 160 to 180 cubic meters in capacity. Larger furnaces have been used, and give as good a yield, but they are much more cumbersome to manage. The largest yield got from kilns is from 50 to 60 bushels for hard wood to 50 for soft wood. The average yield, however, is about 45 bushels. In meilers, two and a half to three cords of wood are required for 100 bushels, or 30 to 40 bushels to the cord. The kiln charcoal is very large, so that the loss in fine coal is very much diminished. The pieces usually come out the whole size, and some times the whole length of the wood.

The rectangular kilns were those which were formerly exclusively in use. They are generally built to contain from 30 to 90 cords of wood. The usual sizes are given in the table below:

	1	2	3	4
Length	50	40	40	48
Width	12	15	14	17
Height	12	15	18	18
Capacity, in cords	55	70	75	90

1 and 2. Used in New England. 3. Type of those used in Mexico. 4. Kiln at Lauton, Mich.

The arch is usually an arc of a circle A kiln of the size of No. 4, as constructed at the Michigan Central Iron Works, with a good burn, will yield 4,000 bushels of charcoal.

The vertical walls in the best constructions are 12 to 13 feet high, and 1½ brick thick, containing from 20 to 22 bricks to the cubic foot of wall. To insure sufficient strength to resist the expansion and contraction due to the heating and cooling, they should be provided with buttresses which are 1 brick thick and 2 wide, as at Wassaic, New York; but many of them are built without them, as at Lauton, Michigan, as shown in the engraving. In both cases they are supported with strong braces, from 3 to 4 feet apart, made of round or hewn wood, or of cast iron, which are buried in the ground below, and are tied above and below with iron rods, as in the engraving, and the lower end passing beneath the floor of the kiln. When made of wood they are usually 8 inches square, or round, or sometimes by 8 inches, placed edgewise. They are sometimes tied at the top with wooden braces of the same size, which are securely fastened by iron rods running through the corners, as shown. When a number of kilns are built together, as at the Michigan Central Iron Works, at Lauton, Michigan, shown in the plan view, only the end kilns are braced in this way. The intermediate ones are supported below by wooden braces, securely fastened at the bottom. The roof is always arched, is one brick, or eight inches thick, and is laid in headers, fourteen being used in each superficial foot. Many of the kilns have in the center a round hole, from sixteen to eighteen inches in diameter, which is closed by a cast-iron plate. It requires from 35 M. to 40 M. brick for a kiln of 45 cords, and 60 M. to 65 M. for one of 90 cords.

A MANUFACTORY of vegetable oils, starch and bluing is being erected in Los Angeles.

Shoshone County, Idaho.

The statement made in some of the papers that the recently discovered rich placer district in the Cœur d'Alene Mountains is situated in Shoshone County, Idaho, recalls some passages in the history of this, the oldest county in the territory, and some of its more salient physical features. Shoshone County was an organized county in Washington Territory before Idaho had being as a distinct political community, and was represented in the Legislature of Washington Territory during the years 1861 and 1862. Early in 1863 the Territory of Idaho was organized, with the capital at Lewiston, and here the first and second sessions of the Idaho Legislature were held. The first permanent occupation by white people of the region now covered by Shoshone County was in the autumn of 1860, when what was then known as the Oro Fino placer gold mines were discovered. The fame of these "diggings" soon spread far and wide, and thousands from the older placer fields of California and Oregon congregated in the new El Dorado. The county embraced at the beginning nearly the entire region watered by the numerous tributaries of the north and south branches of the Clearwater. A portion of the county lies north and east of this water-shed, taking in a portion of the Cœur d'Alene range of mountains, and some of the country drained by the tributaries of the Cœur d'Alene River. It is in this range of mountains that the new placer district has been discovered, though we have not yet been able to verify the fact that the new mines are located within the boundary of Shoshone County. The surface of the entire region of which we write is high, and for the most part rugged and mountainous, with numerous streams of every size, below that of the main river, penetrating the mountains, through channels that for long sections of their course have so little fall that much difficulty was experienced in many cases in getting the water to flow with sufficient rapidity to wash the gold from the earth and gravel by the first rude processes applied hy the miners. All the river and creek bottoms and the flanks of the mountains are covered by a dense growth of the finest pine, fir, cedar, hemlock and spruce timber. The lumber interests alone in that old county, when fully developed, will constitute a source of great wealth. On the plateaus near the south branch of the Clearwater there are extensive bodies of fine agricultural and grazing lands, which have recently been surveyed, and which are being rapidly appropriated by settlers.

The mines on the Oro Fino Creek and its tributaries have been continuously worked since 1860, and though the long series of successive excitements and the constantly decreasing output have continued to diminish the population from year to year, the good old county has continued to hold its head up bravely under all adverse circumstances, keeping up its county organization, maintaining its financial credit, and keeping its representation in the Legislature, the comparatively few people remaining there showing a wonderful faith in the old camp, and a determination to stay with it to the last. One peculiarity of this old placer region is, that though numerous rich and extensive placers have been found and worked, and though the entire region has been exhaustively prospected for gold-bearing quartz lodes, very few of these have been found, and fewer still that have been made to pay the cost of working. But there have been great excitements from time to time caused by rumors of rich quartz discoveries. What will long he remembered as the Robinson ledge, and which has long since been classed among the exploded humbugs and myths with which prospectors have often deluded themselves and others, was mentally located at different times in many different parts of the county, where it was persistently but vainly searched for hy eager prospectors. Now, we don't yet know that the new placers are within the boundaries of the old county, but it would be poetic justice for them to be found there, and we hope that the event will prove it to be so. And since the gold found in the district is of the character known as coarse gold, with indications of not having been washed down from a great distance, future labors of the prospector may reveal the existence of rich quartz lodes, and who knows that the Robinson ledge itself may not yet he found. It is a remarkable fact that in auriferous mountain regions, particularly where the country is covered with dense forest, no matter how long the country has been occupied or how thoroughly it may have been explored and prospected, new and rich discoveries are always possible, and continue to be made. The discovery of these rich placers, in whatever county they may be located, will give a fresh impetus to prospecting, and will be certain to bring to light other placers long hidden in the recesses of the Cœur d'Alene and Bitter Root Mountains. These discoveries and the almost certain prospect that the Northern Pacific will push a branch through some pass in the Bitter Root Mountains and down the Clearwater to Lewiston, give a most cheering outlook for old Shoshone, which will cause the recreant old tramps who left her so long ago to fight her own battles wish they had remained to share her good fortune.

THE Los Angeles and San Gabriel railroad has secured the right of way for nearly the whole distance of the projected line, some twenty-eight miles. Active operations will probably be commenced in about six weeks.

The Ontario Resumes Dividends.

The Ontario Mining Company has resumed dividends. The mine is in Utah, and the office of the incorporation is in New York, where on the 15th instant a dividend of 50c per share for September was declared, payable on the 31st instant. This dividend is numbered 88 in the official notice. At the time of the suspension of dividends last February, our record showed 86 dividends paid, amounting to $4,900,000. The dividend declared on the 15th amounts to $75,000, which, when paid, the New York *Journal of Commerce* says, will swell the total to an even $5,000,000. Our record shows 87 dividends, of $4,975,000. Where the other dividend of $25,000 came in we are unable to tell. Since the suspension of dividends last February, important and expensive improvements have been made at the mine. It was found necessary to reduce the expense of handling the water, and so a drain tunnel was ordered to he constructed, tapping the mine at the 600-foot level at shaft No. 3. The tunnel is 5,763 feet long and 5 hy 7 in the clear, exclusive of lumber flume on the floor 18 inches deep by 3 feet wide, through which water 9 inches deep is running like a mill race. This tunnel cost from $25 to $30 per foot, and it is estimated that it will effect a saving of $100,000 per year in the handling of the water from the mine. This is the most important enterprise ever undertaken by a single silver metal bearing mine. It it now believed that the water question is under control for the next two or three years. Of course these outlays of money and labor would not have been undertaken if there had not been a reasonable prospect that the situation warranted the same. The Ontario has always been regarded as one of the best managed silver mines in the country. Haggin and Tevis of this city have been large owners from the commencement. The output of the mine above the 600 foot level has been about $14,000,000. It is estimated that there is enough ore between the 600 and 800 foot levels to keep the present milling capacity employed for two or three years. Shaft No. 3 will be sunk to a depth of 1,000 feet. The company has purchased a large area of adjoining ground, much of which is known to contain metal-bearing rock. There is therefore a long lease of active usefulness for the Ontario mine in prospect.—*Bulletin.*

Opinions About the Cable Cars.

The cable car system of street railways, now in use in Chicago, has lately received a good deal of commendatory notice from parties who ought to know what they are talking about, and whose opinions ought to be entitled to weight. The correspondent of the London *Times*, who accompanied the Villard party on the famous "last spike" driving expedition, mentioned the system in a letter to the great English journal as one which possessed many important advantages, and the Chicago cable cars are models of elegance, convenience and safety.

This was no undeserved compliment to the cable cars, which are as a matter of fact what the *Times* correspondent described them to be; and the prejudice which for a while existed in the minds of many Chicagoans against the cable system has gradually yielded to the logic of events. This method of passenger transportation could not now be dispensed with, and the underground cable, which has been thoroughly tried, found to he reliable under all circumstances, and which requires for its operation no unsightly structures on the public thoroughfares, is not likely to be superseded by the concentrated lightning motor, or any elevated railway project. The Congress of Street Railwaymen, which was in session at the Grand Pacific Hotel last week, appeared to be almost unanimously of the opinion that the cable system was the only one that would prove a successful competitor of the old conservative mule power in propelling street cars, and Superintendent Holmes's historical report of the inauguration and satisfactory working of his twenty-odd miles of line was listened to with marked attention. The enterprise met with a considerable, but not very intelligent, opposition in its inception and infancy, but its intrinsic merits were at last appreciated, and gained for it substantial public favor. The cable cars, by the by, are the only ones in use on any of the city roads, so far as the writer is informed, which are so constructed that a passenger stumbling in getting on or off could not fall beneath the wheels.—*Chicago Inter-Ocean.*

MINING COMPANY ENJOINED.—On Monday last, in the Superior Court of Sutter County, Judge Keyser rendered a decision in the debris suit of Allen S. Noyes against the Spring Valley Hydraulic Mining Company, granting the perpetual injunction prayed for. The company's mine is at Cherokee, Butte County, and one of the largest in the state. Noyes owns land in Butte Creek Basin injured by the debris and water from defendant's mine. This does not mean that the company must stop work, but that they must buy this man's land to dump tailings on, as they have bought 16,000 acres before for the same purpose. It will be a good investment, as the land will pay by and by.

Taxation of Inventors and Use of Patent Fund.

Our readers well know that Congressional attention has been yearly invited to the above subject, and kindred questions affecting the rights of intellectual property, with inadequate results. It is now evident that Congress can give that attention to the subject which its importance justifies only hy personal appeal to its individual members hy their constituents, supplemented hy a numerously signed memorial to Congress itself. In view of the assemblage of so many of those specially interested in such questions at the various expositions and conventions, and the near approach of the Congressional session, it is proper to give publicity to a draft of a memorial such as is now being circulated. It is as follows:

Memorial.

To the Honorable the Senate and the House of Representatives of the United States in Congress assembled:

The undersigned, manufacturers, inventors and other citizens, interested in the progress of the useful arts, respectfully represent:

That to the law granting to inventors, for a limited period, the exclusive use of their discoveries, the country is indebted for much of its pre-eminent prosperity;

That the surplus to the credit of the patent fund, amounting, on the first of July, 1883, to $2,500,000 in round numbers, unappropriated to any of the ostensible purposes of its exaction, constitutes a special tax upon a useful class of citizens, mostly "poor but making many rich," without constitutional sanction, and neither expedient nor just;

That the fees for granting patents of invention should not, as they have done for many years past, greatly exceed the expenses incurred in examination and other procedures called for in such grants;

That the surplus could and should be applied, under proper safeguards, to means for increasing the usefulness of the patent office, both to inventors and the public;

That among these means are adequate digests and indexes of improvements in the various useful arts, for use of the examining corps, and of inventors and others in the principal industrial centers; increase of the working force of the patent office, on salaries that shall secure and retain competent service; and enlargement of its present cramped and inadequate accommodations.

Under the present law, previous grant of foreign patents operates to limit the terms of one granted here for the same invention to that of the earliest expiring foreign one, possibly because it was thought that the American public should not he called on to pay for what was free elsewhere. The provision, while oppressive to inventors of the more important improvements, fails to accomplish the ostensible object of its enactment in the great majority of American inventions, which, because of this clause, are never patented outside of the United States, and are therefore free abroad from the first. We ask the repeal of this worse than useless clause.

Legislation is asked that shall enable amendment, after due public notice, and within reasonable time after grant, of a defective specification, without on the one hand bringing into subjection machines already constructed, or, on the other hand, releasing previous trespasses on claims remaining unchanged in the amended specification.

It is submitted that a commission be established, with authority to order such Patent Office expenditures, not in excess of receipts, as such commission may from time to time deem fit. It is requested further that the President he authorized to enter into all arrangements with other powers for the international protection of rights of inventors, such a movement having already been made by the English government in the patents, designs and trade-mark act of 1883.

The Postal Telegraph.

Facilitating the inter-communication of intelligence of all kinds is one of the secrets of recent rapid progress in civilization and enlightenment. It is one of the hopeful signs of the times that each reduction in the cost of transmitting information prepares the way for the cheapening, because the people are ready for it and avail themselves of its benefits. The Inter-National Postal Congress, which has made the letter rate five cents between nearly all the more enlightened nations of the earth, is a great step forward. The reduction of the letter rate in this country to two cents is another mark of progress which is generally appreciated, and will show its benefits in the great increase of correspondence. These aids to business and friendly communication are excellent, but they should be merely regarded as preparing the way for future facilitation of transmission.

It is high time that the advantages of electric communication were brought within the reach of all, and used for the interchange of less restricted messages than at present. As we advance in enlightenment, time becomes a more and more valuable commodity, and we can ill afford to wait for communication which creeps along in the mail cars. It should speed upon the wings of the lightning; and to secure this essential quality of speed, the public should he no longer required to pay a great profit to a few fortunate men who happen to hold shares in telegraph companies.

The time has come when the government should control and conduct communication by wire as well as by rail. The system should be extended far beyond present telegraph facilities, and the cost should he vastly reduced. This can only be done hy bringing the whole system under the government control, that it may be engrafted on the postal system. This project is now engaging the attention of publicists, and there should he a public appreciation and demand for such facilities made known. Monopoly of any thing of a public need is an unfortunate thing, but monopolizing a means of communication is perhaps the worst of all for the country. By postal telegraph the government can free the people from existing exactions of a monopoly, and it should not be long deferred.

Searching for Water.

Now that the population of our state is increasing so rapidly, the unsettled land that is watered from running streams is seen to be of very limited area. As a natural consequence, it is steadily appreciating in value, and property-owners are using every means to increase their supply of water. This is notably true in Southern California, all along the line of the Santa Ana River; at the mouth of the Canyon, where the underground flow has been appropriated to water a portion of Redlands; at the Riverside point of diversion, where the same thing has been done; and at Bedrock Canyon, where a pile dam is being constructed to secure additional water for the settlements of Orange and Santa Ana; also, at the month of San Gabriel Canyon, and in the bed of the Los Angeles River. In this connection we print an article taken from the *Herald*, of Los Angeles, bearing date 22d of September:

The Good Work Begun.

Only a few months ago the *Herald* contained an argument in favor of tunneling the Sierra Madre Mountains for water, and repeated the necessity of the project in several issues, with suggestions of a location where such a tunnel could be made with success.

To day we have the pleasure to announce that the good work has been begun in several places. Mr. James Noel, who has a fine body of land between Cucamonga and Etiwanda, has begun a tunnel six and a half feet high and five feet wide, in the mountains at the upper side of his land. Mr. Clark, who is making the same, was in town yesterday for giant-powder, tools and provisions, and reports a length of about fifty feet. About ten miles to the west of this tunnel the Chaffey Brothers are preparing to make another tunnel, to water a part of the Ontario Colony. In the rear of Sunny Slope, Mr. C. C. Hastings has begun a tunnel, on the upper side of his tract. Mr. Abbott Kinney has made a short tunnel that is yielding a fine stream of water for his ranch. Next west of the Kinney tunnel, Hon. J. F. Crank, Wm. Allen and Mr. A. Brigden have commenced a tunnel on the west side of Precipice Canyon, and have completed about forty feet of the same. It is yielding water quite freely already. About three miles west of this tunnel Messrs. Graham, Lowell, Gano and Jewett have run a tunnel into the mountains about fifty feet, and secured a beautiful stream ten inches wide and an inch and a half deep, which is carried into a reservoir near the mouth of the tunnel. The water in this tunnel comes up out of the bottom of the tunnel and in from the sides. The present supply is ample for all their needs, so that work for the present has been suspended. It was found that the water increased steadily as the tunnel was lengthened. If more water should be needed they will extend their work further into the mountain. Another recommendation in favor of this water supply is the clear and pure condition of the water as it merges from the tunnel, and the further fact that the riparian rights, as enunciated by the Supreme Court of California, can not apply to these precious streams.

When the tunnel was made for the Southern Pacific railroad at San Fernando, quite a stream of water was found where there had been no surface indications, and this stream is still steadily flowing. Every inch of water thus secured and carried to hitherto unproductive land is adding its quota to the wealth of our state; every additional acre that can be brought under cultivation is so much towards the prosperity of all; and those who are engaged in these enterprises, and carry them forward to a successful issue, certainly merit the thanks of the community.

THE MECHANICS' INSTITUTE of this city is now in a very flourishing condition. There has lately been a large increase in membership, and the recent exhibition was very successful from an industrial as well as a financial point of view. In works of reference the library is especially rich, while it is also liberally supplied with ordinary library material.

ON the headwaters of South Creek, a tributary of Little Lost River, in the northeastern part of Alturas County, Id. T., there is said to be a volcano, with a true crater, emitting hot fumes all the time, charged with sulphurous, suffocating gases. There is a horse trail leading from Cedarville via South Creek to the volcano.

MECHANICAL PROGRESS.

Poor Machinery.

Poor machinery in the saw mill, planing mill, or wood-working establishment of whatever name, says the *N. W. Lumberman*, is a delusion and a snare. It usually costs less to start with than first class work, and this difference in price is a gilded hook that catches many a man who has not learned that the best in the long run is always the cheapest. A machine that is not well made, of the best material, and that will not do the work required of it in the best possible manner, should not, in any mill or factory, be considered worth the room it occupies. The mind of the man who tends such a machine is constantly harrowed. He is on the lookout for something to break or go wrong in some way, and if it does not, the final result, the work turned out, in which an operator takes, or ought to take, the liveliest interest, is unsatisfactory, and a standing reflection on the shop or mill that produces it.

The honest manufacturer in the machine line is a jewel, and it is doubtful if his efforts are appreciated to the extent they deserve.

A saw awhile ago burst in Michigan, the pieces flying through the air like so many bullets. Owing to the best of luck nobody was injured, though the chances of death to some of the employees in the mill were probably ten to one. The sawyer declared the break was caused by a flaw that would have been detected in the process of manufacture by careful workmen; and so thoroughly does the owner of the mill believe that such was the cause, that a saw of another manufacture will grace his mandrel henceforth and forever, providing his mill runs so long. A manufacturer of machinery may easily cover a defect with paint or polish, and think he is doing a smart thing in a business way; but if he keeps his eye on his machine from year to year, and at the same time keeps his ears open, some day he may hear of an accident that involved loss of property and life, and then possibly he may think of the slight defect that he so ingeniously concealed. We don't know of a good place in existence for cheap poor machinery, except the bottom of the sea. If there, no one will use it; consequently it will neither do any one bodily injury nor assist a man, by its poor work, in getting a bad reputation.

Improperly Locating Machinery.

Apropos to the above is the following from a correspondent of the *Milling News:* During the past decade I have been in a great many mills, and have seen not a few that were admirably adapted to the business of handling and dressing lumber at a minimum of expense and labor; and I have occasionally seen one that seemed to me to have been built and arranged to see how much could be put on each job and yet have every one about the place work hard all day. In many of them it seemed as though machines had been left where they were dropped by the drayman on their first arrival. The grindstone was where the ripsaw belonged; the resawing machine should have been placed where the flooring machine was; the surface planer was where nothing should be, except perhaps a pile of lumber, and so on all the way through.

A great difference can be made in the production of work by the proper or improper location of the different machines; I mean so placing them that all the various processes, including ripping, cross-cutting, resawing, surfacing, matching and molding, can be done with the least possible amount of handling. Every time a piece of stuff is touched, carried, or handled unnecessarily, some of the profits, if there are any in the business, stick to it. It is not a hole in which to drop money, but a good surface on which to stick the needful. As an illustration, when boards are dressed on a double-surfacing machine, at a very close figure after the cost of power, grease, and help are included, where would the profits go to if the same work were done on a single surfacer feeding at the same rate? You simply stick it on the boards with good "stickem." It will stay there, and don't forget to keep this fact in your cranium.

Steel, Then and Now.

The sword was, as the ancient chronicler said, "the oldest, the most universal, the most varied of arms, the only one which has lived through time. All people knew it; it was everywhere regarded as the support of courage, as the enemy of perfidy, as the mark of commandment, as the companion of authority—as the emblem of sovereignty, of power, of force, of conquest, of fidelity, and of punishment." And all this has steel abandoned—to become rails! Look at what it was, and what it is. Its aspect was brilliant; its habits were punctilious; its manners were courtly; its connections were patrician; its functions were solemn; its contact was ennobling; even its very vices were glittering, for most of them were simply defects of its superb qualities. It is true that it was sometimes cruel, and that its process of action was distinctly sanguinary; but those reproaches apply to all other weapons, too. Throughout the ages it grandly held up its head and haughtily bore its name. It lost no caste when it allied itself with lance and dagger, with battle ax and helm, for they were of its natural kindred; and even when, in latter days, it stooped to generate such lowly offspring as razors, lancets, knives and needles, the world saw no real abasement in the act, for the chivalrous blade was still the image which represented steel to man.

But now its whole character has changed; now it has thrown aside its gallantry, its grace, its glory; now it has foresworn its pride for profit, its pomp for popularity. Steel is now bursting coarsely on the earth at the rate of thousands of tons a month. It is positively being made into steam engines, and cannons, and ships, and all sorts of vulgar, heavy, uncomely, useful objects. Worse than all, it is becoming cheap! Steel cheap! The steel of old, the steel of legend and of story, the steel of the palladin and the chevalier, the steel of the noble and the brave, the steel of honor and of might, the steel that was above price, that knew not money and cared naught for profit—that steel is no more. It has been driven contemptuously out of sight by matallurgie persons called Bessemer and Krupp, and others, and these destructive creators have put into its place a nineteenth century substance exactly fitted to a mercantile period, but possessing no title whatever with time or fame.

POSSIBILITIES OF MACHINERY.—Those who think, if there are any such, that the possibilities of labor-saving machinery, says the *Manufacturers' Gazette*, are nearly exhausted, and that the whole field of art and industry in which it may be advantageously employed has been already covered by inventive genius, are greatly mistaken. Wonderful as have already been the achievements of human ingenuity in this direction, there is no reason to doubt that it is destined to continual progress in the future as in the past, or that the coming triumphs of mind over matter will be greater and more fruitful of grand results than any which have been consummated. Reasoning from analogy and precedent, we can come to no other conclusion. Twenty, or even ten years ago, who could have guessed or believed that the difficult and complicated processes which are now every day being wrought out by machinery, in various braches of manufacture, would ever be possible? Thus it is that the unsolved problems of one generation of men become the accomplished facts of the next. And who shall say that the objects which now seem to us beyond the range of probability may not be successfully attained by those who are to come after us?

NATIVE WOODS FOR DECORATIVE PURPOSES.—A writer in the *Railroad Gazette* gives some ideas about our native woods and their uses that may be of value to our mechanics. He says that white wood is valuable because it remains where put, notwithstanding the fact that its surface is perhaps as easily affected by water as almost any wood. In Virginia there are tracts formerly known as the "Wild Lands," in which much fine forest remains—tracts where the tulip poplar, or the white wood, shows trees that will square two feet for sixty feet of length, and where the beech, oak, the hickory and the sugar-maple have never been touched. One of the finest tracts of the much used cherry tree is found along the eastern edge of the outcroppings of the coal measures of the northern part of this region. Those who have been accustomed to see the miserable, caterpillar-eaten specimens of this tree would be surprised by the splendid trees found growing in these forests—trees three and four feet over the stump and sixty feet upward before reaching a limb.

A MUSICAL ELECTRICAL WHEEL.—An experiment by Prof. H. S. Carhart is as follows: A disk of sheet iron was pierced with two circles of quarter-inch holes concentric with the disk, the number of holes in the two circles being thirty-two and sixty-four respectively. On one side of the disk was placed a horseshoe magnet, with its poles very near the rows of holes; on the other side were arranged two corresponding induction bobbins. The circuit was completed through a telephone and either bobbin at pleasure. Upon rotating the disk rapidly, a clear musical sound was produced in the telephone, the pitch rising with the rapidity of rotation. Moreover, the bobbin opposite the circle of sixty-four holes gave the octave above the other, and each gave a note of the same pitch as was produced by blowing a stream of air through the corresponding holes.

A DRIVING belt made for an Eastern cotton mill is a monster power transmitter. It is 220 feet in length, double, making 458 feet of leather three feet wide, or 1,374 square feet. When it is remembered that only about twelve square feet of the ordinary hide can be used in making belting, it may be calculated what a drove of cattle would be required to produce this one belt.

STEEL RAILS.—A manufacturing engineer writes to *La Metallurgie*, Paris, claiming that the success of rolling steel rails depends on the temperature at which the steel is rolled. He states, from his own experience, that bars which were finished at a bright-red heat, and which were recognizable after cooling by their blue tint, were more fragile under tests by striking or flexion than those finished at a lower temperature.

SCIENTIFIC PROGRESS.

Electric Furnace—Interesting Experiments.

The electric furnace possesses two great advantages—the temperature which can be produced is only limited by the refractory resistance of the crucible, and the heat is developed in the materials which are to be melted, without first traversing the recipient.

An interesting series of experiments was recently made with one of these furnaces in Paris, which are referred to by *L'Electricien*, as follows:

Six pounds of forged iron were submitted for twenty minutes to the action of the arc, and the metal was then poured into a mold. It was found to be crystalline, and could not be forged. This difficulty may be remedied by adding a little manganese before pouring out; but the reason of this action is not understood. Three-quarters of a pound of copper were melted in charcoal dust for an hour, at the end of which time all but three-quarters of an ounce had been vaporized. The persons who were present did not perceive any disagreeable effects from the atmosphere which they were obliged to breathe. Eight pounds of platinum were entirely melted in about a quarter of an hour. A half pound of powdered tungsten was submitted to the action of the electric arc, in a clay crucible. Very dense fumes escaped, and a cavity about a half inch deep formed at the summit. The metal appeared to have been melted to only a very slight depth below the cavity. The unmelted portion was covered with very beautiful crystals, which, when examined by a microscope, were found to be prismatic, but they were not very uniform. The crystals were evidently formed by the slow cooling of the distilled vapor. Experiments were tried with various other metals, showing that the quantity of any given metal which can be completely melted in an electric furnace, and the time required for the fusion, depend upon the interval between the point of fusion and the point of vaporizing, as well as upon the thermal conductibility of the metal. Thus it happens that platinum is melted much more easily than steel, and in a much greater quantity for the same expenditure of energy.

Late Observations on the Planet Jupiter.

Among the papers read before the recent meeting of the American Association for the advancement of science was one upon the planet Jupiter, by G. W. Hough, of Chicago, in which he remarked that the rapid motion of revolution of the planets, by changing the positions of the markings on the surface to our line of sight, makes great apparent differences in their shapes and sizes. This has perhaps been the occasion of reports of sudden and great changes upon the surface. The changes are not sudden, but are gradual; and many of the features are permanent. Minor changes are constantly in progress in the equatorial belts.

The author recently observed the belt drifting down toward the red spot, but, although it partly surrounded it, they did not coalesce, and the spot forced a scallop into the belt, a very curious phenomenon. The author saw a satellite pass over this red spot, though the satellites are not visible when on the white part of the disk. He had also had a chance to compare shadows of satellites on the disk and on the spot, and both are dark.

The red spot has seemingly retrograded during the past four years; that is to say, the rotation of Jupiter has seemingly increased from 9 h. 55 m. 33 s. to 9 h. 55 m. 38 s. The future observer should attend more carefully to what he sees, and theorize afterward.

RECENT CHEMICAL APPLICATIONS OF ELECTRICITY.—Among the electrical processes which encourage great hopes for the future, those which bear upon the industry of chemical products and the preparation of metals have been somewhat overlooked. It is well to remember that the dynamos, in the estimation of their inventor, were designed to take the place of batteries in galvanoplasty before they were applied to the numerous uses of lighting and of mechanical transmission. Industrial chemistry will undoubtedly draw advantages from the resources which are offered by the electric current. The last international electrical exhibition showed how to prepare metals, chemically pure, to extract the precious metals from their salts or their alloys, to treat ores, and to form some special combinations for dyeing. While the French houses were spreading before our eyes the wonders of artistic galvanoplasty, Letrange published his researches upon the preparation of zinc, Wohlwill displayed a wonderful collection of metals deposited electrically, and Goppelsroder, with the modesty of a savant, presented specimens of colors obtained by electrolysis.—*L'Electricien.*

AZOTINE.—M. Heddehault has discovered a method of preparing soluble wool from tissues in which wool and cotton are combined. When subjected to a current of superheated steam under a pressure of five atmospheres, the wool melts and falls to the bottom of the pan, leaving the cotton, linen, and other vegetable fibres clean and in a condition suitable for paper-making. The melted wool is afterwards evaporated to dryness, when it becomes completely soluble in water, and is called azotine. The increased value of the rags is sufficient to cover the whole cost of the operation, so that the azotine is produced without cost. It contains all its nitrogen in a soluble condition, and can, therefore, be compared to dried blood, which is worth 2.50 francs per kilogramme of nitrogen. M. Ladurean regards this discovery as one of great interest for agriculture and mechanical industry.—*Soc. Industr. du Nord.*

MAGNETISM OF STEEL AT DIFFERENT TEMPERATURES.—It is well known to electricians that the best steel makes the best permanent magnet. But the magnetism of steel depends on how hot or how cold the metal is. For example, steel loses its magnetism if subjected to a temperature of 100 below zero it also loses its magnetism when heated to yellow heat; that is, between red and white heats. Soft iron, when heated red hot, is not attracted by a magnet. Prof. Poloni has recently been experimenting upon the influence of heat on the permanent magnetism of steel. He finds that the diminution of magnetic intensity by the increase of temperature in the steel bar has no rigid relation to the increase of electric resistance in the metal itself. Indeed, while the permanent magnetism diminishes with increasing rapidity up to a temperature of about 200° (328° F.), and then less rapidly up to 300° (508° F.), becoming inappreciable at red-heat, the electric conductibility of the iron diminishes uniformly with the increase of temperature.

MODIFICATIONS OF GLASS AT MODERATE TEMPERATURES—Messieurs Crafts and Pernet have presented some recent communications to the French Academy relative to the changes which glass tubes of thermometers undergo when they are heated for a long time. In manufactories of printers' ink, where oils are heated to a temperature of 270° (538° F.) for many days, the most accurate thermometers often become so changed as to indicate errors of ten or more degrees. J. Salleron calls attention to similar changes at much lower temperatures. The areometers which are employed in sugar refineries where molasses is treated by osmosis, are plunged for many days in liquids which are heated to 95° (203° F.). Although this temperature is below the boiling point of water, it is sufficient to completely modify the areometers and to soften the glass enough to make them untrustworthy.—*Comptes Rendus.*

CONCENTRIC LAYERS OF TREES.—It is generally thought that the age of trees may be known by the number of concentric layers. This principle, however, is not applicable to tropical trees, as is shown by the following facts: When M. Charency visited the ruins of Palenque, Mexico, in 1859, he cut down several trees in order to get at the great pyramid. On revisiting the same locality in 1881, the shoots which had grown from the stumps, and which must all have started nearly at the same time, varied greatly in the number of their concentric layers. On one he counted 230; and the entire number had been formed inside of twenty-two years. On one occasion he cut off the branch of a shoot which he judged to be about eighteen months old, and counted eighteen concentric layers, one for each month of growth.

SPECTROSCOPIC ESTIMATES OF ATMOSPHERIC ABSORPTION.—Cornu has been led, by his investigations of the atmospheric absorption of the ultra-violet rays, to examine the relation between that phenomenon and the absorption of the visible rays. His attention was especially directed to Brewster's dark bands, which are generally known as telluric rays, the intensity of which increases with the thickness of the atmosphere which they traverse. He finds that the amount of absorbing matter may be estimated by the sines of the altitude from the sun at which a telluric ray has the same intensity with a metallic ray. Hence may be deduced a very simple method for estimating, at any moment, the total amount of vapor which exists in the atmosphere.—*Comptes Rendus.*

ELECTRIC CURRENTS PRODUCED BY NITRATES.—M. Brard has communicated some investigations to the French Academy, which give the following results: 1. On plunging a red-hot carbon into a bath of melted nitrate, an energetic current flows from the bath into the exterior circuit; 2. The melted nitrates become very fluid, and, like greasy bodies, lubricate the heated bodies with which they come in contact; 3. In order to obtain a current, it is not necessary to plunge the carbon into the nitrate bath, but it suffices to place a metal capsule containing some grains of the melted nitrate upon the burning carbons. M. Brard is continuing his experiments with a view to apply them practically in the production of light and heat.—*Les Mondes.*

DURATION OF WOOD AND IRON UNDER WATER.—German engineers are now engaged in removing the foundations of an old bridge built by Charlemagne, in the eighth century. The wood of the piles, used in its construction, although nearly 1,100 years old, is so well preserved that it can still be used in building; the iron, which was riveted to the posts, can also be used, since it is covered only with a thin layer of rust.

THE ÆTNA IRON WORKS have undertaken the manufacture of the Nevin patent ore furnaces. The proprietors of these works being experienced in metallurgical appliances, consider this furnace to be an excellent one, and feel assured it will give very satisfactory results. They intend introducing it more widely on this Coast.

BECAUSE of a great sum in the treasury and a rapidly increasing Assessor's valuation of property, the Texas Legislature has a special session next month to reduce the rate of taxation.

Mining Share Market.

Matters in the stock market have been very dull this week. Fluctuations have been slight; as soon as any ore stock starts up a little there are plenty of sellers, so no rises of any importance have occurred. The work of sinking the joint Union Consolidated and Sierra Nevada winze proceeds as rapidly as possible, but the rock is exceedingly hard and tough. It is a very diffieult matter to drill and blast it. However, the ore increases as sinking progresses and the sinking of the winze is watched with interest. At the Gould and Curry and Best and Belcher, on the 2500 level, a joint winze has been started on the line between the two mines, in east cross-cut, No. 1. This winze will be sunk to the 2700 level, if possible. The cross-cuts made to the southward on this level show that the vein is strongest to the north. In Gold Hill the several companies are taking out a considerable amount of ore in the aggregate, but none have yet put on a full force of miners, and will not do so until the mills on the Carson River can be run to their full capacity.

Bullion Shipments.

Contention Con., October 20th, $16,206; Mt. Diablo, 22d, $11,245; Horn Silver, 23d, $18,000; Ontario, 23d, $10,849; Hanauer, 24th, $12,500; Crescent, 24th, $2,100; Horn Silver, 24th, $12,000; Ontario, 24th, $5,166; Hanauer, 25th, $5,300; Horn Silver, 25th, $6,000; Ontario, 25th, $5,049; Hanauer, 26th. $2,783; Nevada, 26th, $1,650; Ontario, 26th, $5,107; Horn Silver, 26th, $12,000; Ontario, 27th, $4,650; Vienna, 27th, $1,521; Bullionville, 27th, $10,886; Horn Silver, 27th, $6,000; Ontario, 28th, $5,137; Vienna, 28th, $1,588; Horn Silver, 28th, $9,000; Bullionville, 28th, $2,501. The banks of Salt Lake City report for the week ending October 24th, inclusive, the receipt of $158,253.90 from the mines, mills and smelters, of which $156,153.90 was bullion, and $2,100 ore.

A BIG STEAL.—Speaking of the Cable mine, Deer Lodge County, Montana, the Heleua *Herald* says: In a comparatively small body of white quartz, of less than two tons weight, very nearly $80,000 was secured and made off with by a number of the men employed in the development force. Of this large amount of treasure only about $6,000 was recovered by the owners. The guilty one, caught, confessed to the theft, disgorged his part of the plunder, and implicated those who had shared in the robbery, and the amounts they, one after another, skipped the country with. This man was let go;—a condition to the confession and the giving up of his share of the stealings. His associates had scattered, and placed themselves beyond reach,—in the States, in Canada, and one at least put the sea between him and America. The theft was first unmasked by one or more of those concerned in it heedlessly sending numbers of rich specimens to Helena, where they were disposed of at high figures. For one of these quartz pieces of less than a pound weight a suit of clothes, with an overcoat added, were exchanged. Several of these rich and beautiful specimens of white quartz, with protruding gold upon all sides of them, adorn a number of Helena cabinets.

THE river Salembria, in Thessaly, anciently known as Peneus, has overflowed its banks, causing widespread devastation. One hundred houses have been destroyed and several lives lost. Larissa and the villages in its vicinity are surrounded by water.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—*Ledger*, Oct. 27: Last week a rich pocket was struck in the Iowa mine, at Sutter Creek, adjoining the Mahoney on the east. The mine has been operated on a small scale by A. Tibbetts and J. Tucker, with varying results. Last week they stumbled across a little bonanza, taking out in a short time gold worth from $12,000 to $17,000.

PLYMOUTH CON.—The Plymouth Con. Mining Co., on the 3d inst., declared its fifth monthly dividend of 50 cents per share, aggregating $50,000. Making a rough estimate of the running expenses, the two mines—Pacific and Empire—must be surrendering gold at the rate of over three-quarters of a million per annum.

NOTES.—John Poll has been working a claim in Murphy's Guleh. He lately had 12 tons of the ore crushed at the Oneida mill, which surrendered $9 per ton. The ledge is not more than a foot wide, but it is near the surface. The Zeile mill crushes from 100 to 125 tons of ore per day. Estimating the average yield at $8 per ton, including sulphurets, the product of the mine can not fall short of $27,000 per month.

DRYTOWN.—*Dispatch*, Oct. 27: We learn that Alvinza Hayward has purchased the Seaton mine at Drytown, and intends to work it on a more extensive scale than heretofore. Humphrey Reese of Sutter Creek has been placed in charge as Superintendent.

Calaveras.

TUNNEL RIDGE.—*Chronicle*, Oct. 27: J. F. Vieth, who owns the Mammoth hydraulic claim, on Tunnel Ridge, is preparing to have erected a 5-stamp gravel mill. There is rich gravel in the Mammoth, but some of it is cemented, requiring stamps to free the gold.

WEST POINT.—Cor. *Citizen*, Oct. 27: The Star of the West has stopped for a short time, until the owners get a new pump. Mr. Wiekham is building a 20-stamp mill for Mr. Richardson. The Scorpion mine, owned by Mr. Carey, is running. The Valentine mine, owned by Messrs Ayers and George, is not running at present. The Old Wood House mine is now running under the management of Mr. Desmond. The Champion mine is shut down.

MURPHY'S.—*Mountain Echo*, Oct. 24: The addition of one more Tustine pulverizer, making four, and one more Frue concentrator, making six, will, by using a 30 screen, make the capacity of the mill 40 tons per day. These screens will be used for the low-grade ore that has accumulated on the dump. A thousand tons were freed in a two weeks' run, which will pay $8 per ton.

Del Norte.

BIG FLAT.—Crescent City *Record*, Oct. 20: During the dry season the fitting up of the Big Flat mine for the coming winter has been going on. This is the best mining property near the coast in this county, and we shall expect to hear of a large amount of gold being taken out. Under the management of Paris & Lane, nothing has been left undone. Unlike the Boston Co., that first opened this mine and failed, they do not support 2 or 3 overseers and a number of "hightoned" bosses, but attend to their business themselves.

Mono.

MAY LUNDY.—Homer *Index*, Oct. 27: The May Lundy mine is turning out 420 tons of ore per week, but the snow-squall of Thursday caused a suspension of hauling, teamsters being afraid to venture up the mountain. At the mine stoping is being done in stopes 1 and 8 from the middle tunnel, 13 and 14 from the lower tunnel, between winze 1 and 2, 60 ft below, and from the south winze 1, 130 ft below the lower tunnel. All these stopes are looking well and carrying from 3 to 8 ft of ore.

GORILLA.—The Gorilla M. and M. Co. has laid in a large supply of ore at the reduction works, and the works were this week put in thorough repair. It is understood that the clean-up last Monday and bullion shipment on Tuesday were unexpectedly large.

STANDARD CON.—Bodie *Free Press*, Oct. 23: During the week there were shipped to the mills 1305 tons of ore. The bullion shipment was valued at $18,293.98. No work was done on the 1200 ft level during the past week, owing to the water having risen 12 ft in the shaft. At first the water gained on the pumps about 2 ft a day, but now the pumps are handling it as fast as it comes in.

Nevada.

MT. AUBURN MINE.—*Transcript*, Oct. 26: The mine up to two weeks ago looked badly, and the Eastern owners, concluding it would not pay to further prospect the ground, sent word on accordingly. The day before the letter was received, a new chute of ore was discovered. It had a very fine appearance, but the superintendent discharged 7 men until he had received further advices. He concluded to push ahead on the new discovery and stopped all other work. He has kept 10 men constantly employed. The ledge is considered to be the mother lode, and its discovery is considered of the most important character. On Wednesday last it was 4 ft thick and has the appearance of being rock of very superior quality. One of our best mining men examined it a few days ago and pronounces it as fine a prospect as any seen in this district.

MURCHIE MINE.—Supt. Tilley has been straining every point to find a large pay chute which he concluded must exist somewhere in that locality. On Thursday of last week he discovered the long looked for ledge at the bottom of the 700 level, the lowest depth the shaft had attained. Since then work has been prosecuted to the west on the ledge and it is a valuable property.

MAGENTA.—Grass Valley *Union*, Oct. 25: The existence of a ledge parallel to the Magenta has been known a long time, and on Tuesday, in running a tunnel from the ravine below the hoisting-works to draw off the surface water this ledge was encountered within 25 ft of the shaft, and found to be 4 ft in thickness, carrying galena and sulphurets and a showing in free gold. It is one of the best ledges that has been brought to light in many a day. The visitors all passed favorable opinions upon its appearance, believing it would yield from $30 to $40 per load.

Placer.

PENNSYLVANIA FLAT.—Placerville *Republican*, Oct. 20: A correspondent writing from the above camp, just over the line in Placer county, says of the Ralston brothers: The property consists of placer and hill mines, situated two miles from the mouth of Long canyon and four miles up the ridge, between the south and middle fork of the American, together with twenty miles of ditch. The water is taken out of the middle fork at the lower end of the Freneh meadows. The Ralstons have spent a considerable sum of money the past summer fixing up their mines. They have built a saw mill, barn and a commodious dwelling house. Mrs. Ralston, with her daughter and servant girl made the trip from Georgetown on horseback, over as rough a trail as is found in the mountains. The wire suspension bridge being put across the south middle fork by the Ralstons and some sheep men will be completed in about two weeks. This will enable them to travel between the mines and Georgetown at all seasons of the year.

BALD MOUNTAIN—The Bald Mountain mine at Roberts' Flat, twenty-five miles above Sunnysouth, is causing a flutter in mining circles, by the rich yield. It is said that no less than 40 ounces of coarse gold were taken out of a carload and a half of gravel, about two weeks ago. Among the owners are J. H. Neff and A. Dolt.

THE COPPER CO.—*Herald*, Oct. 20: Speaking of the California Copper mine located near the old Whisky Diggings in Placer county, the *Union* says that work at the mine is progressing very rapidly. The foundation timbers and the machinery are all on the ground, and hoisting and pumping by steam will soon begin.

Plumas.

THE COMING CAMP.—Greenville *Bulletin*, Oct. 24: There will be a big mining camp down on the east branch of the Feather River before long. The work of development is going on. An experienced mine foreman says that there is ore enough in sight at the Halstead mine to run 100 stamps during 20 years, and all of it will pay.

COPPER.—A new deposit of copper ore has been found by David Allen, in North Arm. Mr. Allen has prospected it over a length of 1,000 ft, and finds it to be at the surface from 18 inches to 3 ft in width.

EMERALD DISTRICT.—Quincy *National*, Oct. 27: A. B. Harvey, of Taylorville, gives us a very encouraging account of the mines in Emerald district, known as Lucky, S. No. 1 and No. 2. The tunnels show rich rock. Mr. Harvey, who is in charge of the mines, is fully prepared for winter, having all needed comforts for his men, and a dump-house which will contain 500 tons of quartz.

RICH GULCH.—A. D. Hallsted tells us that matters at the mine are in good shape. The lower tunnel is within 40 or 50 ft of the ledge. The work above has developed some very rich rock in the past week or two, and a vein over 2 ft in width, in the main ledge, shows gold throughout. The arastra is not yet running, but will soon be ready for work.

The Greenville *Bulletin*, as will be seen above, speaks of this mine as "the coming camp".

San Bernardino.

HUMBUG.—Calico *Print*, Oct. 27: There are between 3,000 and 4,000 tons of ore on the dump that will mill several hundred dollars a ton. Only 5 or 6 men take out between 30 and 40 tons a day. A blast was put in recently that broke up 400 tons of ore. It took nine days to reduce this to small pieces and wheel it to the dump. It was nearly all good ore. The drill hole was 12 ft deep. After the discharge of a blast the earth for 20 ft square looks as though an earthquake had filled it with cracks. Some of the assays go as high as $10,000 or $15,000 to the ton. While in the assay office belonging to the mine, we saw a button from a quarter-ounce assay weighed that amounted to $2,652.34.

THE STREAK.—Week before last we mentioned a rich strike made in the Oregon claim. This claim has been purchased by Messrs. Hasbrouek and others, and re-christened the "Streak." The discovery was made by Mr. Hasbrouck, while grading a road. The ore first taken out was very rich, but was not assayed, it being considered unnecessary. Some of the ore, considered to be second-grade, was assayed, with a result of $400 to the ton.

MORNING BROW.—Some fine ore is being taken out. The pocket first discovered was quite rich. About 1½ tons were sent to San Francisco, that netted the owners $300. A wagon-load of second-grade ore that it was thought would mill about $400 to a ton was sent to the Oro Grande mill, and yielded $1,300 a ton.

WATERMAN.—Calico *Print*, Oct. 20: There are 60 men at work in and about the mine. The lowest depth that has been reached is 430 ft. Preparations are being made to erect steam hoisting-works over the main shaft. The mill, 3 miles from the mine, on the line of the railroad, is running night and day. The dividends, after paying all expenses, amount to $560 per day.

Shasta.

WHISKYTOWN.—Cor. of *Courier* Oct. 20: The Shasta mine is worked steadily, and rich rock taken out. They have found in the north drift a 5-foot ledge of good milling ore, and are running a tunnel to tap the ledge. The Phœnix mine is not in operation. The Phœnix mill is running on ore from the mine. The mill is a 10-stamp water-power mill. The West End mine, bonded 6 months ago, has been rebonded for the same amount. Some good rock has been taken out. Work continues on the Red Rover. A good ledge has been found, and a road will soon be built to the Phœnix mill. The Bell and Woodward mine, several years ago supposed exhausted, has again come to the front with a 3-foot vein, paying from $15 to $100 per ton. The Banghart mine still continues in operation.

NOTES.—Cor. of Redding *Free Press*, Oct. 20: Quartz is still booming. Dan O'Neil will commence running his arastra in a few days. Middleton & Wolcott are still at work in their mine. Their mill is going only a few hours each day, owing to the scarcity of water. George Martin is at work on his ledge, and is getting very rich rock. Mr. Fleming has a fine ledge, 4 ft wide, and gold may be seen glittering all through it. Myers and Co. are building a road to their mine, and will erect a couple of arastras.

Sierra.

ALLEGHANY.—Downieville *Tribune*, Oct. 25: Chinese miners have been employed in the Rain-

bow mine at $2.50 per day in preference to white men at $3. The citizens are thoroughly aroused, and determined that Chinese labor shall not gain a foothold. Last Sunday a meeting was held. It was decided upon to organize a Miners' Union, and in a few hours over 50 signatures were obtained to a petition calling a meeting for that purpose Tuesday night.

ALASKA MINE.—The hoisting works of the Alaska mine, at Pike City, are completed. The new building is 82x35 ft and is very substantial. The boiler and engine were placed in position last week. It is expected to have every thing in shape to begin the work of pumping out the shaft next week.

BULLION.—One hundred and ninety-five ounces of gold have been taken out of the South Fork mine, at Forest City, by the Bald Mountain Extension Co., during the past two weeks.

Trinity.

BUCKEYE. *Journal*, Oct 27: Rowles & Diener are in 70 ft with their tunnel on the Skidmore lode, at the forks of Buckeye, which they expect to strike in 30 feet more at a depth of 100 ft. The ledge is rich on top, and widened as they went down. Tourtellotte & Smith have struck their ledge on Haylock Gulch, about a mile from the Skidmore, and found it 2½ ft wide and prospecting well.

TRINITY CENTER. Some good pay grit has been found on Fool's Gulch and Moore & Co. are fitting up their claim. Bloss & McCarey have made the most successful run they ever had. The China Co. back of town are doing very well. Dockery & Co. are running the Julien which had been shut down for some time, and have good prospects. Holland & Rumfelt intend working all winter on the east fork of Coffee Creek. This mine pays regular dividends.

Tuolumne.

HORSESHOE BEND.—Sonora *Democrat*, Oct. 27: In early days Bostwick's Bar, just below Horseshoe Bend on the Stanislaus river, was immensely rich in placer gold. A swarm of miners worked there, and took out vast sums. The river bed around Horseshoe Bend was also found to be exceeding rich, but little of the ground could be worked on account of the difficulty of handling the water in the river channel. The river bed now prospects splendidly everywhere. Just above the bend, at Reynold's Ferry, James Rolleri has built a wing dam, and is working a portion of the river channel by means of a derrick and China pumps. Although he has many disadvantages to encountered he is making from $8 to $10 per day to the hand. All the river channel between the ferry and Bostwick's Bar prospects equally as well as Rolleri's claim, and the distance is over 2 miles. Some parties have lately taken hold of the matter, and contemplate running a tunnel through the neck of Horseshoe Bend and turning the river. The distance to be run is 900 ft, nearly 400 ft of which would be an open cut. The engineers estimate that the tunnel can be put through for $15,000 or less. When the river is once turned 2 miles of the river channel, most of it virgin ground will lie bare for working.

SNELL MINE.—This mine, situated above Knight's Creek on the Stanislaus, is looking well. A shaft 100 ft in depth has been sunk. A drift has been run north from the shaft on the vein for 75 ft. About 200 tons of ore that prospects well is lying on the dump.

PATTERSON.—Some exceedingly rich rock, so report says, is being extracted from the Patterson mine. The quartz is said to be fairly alive with free gold.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Oct 27: The southwest drift on the 2700 level is being advanced in material of a promising character. It is now being turned towards the west. An east cross-cut is being run from the northwest drift on the 2700 level, and is showing some ore of a good quality.

UNION CON.—Are sinking the joint Sierra Nevada winze to the point at which will be opened the 3100 station. The ground is very hard and tough, making it very difficult to drill and blast. The ore still holds out strong at the bottom, and is being saved for reduction.

COMBINATION SHAFT.—The station for the new hydraulic pump is completed, and they are now leveling down the rock for the timbers on which the machinery will be set up. One week from to-day the time expires in which the machinery is to be completed by the contractors at San Francisco.

MEXICAN.—Are opening out and completing the connection between the raise from the 2900 and the winze down from the 2700 level. The north drift on the 3100 level is being extended at the rate of over 30 ft per week.

CROWN POINT.—Sufficient ore is being extracted to keep going the few stamps that can be run at the river mills. The extraction of ore will be increased as soon as there is sufficient water in the Carson River to run the mills to their full capacity.

BENTON.—The draining of the Alta also drains this mine. As the water will now soon be out, prospecting can again be proceeded with.

ALTA.—The water is pumped out to within 20 ft of the 2150, the lowest level. Once all the water is out, they will soon be in a position to resume prospecting.

BEST AND BELCHER.—Good progress is making in the joint Gould and Curry winze, just started in east cross-cut No. 1 on the 2500 level. It was yesterday down 15 ft. It will be sunk to the 2700 level.

IMPERIAL.—Good headway is making in the west drift recently started on the 600 level. It will pass through new ground for a long way before reaching the old workings.

SIERRA NEVADA.—The main north drift on the 2900 level has reached a point from which a raise will be made up to the 2700 level.

GOULD AND CURRY.—The new winze in east cross-cut No. 1 joint with Best and Belcher is down 15 ft. It will be sunk to the 2700 level.

YELLOW JACKET.—Some ore is being extracted right along from the sagebrush level. A large amount of ore can be extracted from the mine, once the mills can take and reduce it.

UTAH.—West cross-cut No. 2 on the 1350 level is passing into a promising formation of quartz, clay and porphyry. At this point the mine has been very little explored.

OPHIR.—Are extracting ore from the 150 level, which will pay for milling. It comes from the old fillings. Exploring drifts are still being run.

BELCHER.—Not much is as yet being done in the way of extracting ore, as the mills on the Carson River can run but a few stamps.

ANDES.—Are still extracting some ore from the north drift. The drifts from the winze show some fine-looking quartz.

CALIFORNIA.—Are repairing the joint Con. Virginia winze station on the 2500 level.

OVERMAN.—Some low-grade ore is still being extracted from the old upper levels.

CON. VIRGINIA.—Are repairing the joint California winze station on the 2500 level.

UNION SHAFT.—Are still casing the timbers at the 2300 station.

Belmont District.

BELMONT MINE—*Courier*, Oct. 20: The Belmont Mining Co. have expended a considerable amount of money in repairing the mill south of town and in building and fitting up the leaching works, which are as fine and complete as any works of the kind in Nevada. The following is a copy of the Superintendent's letter of October 20: No. 1 level is now 331 ft in length, showing good ore 4 to 6 ft in thickness the whole distance. Each day's work south shows ledge widening, and better ore, some of it assaying into the hundreds. South tunnel winze and all stopes in Laity ground yielding splendid ore. The mill will start in 3 or 4 days.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Oct. 27: The drift from the main cross-cut has been extended 10 ft, and is showing small spots and streaks of sulphurets. The sulphurets assay as high as $60 per ton. Quite an important development has been made on the first intermediate shaft level, where, in crosscutting to the south, a body of chloride has been encountered which looks very promising, and is now showing an average width of 3 ft, assaying from $40 to $70 per ton. A bullion shipment amounting to $6,395.19 was made on the 23d instant.

COLUMBUS CON.—The 150-foot level has shown no change. A quantity of very good ore is being extracted from the old stope on this level. A streak of ore giving good assays has been encountered in the face of the drift, which is considered very encouraging. The amount of ore being broken in the mine is quite extensive, but only ten tons have been hoisted. The assays from this ore average $175 per ton, and as soon as the arrangements for handling it on the surface are completed, a larger amount will be brought up each day.

MOUNT DIABLO.—The drift below lower winze No. 2 shows a wide ledge of quartz that is mostly barren. The stope near the center of the mine, between the second and third levels, is furnishing considerable $70 ore. Some very good ore is being extracted from the east end of the stope, and the ledge looks well. A bullion shipment amounting to $11,244.60 was made on the 22d instant.

Eureka District.

SILVER CONNOR.—Eureka *Sentinel*, Oct. 28: In the Silver Connor mine, probably the largest body of ore ever found in Prospect Mountain is now being developed. Twenty-four mules are employed in packing the ore to the Eureka Con. furnaces. This body of ore was discovered on the 250-foot level of the mine, and it has been raised on up to the 200-level. The main body has been stoped out 20 ft of its width and 20 ft of its height. It has also been cut through 10 ft on one side and 7 on the other, and as yet, neither top, ends nor sides have been reached. The ore runs in value at the rate of $60 per ton, some of it going as high as $167 per ton.

Railroad District.

WARNER & CO.—Elks *Free Press*, Oct. 26: Since the starting of the furnace at Railroad, Warner & Co. have made the following shipments of bullion to the Bank of California: 1,419 bars of bullion weighing 140,052 pounds. To-day they will ship 218 bars of bullion weighing 21,640 pounds, and 170 sacks of matte weighing 17,000 pounds. The approximate value of the bullion and matte thus far turned out by the furnace is $36,000.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, Oct. 25: Total length of drift north on the 300 level, 877 ft; progress during the week, 17 ft. No change to note, excepting that the flow of water has diminished to one-fourth of the usual amount. Have encountered one streak of very rich ore.

NAVAJO.—Cross-cuts, 650 level, have been extended east 61 ft and west 31 ft. Have started a power drill on this level to-day, and the cross-cuts will now be pushed ahead rapidly. The new pumps have been tested, and work satisfactorily. Have commenced hoisting ore to-day.

NORTH BELLE ISLE.—During the past week, work on the 300 level has been confined to timbering the drift, which has been completed. Expect to make the connection with Belle Isle within the next 10 days.

GRAND PRIZE.—West drift in the 400 level is in 95 ft. Have started an upraise to connect with the 300. Stopes in the 300 are producing good ore. Have commenced stoping above the 200 level.

ELKO CON.—Shaft No. 2 has been extended 11 ft during the week; total depth, 181 ft. The formation is heavily mineralized and carries small stringers of quartz.

ARIZONA.

MAMMOTH.—Prescott *Courier*, Oct. 23: This mine, which promises soon to outstrip the Comstock of Nevada, is in Silver Mountain district, 55 miles southwest of Prescott. The vast magnitude and richness of the Mammoth ledge, which consists of five locations, has been known for years, but little save assessment work has been done. Recently, the locators organized a company under the name of the Mammoth Silver Mining Co. In proportions the ledge is undoubtedly the largest mineral-bearing vein in the world. The exact length has never been ascertained, though it has been traced for a number of miles, and its width in many places is hundreds of feet.

UNITED VERDE.—At present there are 80 men at work in the mines and mill. The smelter has been in operation for about 60 days, during which time the value of the product, copper and silver, has been nearly $200,000.

DOSORIS.—*Miner*, Oct. 17: The shaft is down about 320 ft. The ore being taken out now averages from $1,000 to $1,500 per ton, and there is an immense body of it.

CONTENTION.—Tombstone *Epitaph*, Oct. 21: The foundation for the pumps is finally completed. The same is probably the heaviest and solidest piece of masonry ever erected in the territory. The material used is all cut granite. Some of the foundation rods are let in as far as 10 ft in solid mason-work. Rapid progress in putting the machinery in place is being made. There is no doubt that every thing will be ready for active service by the first of December.

COPPER QUEEN.—The Copper Queen, of Bisbee, has just declared another dividend of $125,000, and still the production is not falling off, and could very easily be largely increased.

COLORADO.

HUKILL.—Georgetown *Courier*, Oct 18: The Hukill mine, situated near Idaho Springs, was sold October 15th, at sheriff's sale. It was bid in by Mr. George McClelland, of the Idaho Springs Bank, for a sum over $5,000. Mr. McClelland in turn consummated a sale of this property to John W. Mackay, the Bonanza King of Virginia City, the purchasing price being $13,778.50.

SNOW DRIFT.—In the Thompson level, east of Good Hope Gulch, on the Snow Drift, a splendid body of rich ore has been cut. The pay streak measures from 12 to 14 inches of solid ore. A chunk weighing 162 pounds is on exhibition at Pollard's store; it mills 1,000 ounces silver per ton.

IDAHO.

BIG SMOKY.—Ketchum *Keystone*, Oct. 20: The Sarah, about 7 miles south of Vienna, has been developed by 4 miners since June 1st, and is now only awaiting cheaper transportation. A close estimate makes the expenditure in development work about $2,000, and the mineral in sight at least $10,000. Although not high-grade, the Sarah ore is abundant, and lies in one of the largest ledges in the country.

OPHIR.—The Ophir claim, on the headwaters of Boulder Creek, 20 miles north of Ketchum, is rapidly coming to the front. But little developed, it has already shipped 40 tons of fine carbonate and galena ores to the Philadelphia smelters, and the last lot of 9¼ tons sampled 200 ounces in silver, 1¾ ounces in gold, and 64 per cent lead. This property has been worked upon but 30 days.

VIENNA.—A big strike is reported in the Vienna mine. The Vienna bears surface indications of the greatest ledge yet discovered in the Sawtooth Mountains. Hundreds of tons lie on the surface over the Vienna Hill divide, at an elevation of 10,000 ft. The works are at an altitude of a little over 9,000 ft.

THE SMELTERS.—Ketchum *Keystone*, Oct. 17: The two 50-ton stacks at the Philadelphia smelters continue to run with success, and the bullion output is as usual. About 2,600 tons of bullion have been produced since the commencement of operations, and the total will probably be about 3,500 tons for the year.

IMPERIAL.—Milton Pinney is in from the Imperial mine, in Greenhorn Gulch, where he is working 15 first-class miners. He says that the greatest depth attained is 100 ft, but the vein is well defined and maintains its ore-bearing character throughout. It crops out for over a thousand feet. Over 300 sacks of ore, averaging 140 pounds weight, are on the dump, and the average daily yield is one ton.

STAR.—A miner who was in town from the Star mine a couple of days ago, stated that that property was looking better than ever, and that there were large reserves of ore in sight.

BONANZA.—*World*, Oct. 16: Wm. Hooton, from Bonanza, tells us a good clean-up was made from a crushing of Montana ore put through the Custer mill. A shaft is down on the Montana 350 ft. No stoping has ever been done. All the ore that has come from it was taken out in sinking the shaft. The mine continues to turn out high-grade ore. The Charles Dickens shows up splendidly. The arastra is running on ore from this, and a crushing is being put through the mill. A winze has been sunk 60 ft from the lower tunnel, through a 5-ft ledge with a 20-inch vein of high-grade ore. Pockets of wire and ribbon silver, carrying 30 per cent of gold, have been struck—almost the pure stuff—a little spar clinging to it. Assays of the tailings of the ore in the arastra run up to $80 per ton. There are 1,000 tons of ore on the dump. The Galatin Bros. and Jas. Hooper are at work in the Whale. The Custer Co. has worked out the Custer mine, and are now at work in the Unknown. The Unknown is on top of the hill, and the Custer slide, which yielded between $2,000,000 and $3,000,000, broke loose from this. Silver predominates in all the mines of the Yankee Fork or Bonanza country, the bullion assaying about 30 per cent in gold.

MONTANA.

LIQUIDATOR.—*Inter-Mountain*, Oct. 20: The Liquidator, after a long season of idleness, is now a regular producer of 100 tons daily of first, second and third class ore. Since July 1st $36,000 has been realized from the sale of crude ore on the dump—shipped to Swansea under contract. The amount previously realized from the sale of first-class ore only was $8,000. Under the new schedule of freight rates, 26 per cent ore, which a year ago would not pay to ship, pays a profit above all costs.

COLUSA.—*Inter-Mountain*, Oct. 18: The Colusa is now 400 ft deep. Several thousand feet of levels have been run. The ore product is 100 tons daily, and could be doubled by increasing the working force. Five matting furnaces and one blast furnace are in operation. The company is shipping 20 tons of matte and a large amount of crude ore every day, the total daily shipments being about 75 tons.

MOUNTAIN VIEW.—This is near the apex of the hill northeast of the Anaconda, and in the opinion of Mr. Larabie, it is crossed by what is incontestably the Anaeonda ledge. Throughout the enormous width of the ledge bunches and streaks of copper ore occur, as they did above the main copper deposits in the St. Lawrence and Anaeonda, leaving little doubt that at an increased depth the entire space between the walls will be filled with pay ore identical with that of the above.

SHONBAR.—Butte *Miner*, Oct. 17: The new machinery, boilers, and station pumps are now in running order. On the 300-foot level a large body of the rich ores found above has been struck. The same level is in about 30 ft easterly. The mine is looking better than ever before. There is a body of ore on the west, from the shaft to the west line of the claim, 220 ft, that has not been mined out.

WILLOW CREEK.—Cor. of Butte *Miner*: The new camp on Willow Creek, near Philippsburg, which is being opened up, is 12 miles from New Chicago, and the same distance from Clear Creek. These veins lie almost flat. The veins average 4 ft in width and sample 70 ounces in silver and $8 to $12 in gold. The Screamer lode is showing pay for a distance of 4,800 ft in length, the Copper Queen and Colusa showing pay the entire length of the locations, and the Yellow Jacket and Clear Grit the same. In several other locations there is 18 inches of ore that will sample 200 ounces, and the owners intend shipping this high-grade ore to Butte.

NEW MEXICO.

BLACK HAWK.—Silver City *Enterprise*, Oct. 19: Last Monday an immense and rich body of ore was opened at the bottom of the incline of the Black Hawk mine, at a depth of 250 ft. The ore is completely covered with the shining native silver and argentite. At a depth of 215 ft levels were run from this incline, and rich ore has been struck in them. It appears that the deeper they get the larger the pockets.

GOLDEN RULE.—The mill continues to run steadily, crushing from 50 to 60 tons per day. The mine is looking well. Ore maintains its usual grade. A station is being cut out for second level. Four to five tons of concentrations from the mill tailings are made every day. Over 60 men are employed at the mill and mine.

GRAPHIC.—In the Graphic mine, owned by Hudson and others, in Cook's Peak district, a rich body of high-grade ore was uncovered recently. The owners of claims in the neighborhood are jubilant. The assays give returns of about 200 ounces.

PEAK.—The Peak mine is being worked by C. Bennett and W. H. Kimball, and ore of a very high grade is being struck at every opening.

KINGSTON.—Deming *Tribune*, Oct. 18: The Kingston mines continue to improve. The Bullion yielded $20,000 last month from four car-loads of ore, and the shipments this month are of a yet higher grade. The Superior is also taking out very rich ore, and shipping steadily. The brick has been ordered for a smelter by the Iron King Co. The Lady Franklin is in rich ore; the Brush Heap continues to yield finely; the Little Jimmy has high-grade ore near the contact recently struck; and a new strike is also reported in the Illinois.

SLATE CREEK.—A strike was made on Slate Creek, 3 miles southwest of Telegraph district, in the Ednor mine, owned by Judge Corbin and Robert Swain, recently. Mr. Swain, upon presenting his partner with some of the ore, never dreamed that it contained wire silver in quantity, but upon being examined closely it was found to be marvelously rich. The claim is one of a group in the Carroll district.

OREGON.

NOTES.—Jacksonville *Times*, Oct. 19: Simmons & Co. are making good headway with their new enterprise in the vicinity of Waldo, and have quite a force engaged in opening a huge cut. Wimer & Sons, of Waldo, who are enlarging their ditch and renovating flumes preparatory to putting in another pipe, will soon resume operations. Klippel & Keaton are getting their claim ready for winter.

NUGGET.—Baker City *Democrat*, Oct. 17: On Saturday, while N. C. Haskell, of Auburn, was piping in the Marysville Co.'s mine in Ohio Gulch, near Auburn, he picked up a gold quartz specimen weighing 11¼ ounces, valued at $160. It is a beauty.

UTAH.

LULU.—Southern Utah *Times*, Oct. 20: It is stated, on good authority, that work upon the Lulu, the first south extension of the Horn Silver mine, will be resumed in a few days, and developments prosecuted on a businesslike basis. The is no reason in the world for lacking faith in the possibility of the Lulu folks striking the Horn Silver ledge, if they go down deep enough.

SILVER BELL.—*Tribune*, Oct. 18: This property, consisting of seven patented claims, has been developed by a shaft 385 ft deep, and a tunnel 1300 ft. The shaft was sunk from a point high up the mountain, and went through good ore all the way down, but to operate the mine from that point would be diffiault, because of the cost of hoisting to thes urface and then taking the ore down a steep hill. To obviate this and at the same time open up the other six claims, a tunnel has been run in a distance of 1300 ft, and a contract was let Saturday to extend this tunnel 1200 ft more, when it will be the largest tunnel in Utah. Up to this date there has been $80,000 expended on the property. At the foot of the shaft the vein is 55 ft wide, 6 ft of which is milling ore, running 54 ounces silver. There is on the dump over 3,000 tons of such ore, and the property promises to be one of the big bonanzas of Utah.

WASHINGTON.

THE NEW MINES.—Virginia *Enterprise*, Oct. 23: A letter from Heron Siding, 150 miles west of Missoula, to the *Missoulian*, contains the following: It is signed by D. M. Leamer. "There has been considerable excitement raised here in the past few days by the fact becoming known that the newly found gold fields of Cœur d'Alene were only 20 miles from here. Three men came in from Eagle City (the name of the new camp), making the trip in one day and a half, after wandering through the woods with but a confused idea of the route, getting lost several times, and having to retrace their course in consequence. They came out for supplies, and had the dust to buy it with; which, by the way, was the coarsest dust I ever saw. They report that there are in the neighborhood of 1,000 men there now. A pack trail will be cut at once. Contractors have agreed to do it in 20 days. Heretofore prospectors have been subjected to the hardship of having to go into the mines via Rathdrum, packing their supplies about 90 miles, having to cross the Cœur d'Alene, which can only be done after the 1st of August of each year, and at no time with any degree of safety."

The Distant Sierra.

[Written for the PRESS by J. W. A. WRIGHT.]

No quality of the air of California, and of the Pacific Coast generally, is more marked than its transparent clearness, especially during the greater part of winter and spring. In this regard our Pacific atmosphere quite equals the noted Italian skies. One result of this peculiar transparency is a wonderfully distinct view, at times, of our most distant mountain ranges, and the clear-cut outlines of the foothills. The distant view of the grand cone of Mt. Shasta, from many points in the Sacramento Valley, is a noted illustration of this fact. But it is neither boasting nor exaggeration to say that there is no part of California where so distinct and extended a view can be obtained, on our clearest days, of the snowy peaks, ridges and crests of

Our Higher Sierra,

As throughout Fresno and Tulare counties, particularly along the line of the railway, from Madera on the north to Tipton on the south. From the whole Mussel Slough district this entire view is peculiarly fine, for three reasons: 1. The regions around Hanford, Lemoore and Grangeville are a little south of west, or directly opposite the highest masses of the Sierra Nevada—the Mt. Whitney and Mt. Kaweah groups; 2. These grand mountain masses rise much more abruptly—from the Tulare and Fresno plains, and are nearer to them—than in any other part of California; 3. Mussel Slough, like Wild-flower, in Fresno County, lies so far west upon our broad plains that more of the snow-covered crests and peaks become visible than to an observer stationed nearer the foothills.

In the original sketch of the distant outlines of the Sierra herewith presented to readers of the PRESS, the artist has selected Hanford as a central point, noted for the superb view it offers of the snowy Sierras under a brilliant winter sky, when, so clear-cut are their contours, mountain masses and peaks from 60 to 80 miles distant in a straight line really appears not more than 10 or 15 miles from us. The view is from nature, and is true to nature. It is a wood-cut, from a pencil sketch by C. P. Cook, artist for W. W. Elliott & Co.* For vantage-ground, the sketch was made from the tower of the water-works, at a height of 40 feet from the surface, looking eastward. In the foreground it represents, faithfully, the tops of buildings and trees in Hanford, the level plains beyond dotted with ranches; then the dark-colored foothills; and, crowning the background of the broad and enchanting scene, comes the continuous line of the snow-capped ridges and towering peaks of the highest Sierra of California.

View from Hanford.

For convenience in representing so long an outline as 120 miles of our truly magnificent mountain range, the sketch is divided into three parts. No. 1, above, begins on the left, at a point nearly north of Hanford, and No. 3, below, ends on the right at a point a little south of east from Hanford. A close study of this very grand and impressive scenery of nature for several years, among its splendid peaks, and as seen from our broad plains, aided by every possible source of information, including conferences with such mountaineers as Mr. Frank Dusy, Prof. Gustav Eisen, and Judge W. B. Wallace, has enabled the writer to fix with certainty most of the localities and peaks named with the engraving.

Looking slightly north of east from Hanford or vicinity, any clear winter day, one sees, through a deep notch or gorge in the foothills, two huge white cone-shaped mountain masses. The larger and higher one is to the left, and is undoubtedly

Mount Lyell,

Named after Sir Charles Lyell, the eminent English geologist. That to the right is Mt. Ritter, named in honor of the noted German geographer Carl Ritter. The depression through which they are seen is the canyon through which the San Joaquin enters our plains near Millerton. Mt. Lyell is interesting as a landmark, for there the county lines of Fresno, Merced and Mono meet. It is interesting as a river-source, the main San Joaquin and its north fork having their extreme sources on its eastern and southern slopes, while the Merced rises on its northern and western sides. It is interesting for its living glaciers, discovered there by John Muir at least ten years ago. And, by the way, the living glaciers announced as discovered recently by an explorer west of Mono Lake, are most likely those well known glaciers of Mt. Lyell, for these are just west of Mono Lake. The white peaks and ridges, some ten miles west or to the left of Mt. Lyell, are the elevations around Yosemite Valley. Mt. Lyell is 13,327 feet high, and is about 95 miles in a direct line from Hanford.

The eye, following the long, white crest to the southward, and passing over a number of minor peaks, comes to a high, sharp, regular cone, very conspicuous in its locality. This is

Mount Goddard,

Named after a civil engineer and mountain surveyor. From its northeastern slopes the south fork of the San Joaquin takes its rise, and on its south side numerous lakes form the sources of the middle fork of King's River. This handsome peak is No. 4 in the sketch. Its height is fully 14,000 feet.

Next, the letter "A" marks the location of Paradise Valley, or the canyon of the south fork of King's River, described by our mountain explorers as a "second Yosemite." No. 5 marks a handsome "saw-tooth," named after Prof. Silliman. It is 11,625 feet high, and is on the great western divide of the Sierra Nevada. Between this and a long, flat, table mountain, three high peaks are seen. These are the only ones marked in the engraving of which identification from our plains is at all uncertain. But that to the left, or north, is most likely Mt. Brewer, 13,886 feet high; the second, Mt. Williamson, about 14,400 feet; and Mt. Tyndal, 14,386 feet. These are numbered 6, 7, and 8. They were named after distinguished scientists, by Prof. Whitney's geological survey party, in 1864. The long, flat mountain immediately south of these is called on some of our older maps Table Mountain; but as there is a Table Mountain in Tuolumne County, and another near Millerton, a more distinguishing name for this mountain was needed. Hence, it was named Mt. Hazen, in honor of General Hazen, Chief Signal Officer, by Capt. Michaelis, the United States officer in command of the Signal Service and scientific expedition to Mt. Whitney, in August and September, 1881.

The second peak southward from Mt. Hazen is Milestone Mountain, long known in this valley by the tall granite obelisk surmounting it. It is also called "The Old Man." On a very clear day this obelisk can be distinguished by the naked eye, but it is more readily seen with a good glass. Immediately to the right and left of Milestone Mountain, and about equidistant from it, are two prominent peaks. The one north was named, in 1881, Mt. Michaelis; the one south, Mt. Langley, after the commander and scientist of the expedition above named. These names, with a number of others, were given from the summit of Mt. Whitney, on the morning of September 6th, 1881, when the writer, with his friends, Judge W. B. Wallace of Visalia, and Rev. F. H. Wales of Tulare City, enjoyed the treat of being in that grand region with the government expedition, whose work was then described in the PRESS and other journals.

No. 10 is Mt. Michaelis, and No. 12 Mt. Langley. We have now reached that part of our vast mountain range which presents in winter far the grandest view to be had from our plains of any portion of the Sierra Nevada. The artist has so well represented this part of the view that it will be readily recognized by any who have seen it. Through a deep depression in the foothills this most Arctic-looking region of the Sierras shows most conspicuously; the great mountain masses, their ridges, cañons, seams, crests, and sharp-cut peaks, covered with virgin snow, and glittering in the sunshine.

THE SIERRAS AS SEEN FROM HANFORD, TULARE COUNTY; 120 MILES IN THREE SECTIONS.

1. Yosemite. 2. Mt. Lyell. 3. Mt. Ritter. 4. Mt. Goddard. 5. Mt. Silliman. 6. Mt. Brewer. 7. Mt. Tyndall. 8. Mt. Williamson. 9. Mt. Hazen. 10. Mt. Michaelis. 11. Milestone Mountain. 12. Mt. Langley. 13. Location of Mt. Whitney. 14. Mt. Abert. 15. Mt. Henry. 16. Mt. Le Conte. 17. Mt. Kaweah. 18. Empire Mountain. 19. Miners' Peak. 20. Mt. Garfield. 21. Bullion Peak. A. Location of Paradise Valley. B. Location of Kern Canyon.

The better to understand this portion of the Sierra Nevada, we must remember that from King's River Canyon, southward, for 60 miles or more, there are two great divides, or back-bones,—the western, on which are Mts. Silliman, Hazen, Milestone, and all from No. 14 to 21; and the eastern, on which are Mts. Kearsarge, at Kearsarge Pass, near Independence (not marked here), Mts. Tyndall, Williamson and Whitney. The latter divide is from 10 to 12 miles east of the former, and is the grand and precipitous western wall of Owen's River valley. From the neighborhood of Mt. Hazen is a lofty transverse wall running nearly due east to Mt. Williamson. This wall is the almost impassable divide between the headwaters of the south and middle forks of King's River, north of it, and the Kern and its tributaries south of it.

Mount Whitney,

The highest and grandest of some half dozen comparatively isolated peaks, lies fully eight miles south of this dividing ridge, between King's and Kern rivers, and the only river that is fed by its melting snows, from its northern, western, or southern sides, is the Kern, merely a few insignificant streams flowing from its eastern face into Owen's River. Its position is marked, as nearly as can be, in the engraving, at No. 13. It so happens that the highest peaks in the western divide (the Kaweah Buttes) come directly between us and the Mt. Whitney group, so that Mt. Whitney is perhaps not visible from any part of Tulare County, unless it be from its most westerly portions, where we may, so to speak, overlook the high peaks intervening. It is true, however, that from Fresno City and vicinity a distant group of peaks in the great eastern divide is readily seen with a good glass, especially from the Court-house dome, one of which has the noted helmet-shape of Mt. Whitney, and other marks, that make it quite certain that we can see Mt. Whitney from there, looking through the deep gorge of King's River. It assuredly has much the same appearance that Mt. Whitney presented to our party of three in the summer of 1881, after we became familiar with it, and saw it and its attendant peaks, Mts. Young, Hitchcock, Guyot, and Agassiz, day after day, as we moved with our pack animals northwest and west across the huge table-lands and ridges of the Kern and Kaweah rivers. It is also a fact worthy of record here, that, looking westward from the towering summit of Mt. Whitney, all the peaks and crests from Mt. Brewer (No. 6) to Bullion Peak (No. 21) presented very much the same outline against the western horizon as does this magnificent mountain profile present in reverse on the eastern horizon, when we look eastward from the plains of Tulare County. It is for this reason that we can so readily identify the several peaks named in 1881 and previously, as they appear in the original engraving herewith presented—the first attempt of the kind to represent with any accuracy an extended profile of our truly grand Sierra Nevada. We next come to

The Kaweah Buttes,

A peculiarly isolated, distinct group of peaks—the culminating peaks of the great western divide already mentioned. These were first explored, and their locality and surroundings accurately fixed by our party of three, in '81. Some half dozen of these sharp, high, precipitous peaks, evidently from a later and more direct volcanic action than the Whitney group, rise abruptly to altitudes 4,000 feet and more, from the extensive pine-clad table-land between Kern Canyon, on the main Kern, and Jenny Lind Canyon, through which flows Crahtree Creek, one of the chief tributaries of the Kern. Mt. Kaweah, No. 17, was the only one of these fine peaks named before our party visited them. This we ascended September 16th, and built a monument on its summit, which we found to be at least 14,000 feet above sea level. Just as Mt. Whitney had been first named by Clarence King, from the summit of Mt. Brewer, on the Fourth of July, 1864, so we by common agreement named the three high peaks in the group just northwest of Mt. Kaweah, from north to south, Mts. Abert, Henry, and Le Conte. The first, from Col. John J. Abert, who for thirty years or more was chief of the Topographical Engineers, U. S. A., and who fitted out the Fremont expedition, that first opened up California to American enterprise; the second, for Prof. Joseph Henry, who was so long the honored Secretary of the Smithsonian Institute at Washington; the third, or Prof. Joseph Le Conte, of our State University, who has done so much for the geology of California. These are numbered 14, 15 and 16, in the engraving, and are each 14,000 feet in height or upwards.

These magnificent peaks form the most conspicuous landmarks of our Sierra Nevada, as seen from the plains of Tulare and Fresno counties.

Next come 18, 19 and 20—Empire Mountain, Miners' Peak, and

Mount Garfield.

These belong to the Mineral King District, which was for some years the chief mining district of Tulare County, and is situated about eighty miles, by road, slightly north of east, from Hanford. Its wide metal-bearing ledges abound in silver, combined with lead, zinc, copper, and antimony.

The noted Empire mine of Hon. Thomas Fowler is in the western face of this Empire Mountain, the mouth of its great cave and tunnel being about 10,000 feet above the sea. At the base of this mountain the little mining town of Mineral King nestles cosily, at an altitude of nearly 8,000 feet. Nineteen and twenty appear as two great saw-teeth. The one to the left is Miners' Peak, also called by the miners "Half-Potato Hill." That to the right is Mt. Garfield, named under the following circumstances: September 21, 1881, the day after our party returned from exploring the upper Kern, Mr. Wales, Joseph Palmer, Mr. Lavelle, and others of us, made the ascent of Miners' Peak, which lies about four miles east of the town of Mineral King. While on its summit, we learned, by careful leveling, that the fine unnamed peak some four miles southeast of us was several hundred feet higher than Miners' Peak, which till then had been sup-

(CONCLUDED ON PAGE 292.)

* The engraving used herewith is from the publication entitled "Guide to the Scenery about Mt. Whitney," by W. W. Elliott & Co., 421 Montgomery St., S. F.

THE ENGINEER.

Shipbuilding Now and Then.

Shipbuilding in some of its chief characteristics is a very different art from what it was only a few years ago. The substitution, first, of iron for wood, and, secondarily, of steel for both wood and iron, will soon have effected an entire revolution. Canada, next after Maine, was the stronghold of wooden shipbuilding, but a feeling bordering on consternation has been caused in the Dominion by the announcement that a firm who for many years have been among the largest owners of sailing ships in America, building most of their vessels in St. John and vicinity, have just closed a contract in England for a sailing ship of 1,500 tons, to be built of iron. Wooden shipbuilding in Canada for several years has been a declining industry, and this last movement is regarded as a presage of its well nigh final extinction. The so-called "soft-wood" ships of the Canadian Provinces were the cheapest that could be built, it being possible to put afloat in New Brunswick or Nova Scotia a vessel of this description fully equal in appearance to one built in Maine, and at a cost several dollars less per ton. If, under such favoring conditions, wood can not compete with iron or steel, Canada has but one alternative, if she would maintain her shipyards, of seeking materials among the products of the mine rather than of the forest. In this new departure builders in the United States have already got the start, and by a long distance. On the Delaware River, convenient to the iron and coal mines of Pennsylvania, no less than 56 vessels have been constructed during the present year, five of them wholly of steel, and the indications are still more promising for the year 1884. It is claimed that the progress made in the Delaware yards since January 1st, is equal to theentire business done in the same establishments in the whole of 1882.—*The Iron Age.*

To be Pushed in Earnest.

If the latest news reported from the Isthmus of Panama may be relied upon, there would appear to be good grounds for anticipating the finishing of the ship canal that shall unite the two oceans at some reasonably early date. Hitherto, from all that could be learned from that region, very little real work had been done, and the opinion was gaining ground that the obstacles interposed by nature in the deadly climate, in addition to the engineering difficulties to be overcome, had proved so great that the projectors of the canal were simply going through the motions of keeping at work, waiting, meantime, for the first good opportunity to give it up without incurring too serious a loss of prestige.

From present indications, however, the projectors of the canal have no idea of abandoning the work. Ten thousand workmen are said to be distributed over nine sections of the route, covering thirty miles of distance. These workmen are composed principally of native Jamaicans, who, being thoroughly acclimated, may be expected to do some effective work in pushing the canal to completion. From whatever aspect this important enterprise is viewed, the enormous benefits that will accrue to the commerce of the entire civilized world from its completion must be admitted; and no one intelligent enough to comprehend this fact will wish the present undertaking any thing else than ultimate and speedy success.

DEEP-SEA LIGHT-HOUSES.—An English journal gives an account of a plan recently proposed by an English engineer for founding "deep-sea light-houses." As explained to the London Society of Engineers, this plan proposes the construction of a hollow cylinder of riveted iron-work 290 feet long, to consist of two sections, the upper part to be 140 feet long, destined to rear its head above the waves, and fitted as an ordinary light-house, while the remaining portion of the tube is to be ballasted so as to sink below the water-line and counteract the force of wind and waves on the exposed part. The whole apparatus is to be anchored in deep water, by heavy steel cables. The inventor claims that it would be easy to tow such a structure to the spot selected for it; and then, by admitting water to the lower section, it would assume an upright position and ride the waves like a bottle. The practical use which this is intended to serve is to give notice of approaching storms by means of telegraphic connection with the shore. It is believed to be practical to found a floating telegraph station, say 1,000 miles from the coast of England, in mid-ocean, from which comings of approaching storms could be given long before their arrival.

THE PENNSYLVANIA RAILROAD is now building a gigantic inclined plane at Pittsburg, up which teams and freight and passenger cars will be hauled by means of steel cables. The plane has a total length of 840 feet, the rise being nearly 43 feet in the hundred. It is built on arches. The longest span is 232 feet, another one is 120 feet, and the rest 60 feet each. The cables to be used in hauling up cars are entirely of steel, and will be the largest steel cables ever made in this country. The engines which will furnish the motive power are nearly completed, and will be of 700 indicated horse-power. The total cost of the gigantic structure, complete, will be $275,000.

USEFUL INFORMATION.

Chicago Beer.

The *Northwestern Lumberman* claims that until lately beer has never been supposed to have any very intimate connection with the lumber business, except it adds as an internal fuel to fire the ardor of a lot of dock-wallopers, or to induce a lot of men to hustle up a drive. Now it is asserted that beer is made of which hemlock bark is a principal ingredient, though it never has had much of a reputation beyond the modesty of a plain tea. The cargo arrivals of hemlock bark at Chicago are numerous, and it is stated by persons who claim to understand the ropes, that the tanneries are not the only importunate consumers, but that the bark is extensively ground and sold to makers of beer at outside points.

It is used as an adulteration for beer. Large quantities of it are ground up and shipped to other points. Brewers do not report the ingredients of which their beer is made, as they once did. The courts have decided that they are not compelled to do so. Tanbark and soda are the principal substances used. A little rice malt gives it body and makes it hold foam. Hemlock bark is a new discovery in this respect, and is useful because it takes the place, to a certain extent, of both malt and hops. It is not poisonous, but it certainly can not be said to contain any nourishment. It adds the pungent, bitter taste, and gives the dark-reddish color to the liquid. It is very cheap, and the brewers who use it must grow rich very fast.

ORANGE AND LEMON BOXES.—It is generally supposed, says the New York *Maritime Register*, that the boxes in which oranges and lemons are sent to this country from the Mediterranean are made along the shores of that sea. This was the case years ago, but it is so no longer. Formerly the shooks were hewed out of the log by hand in Italy, and sent down to the packers. But a few years ago Capt. T. J. Stewart, a native of Maine, a shipmaster who had traded with the Italian ports, came to the conclusion that these shooks could be made much cheaper in his native state, and shipped thence to the fruit districts at a profit. With him to think was to act. He accordingly retired from the sea and proceeded to Bangor, Maine, where he put his new idea into practice. It has proved highly successful, and now orange and lemon boxes are exported thence to many of our fruit-shipping ports; also to all the great ports of the Mediterranean fruit districts. The trade has grown to important proportions, and it is said that few oranges and lemons arrive in this country that are not in boxes of Maine make.

WHAT IS ROSEWOOD?—It has been a mystery to some people why the dark wood so highly prized for furniture should be called "rose-wood." Its color certainly does not look much like a rose, so we must look for some other reason. An exchange explains that when the tree is first cut the fresh wood possesses a very strong, rose-like fragrance, hence the name. There are a half dozen or more kinds of rose-wood trees. The varieties are found in South America and in the East Indies and neighboring islands. Sometimes the trees grow so large that planks four feet broad and ten feet in length can be cut from them. These broad planks are principally used to make the tops of piano-fortes. When growing in the forest the tree is remarkable for its beauty, but such is its value in manufacturing as an ornamental wood, that some of the forests where it once grew abundantly now have scarcely a single specimen.

LARGE FLOUR PACKAGES.—The practice in England is to send out flour in packages containing 285 lbs. These packages are very difficult to handle. Recently, a man attempting to carry one of these bags fell under the excessive weight, and broke his back. It is contended by the men that in addition to their safety being endangered in this way, they are rendered prematurely old by the constant carrying of such heavy weight. It was decided to request the mill owners in future to make the bag two centals or two hundred pounds, and the first important movement in England towards uniformity in flour packages was begun in Exeter, September 22d, when a meeting of flour millers of that place and vicinity was held to act in the matter.

STEAM WHISTLES.—To appease the great outcry which is now being raised against the steam whistle nuisance, the *Railroad Gazette* suggests the substitution of a steam horn. That journal says, that as a general rule the steam whistle would be very powerful to be effective within half a mile. If a horn were used the gain in useful effect would be very great, while the disagreeableness of the tone would be almost entirely done away with. The form of such an instrument might be very simple and much less expensive than the whistle. The tone would be mellowing—much like the sound of the modern tuba or cornet. There seems to be here a good opportunity for some ingenious person to exercise his inventive talents.

A SEA GRASS FOR BREAD.—On the west coast of England grows a sort of sea grass (*porphyra laciniata*) which is made into something very like bread. In the main it is gathered by women; they then wash it and pluck all other plants carefully from it. After this it is boiled for some two hours; then the mass is cut in pieces with knives and kneaded into loaves. Oat meal is then strewed over it to give it greater cohesion and a more inviting appearance, and then it is baked. It keeps in summer for four days, and in winter for eight. Many women on the coast of Devonshire earn their living by selling this bread, and most of it is sent to Swansea (in Wales), where it is much liked by the poorer classes.

THE MIXING OF WHEATS of various sorts for the purpose of producing different brands of flour has attained great perfection in England, and has caused the peculiarities of the different wheats to be closely studied. As to the wheats of the Russian provinces, although they are certainly quite strong, yet unmixed with other wheats they are too weak for really good flour. The Konigsberg, Odessa, and Black Sea flours have a decided tinge of color, but are less strong than the others. There are no wheats from any portion of the world as good for mixing as the best California varieties.

THE FUTURE OF TEXAS.—General McClellan, who has recently visited many parts of the Texas Panhandle, predicts that by the year 1890 the state will have a population of 5,000,000, while he also affirms that it can support 20,000,000 without overcrowding. The capabilities of Texas are only just being discovered: it is larger than France, with a better soil and an equal climate, is well watered, and is being completely intersected by railroads.

CARRIER RAVENS.—Successful experiments have lately been made at Coblentz in the training of ravens as carrier birds in place of pigeons. The latter are more subject to the attack of birds of prey than ravens. The trained ravens were made to fly a distance of forty miles, and their performances gave much satisfaction.

GIANTS IN PATAGONIA.—A party of Italian scientists have just returned from an expedition to the South Pacific, having proved to their own satisfaction that a race of giants once existed in Patagonia. In wandering over Terra del Fuego, they found human bones of marvelously large size.

CYPRESS VS. WHITE PINE.—A gentleman who has charge of an extensive sash, door and blind factory at Vicksburg, Miss., says that for these articles cypress is superior to the best white pine.

GOOD HEALTH.

A Chapter on Health Foods.

The day is cold, and dark, and dreary indeed, when one does not find in an exchange a fresh theory upon the proper kind of food for human consumption, together with authoritative directions for proper preparation. The amount of unadulterated ignorance and superlative gall displayed by some of these writers would be more startling to the careful reader were he competent to pronounce judgment with certainty, but the fact is that the world moves so slowly in the matters of cookery and medicine, that there is to-day no one authority on either whose words are believed by a very large constituency.

One crank will tell you that bread made from white flour is like so much lead in the stomach, and should be discarded entirely, the coarse meals, rye, corn, and oat, being used in place of it. Another will enlarge on the value of mush, gruel, and porridge, from oatmeal, rye, or corn meal, and will prove to his own satisfaction that mush is the only fit food, in connection with fresh fruit, for the human stomach. Then comes the oracle who says that mush is not even fit for animals, and is poison to the human race. He tells you to eat fermented bread only after it has been baked two days, and says that rye and oat meal stirred up in water and baked in thin layers, make the only bread fit for eating. He tells you that meat is very bad for you, particularly in summer, but if you will eat it, confine yourself to certain kinds cooked in a certain way.

The soft-brained vegetarian hops into the ring with his war cry of "down with meat food," and tells you that rice, sago, tapioca, vegetables and fruit are the proper foods, and the only ones that insure perfect health and long life. To him all flesh is poison—fish, fowl or beast. Like his predecessors, he has winter and summer diets, and rules for cooking. The meat man comes along with his forcible demonstrations that meat and wheat bread in winter, and fish in summer, with a select list of vegetables, constitute the only truly healthful list of regular tri-daily visitants to the stomachs of the people.

There are various side issues, such as milk foods, causes of nervousness, rare or burned meats, boiling, baking, frying, broiling, steaming, etc., which enter into all these arguments to some extent, and the careful student of these often well woven and always wonderfully formed theories of diet is at last driven to the desperate course adopted by the man who believed every thing he read, and cut off, one by one, each separate article of food and drink, until he reached a point where water and dried pea flour were the only things he consumed. He read an analysis of water, which proved it to be full of disease germs and poisonous animalcules, and learned from another source that pease contained so much starch that any preparation thereof consumed for a certain time would turn the stomach into a mere laundry attachment. This capped the climax, and the weary seeker after a healthful diet burned the scrap book which he had filled with dietetic theories, and lived thereafter upon every thing which pleased his palate, regardless of the consequences.

While it is true that some people thrive upon food that would sicken others, and quite as true that certain breads are unwholesome, certain meats harmful, and certain modes of cookery sure to render the food indigestible, the sensible portion of the world's inhabitants have come to the conclusion that the correct way to feed is with such foods as are most desired by the individual. All feel, at times, the desire for a change of diet, and there are few who can not secure this at will. Certain very palatable dishes are undoubtedly very unwholesome, but there is no master so arbitrary and imperious as the human stomach; and so long as there is a world with people in it this must remain a fixed fact, so that until the millenium arrives people will eat what they please, as they please, food theorists and dietetic cranks to the contrary, notwithstanding.—*Exchange.*

UNNECESSARY NOISES are attracting the attention of medical men and journals. The *Medical News* says: "To sick and convalescent, and to 'nervous people,'—a class rapidly increasing in number with the progress of our civilization—street noise is an intolerable nuisance, which, in some cases, may result in positive injury, and is a penalty paid for living in the city. Many of these noises are, in a degree, the necessary concomitants of traffic and manufacture, and therefore the result of useful occupation; others are inheritances from the bygone, and have long since survived the period of their utility. Of the latter we may mention, as conspicuous examples, the church bell and the factory whistle, both of which have been entirely superseded in their useful purpose ever since the introduction of watches into general use. The unnecessary noises—and they are legion—should go.

GLUTEN.—Through chemical research it has become established that pure gluten is not digestible in the human economy, and that it attains its greatest nourishing properties when mixed with other nutritive substances. It becomes most easily digestible when mixed with albuminous portions of vegetables. The substance which is obtained by washing the dough of wheat flour is, in fact, such a mixture as, being dissolved in alcohol, can be separated into its several elements, while at the same time the gluten contained therein is not dissolved. Pure gluten is perfectly yellow, tastes like balsam, and has a peculiar odor. It is very tenacious and elastic, and is not soluble in cold water. It contains from fourteen to sixteen per cent of nitrogen. Nothing among vegetable substances, except albumen, contains it in so large a quantity.—*Allgemeine Muehler.*

HYGIENE OF MOUNTAIN CLIMBING.—Dr. Brenner advocates exercise in the high, fine air of mountains as the best protection against the diseases contracted in city life. The characteristics of the mountain climate are the low temperature and air pressure; the low relative humidity; the high per cent of ozone; the strong light and insolation; the freedom from dust and bacteria. All these act well on the bodily health. The lungs work with greater strength, the heart beats faster, the blood circulates more quickly, appetite is increased, perspiration becomes freer, the muscles become more energetic, and the whole body gains in strength and endurance.

TEMPERATURE OF A BATH.—The temperature for a bath is the one which feels agreeable and comfortable, and not the one that feels hot or cold. Of course these may be necessary in certain cases. As a rule a bath may last as long as it is agreeable. This may be one minute, five minutes, or longer. Those who have accustomed themselves to hot baths may lower the temperature gradually and soon accustom themselves to a cold or cool bath.—*Herald of Health.*

CONSUMPTION OF QUININE.—Quinine is said to be decreasing in demand at the West, a prominent Chicago firm reporting that weekly sales are a fifth of those a few years ago; a circumstance due to the disappearance of malaria as farms are drained and land cultivated. Malaria is certainly increasing in New England. *Boston Traveler.*

CONSUMPTION AN INFECTIOUS DISEASE.—The Wisconsin State Medical Society, during its recent annual session, passed a resolution virtually declaring consumption to be an infectious disease, and urging the necessity of the proper isolation and disinfection of those suffering from it.

M. VICTOR SAINT PAUL has placed $5,000 at the disposal of the Paris Academy of Medicine, as a prize to any person, whatever may be his vocation or nationality, who shall succeed in discovering an infallible means of curing diphtheria,

Passing Events.

The proposition to organize a manufacturers' association in this city, to which we refer elsewhere, is something novel for this Coast. A meeting has been held, and arrangements to perfect the organization are being made by a committee.

Very little news of special importance comes from the mines just at present. Work is being vigoriously prosecuted and preparations for winter being made.

Advices from Mexico with respect to the yellow fever show that the disease was by no means confined to the coast alone. The existence of this dread disease in the region referred to will have more or less influence in the prosecution of mining entsrprises. A vessel from the Mexican ports, with three cases of yellow fever aboard, came into this harbor during the week, and is now in quarantine.

THE following are among those receiving prizes at the International Fish Show, at London: The Cutting Packing Company, San Francisco, for general exhibit of prepared fish; the Oregon Packing Company, Portland, Or., for general exhibit of canned fish; J. O. Megler & Co., Brookfield, W. T., for salmon in cans; Alaska Commercial Company, San Francisco, for collection of sealskins.

Look Nearer Home.

It does not follow because there are a number of districts in California and Nevada that are only worked in a small way, or not worked at all, that these regions are worthless, or should not be prospected. It very often happens that a district gets a "black eye" by being overrated at first. Then, again, a few capitalists get disappointed, and give it a bad name, so others will not touch it. A more common reason is, that the ore may be of such a character as to require very expensive machinery to beneficiate it, or be of so low a grade as to pay only moderately. Another thing, too, attention may be attracted from a place by others more promising at the time, and then people do not go back to the first one.

It is a very common experience for men to prefer going a long distance to mine rather than open claims near home. "The hills look green afar off." A well worded description of a mine in Arizona, Mexico, Idaho or Alaska, will seem more tempting to a California or Nevada prospector than the sight of a promising ledge in his own state. Two or three failures in a camp will often injure it beyond recovery, when it may have been more the fault of the men than the mines. In fact, the fault of the men is too often laid to the mines.

There are many places in this state which were abandoned twenty years ago where mines are now being profitably worked, under the changed conditions. No doubt in a few years more there will be many other mining claims now thought of no value that will be worked. Nearly every old miner can tell of claims which would be profitable if properly opened. Development companies, such as we described a few weeks since, will do much to bring forward mines of this kind. For men with experience and means, there are hundreds of places on this Coast where money can be made in mining, without the necessity of going hundreds of miles away from the metropolis.

A Manufacturers' Association.

A preliminary meeting of the manufactnrers of this city was held a few days since to arrange for a permanent organization. Among those who signed the call for the meeting were the following:

Tubbs & Co., of the Potrero Rope-walk; William Harney, Secretary of the Golden Gate Woolen Mills; Hinckley, Spiers & Hayes, of the Fulton Iron Works; the California Wire Works; Kohler & Frohling, wine makers; W. T. Garratt & Co., brass founders; the Pacific Saw Company, the San Francisco Tool Works, Abner Doble, Irving M. Scott, Savage & Son, Arpad Haraszthy, vintner; Whittier, Fuller & Co., S. T. Taylor, paper manufacturer; Buckingham & Hecht, shoe manufacturers; Armes & Dallam, makers of wooden-ware; L & E. Emanuel, furniture manufacturers, and the California Sugar Refinery.

Messrs. Hallidie, Scott, Kerr, Jackson, Garratt, Savage, Haraszthy, Harney, Boesch, Taylor and Kohler were present. A committee on organization was appointed, consisting of Messrs. Hallidie, Whittier, Haraszthy, Harney and Garratt.

The proposed organization is in the interests of home producers and local manufactnrers. Mutual protection of common interests is the object. The committee will report in about two weeks, when more will be made public concerning the organization.

THE STATE MINING BUREAU has been enriched by the donation of an excelleut portrait of Dr. J. B. Trask, the first State Geologist of California. Mr. P. L. Peters, the artist, has presented a finely executed portrait in oil of the late Joseph Wasson, who may be called the founder of the State Mining Bureau, as it was mainly by his efforts that the institution came into existence. Both these pictures are of great historical interest.

IT has been remarked that the interior of the state shows this year a marked progress in development. Large amounts of real estate have changed hands, and a large immigration has taken place. Sacramento feels this new life, and more improvements have been made there during the present season than for years past. Three new blocks are being erected, which will be the most costly in the city.

IT is rumored that King Louis of Portugal, being weary of the liberal agitation in his kingdom, thinks of abdicating.

New Ore Grinder and Amalgamator.

A new form of combined ore grinder and amalgamator has just been patented through the MINING AND SCIENTIFIC PRESS, by Peter Eddy, of Nevada City, Cal., who has assigned an interest in the patent to James G. Hartwell, of the same place. The apparatus is intended principally to render profitable the further reduction of quartz-mill tailings known to contain free gold, but classed as too low a grade to be worked with the ordinary apparatus now in use.

An exterior cylindrical case is supported on suitable framework, and placed with its axis horizontal, the pulp or tailings being fed in through a hopper. A shaft passes through the cylindrical case, and at one end is a cylindrical shell, inside the] other, nearly equal in diameter to the drum. This inner shell is supported on the shaft, and has inwardly-turned flanges. This shell is made in sections, and may have interior plates or dies, made removable. Within this shell is a receiver, of smaller diameter, which serves to receive the material from supply pipes, and from which it is conveyed to the grinding shoe, through a radial plate which extends outwardly from its periphery, and telescopes into a similar pipe, which projects inwardly from the shoe. This shoe is a heavy iron arc of the same curve as the interior of the shell, and it rests on the inside bottom of the inner cylindrical shell. As the receiver turns loosely on the shaft, and as the shell is caused to rotate by the rotation of the shaft to which it is fixed, the shoe slides around loosely within it, on account of the tendency of gravitation to keep it at the bottom. The material is ground beneath the shoe as the shell revolves, while the shoe, as stated, remains comparatively stationary at the lowest point.

After the separated pulp has passed under the shoe and been ground, a further separation will take place. The lighter material is floated over a flange, by the water, while the heavier material is carried by the rotation of the shell upward and around the die, to where it comes in contact with the scraper, which directs it to a quicksilver tank.

Spirals or screw-shaped flanges are supported from the axle or shaft, which have an exterior diameter about equal to that of the shell, and as these are revolved they carry the material over and through the mercury, so that any gold contained therein may be amalgamated and saved. The action of the spiral flange causes a slight wave or movement of the mercury in the direction of the discharge, and to counteract this the end of the spiral flange is formed so as to prevent the mercury passing out.

A series of arms is secured to the shaft, and have buckets fixed on them so as to dip into that portion of the case at the opposite end from the grinding dies in the shell. These buckets discharge into suitable pipes connecting them with the receiver. The heavy sand is thus carried into the receiver, and then under the shoe to be ground; after which it is again carried by the spiral flanges over the mercury trough and into the space where the buckets work.

When the pulp or material first enters the case through the hopper it is stirred up by the spiral flanges and by paddles fixed to them, and an action takes place which allows the heavier valuable portions to settle to the bottom, where they come in contact with the mercury, which is kept in motion, so that any free gold will be amalgamated, while the slimes and light waste are kept in constant agitation and are carried off. A discharge trap allows the mercury to be drawn off when desired.

HOLLOW MAGNETS.—While Preece has found that there is no difference in the conducting power of the lightning rods of various forms, Holtz has concluded that solid steel bars do not form so good permanent magnets as tubes, because the core acts as an armature joining the two poles. In experimenting to test his hypothesis, he magnetized rods and tubes to saturation, and found that the magnetism of the tube showed an excess of more than fifty per cent. After waiting six months he subjected the same magnets to new tests, in order to find which retained the magnetism best. He found that the magnetism of the solid was to that of the hollow magnets, in one case, as 1:2.5, in another, as 1:2.9.—*Wied. Annalen.*

A HUNTER at Cucamongo, San Bernardino, has shot one thousand dozen quail this summer.

Precipitation of Gold.

[Written for the PRESS, by C. H. Aaron.]

In the paper by W. Rothwell on the "Treatment of Auriferous Concentrates" at the Deloro Works, it appears that a difficulty was encountered in the precipitation of the gold in the usual manner by iron sulphates, which led to the use of charcoal for that purpose. Mr. Rothwell mentions that sulphuretted hydrogen has been suggested, and seems rather inclined to favor its use.

In my book on "Leaching Gold and Silver Ores," I have mentioned the use of hydrogen sulphide as a precipitant for gold in solution as terchloride, with the remark that copper, if present, would also be precipitated, which would be an objection to that method; but since the book was written I have found that the difficulty may be easily overcome. At the Plumas National Chlorination Works, in Plumas County, California, I found that the gold was precipitated in a very unsatisfactory manner by iron sulphate. The concentrates contained a large quantity of magnesia, which necessitated the addition of salt in the roasting. The gold, as thrown down by iron sulphate, was a black, slimy mud, difficult to collect, almost impossible to wash, and troublesome to melt.

I then made hydrogen sulphide from iron sulphide prepared from a portion of the concentrates, using the chlorine apparatus as a generator *pro tempore*. The construction of the apparatus did not admit of a pressure of more than 6 inches of water, yet the precipitation was very satisfactory when aided by warming the solution by a jet of steam. The gold was recovered as a sulphide, easily collected and washed. The sulphur was readily expelled by roasting in an open iron pan (over the assay furnace for the time), the metal assumed its proper golden color, and, after washing with dilute sulphuric acid, yielded a bar of very fine gold when melted without nitre in a black-lead pot.

In the course of these operations, something, I do not remember what, suggested the idea that precipitated copper sulphide would throw down gold from the solution. On trial, I found that it did so, the gold being precipitated rapidly in the metallic state, and the copper remaining in solution as sulpbate. This was better than I had expected; I had supposed that the gold would combine with the sulphur, leaving the copper dissolved as chloride. It appears, however, that the gold terchloride causes oxidation of both the copper and the sulpbur, and it will be readily seen that gold in the presence of a copper salt may be precipitated in metallic state, and but little contaminated by copper sulphide, by means of hydrogen sulphide, and may be further purified by washing in a bath of fresh solution of gold. Following up this idea, I propose to pass the gold solution through a series of vessels containing precipitated copper sulphide, which, in the first vessel, would soon be replaced by pure gold. The first vessel would then be removed, and that which was the second would take its place, while the first, after removal of the gold and recharging with copper sulphide, would be made the last of the series.

The copper passing off in the solution would be recovered by precipitation with hydrogen sulpbide, or an alkaline mono-sulphide, the poly-sulphides being objectionable on account of making a precipitate contaminated by free sulphur, though that could be removed with reproductiou of a certain proportion of the poly-sulpbide, by boiling with caustic potasb, etc.

An attempt to patent this process was defeated by a reference to a remarkably voluminous and comprehensive English patent by which it was forestalled as to its principal feature. I, however, commend it to the consideration of the Deloro Company and others.

[Since the above was received from the author he has sent us the following paragraph, which we now add to the original article.—EDS. PRESS:]

In my communication on this subject, suggesting the use of copper sulphide, I overlooked the fact that in the case of the Deloro Company the formation of sulpburic acid would be objectionable, in the same way as iron sulphate. If their leach contains copper, it seems possible that hydrogen sulphide might cause the same trouble. Sulpburous acid, which is a good precipitant and would cost nothing at the works, may be open to a similar objection in the presence of calcium chloride in the leach. Would it be impertinent to suggest that iron protochloride could be easily made, and will throw down the gold without precipitating the lime? Manganese protochloride also answers. Copper dichloride is a good precipitant, and could be recovered by means of sulphurous acid, though gypsum would also be thrown down; yet the dichloride could be separated by means of warm brine, and used in the state of solution. The addition of a little iron protochloride would prevent the formation of an oxychloride.

Blasting in Mines—No. 13.

Having devoted our attention thus far in this series of articles to systems of blasting, it is proper now to consider the explosives used and the proper way of handling them. High grade explosives are so largely in use now as to be familiar to most miners. The most prominently known of these is

Giant Powder,

Or dynamite, which are the same, giant being the American and dynamite the European name. The Giant Powder Company acquired their patents from the European inventor, Alfred Nobel. This company introduced the dynamite, under the name of giant powder, into the United States. The giant powder, or dynamite, has been improved from time to time. The value of nitro-glycerine powder is regulated by the amount of nitro-glycerine in it, and by a careful manipulation of the ingredients which absorb the oil.

It is not our purpose to take up the question of relative merit of the various explosives or go into the powder question at all, beyond giving such instructions for handling the powder as the companies recommend, and as experience has taught. In doing this it will be necessary to say much that many miners already know, but there are others to whom the information will be useful.

Using Giant, No. 1.

In charging a hole with giant powder, cut the cartridges into sections two or three inches long, and ram each section "well home," with a wooden tamping-bar.

Cut the end of the fuse square, push the cap on it until it nearly reaches the fulminate; then with a pair of nippers press the edge of the cap into the fuse, and in wet holes rub some grease or wax around the cap to make the same air and water tight on the fuse. To insure a perfect blast, the cap must be squeezed tight to the fuse; if loosely put on, the explosion will not be complete.

Push the fuse, with the cap attached, down the bore-hole, until the latter rests on the powder; then put about one inch of loose powder down the hole, and press lightly around the cap, so that the cap, and not the fuse, is imbedded in the powder; then fill the hole with water, or sand, or clay, or use no tamping, as you think best: or you may use a priming cartridge, which means about an inch of cartridge (smaller in diameter than the bore-hole), into which the cap, with fuse attached is inserted, the whole tied together with a string, and then let this priming cartridge down the hole until it rests on the powder. When loose powder is used, put down small quantities at a time, and ram it well home, and use a tin tube with a funnel mouth, to prevent the powder from adhering to the bore-holes.

It is of great importance that only the cap, but never part of the fuse, should be in the powder, as the burning of the latter ignites the powder and burns up all above the cap. This grade is equally good in wet or dry holes, water not affecting it in the least.

Tamping Giant Powder.

From the great strength of this blasting powder, excellent execution is done without tamping the same. Experience shows, however, that when well tamped much more work is done, the amount of power gained being in proportion to the excellence of the tamping. The first four or five inches should be tamped lightly; with the balance no special care need be taken.

Should the fuse fail, and a shot not explode, remove the tamping to within four or six inches of the powder, and put in a heavy primer, and its explosion will "set off" the main shot. Never pick out a shot of giant powder, as it is always attended with more or less danger.

Directions for the Use of Nos. 2 and 3.

Practical experience has proven both these grades superior to any thing ever used in hard and medium-hard rock. In the charging of these powders the same rules are applicable as with No. 1, with the exception that its explosive properties are weakened when brought in contact with water; therefore greater care should be observed in charging wet holes. However, in wet holes, a primer of No. 1 powder will always insure a blast.

These powders are as safe in every respect as the other. The giant powder is so safe that without the giant powder caps it is nearly impossible to explode it.

The Effect of Cold on Giant Powder.

Giant powder freezes at about 44 degrees Fahrenheit, and gradually becomes hard, when it can not be exploded with the giant powder caps.

When received at a mine, and is not already frozen, it should be kept in some warm place, where it can not freeze, to avoid the trouble of thawing it. When the powder is frozen it never should be used for blasting.

The powder may be in a granulated state, apparently soft to the touch, and yet the nitro-glycerine (the explosive property of the powder) be so chilled that its strength is only partially developed by an explosion. Do not use it in that condition.

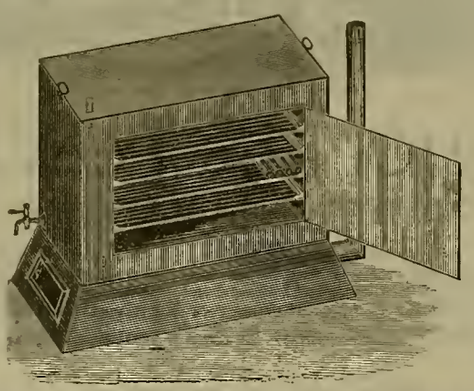
Frozen powder, when confined in a drill hole, can be exploded by using a heavy primer of thoroughly thawed giant powder No. 1. Never, under any circumstances, attempt to pick out a charge of frozen powder from a drill hole.

How to Thaw Frozen Giant Powder.

1st. Put a layer of cartridges of frozen powder in a box partially filled with hot ashes, or sand, of about 100 degrees Fahrenheit, and cover them well with the same material. Many miners prefer this to any other method of thawing powder.

2d. Put a layer of cartridges in a wooden box and place the box near the boiler in the hoisting works or mill, or other warm place, turning the cartridges from time to time until the powder becomes soft and warm. It is then ready for use. The warmer the powder is when used the greater the execution of the blast. After being well thawed it should be used at once, before getting cold again.

3d. Miners, by placing several cartridges in their boot-legs when going to work, will find the natural warmth of their bodies sufficient to thaw the powder while they are "striking in a hole."



4th. During the winter months keep the powder in a warm, dry room, on shelves or slats; when once thawed out it will remain so.

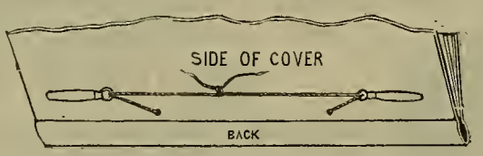
5th. The above methods are now considered the only real safe ones by which to thaw giant powder.

When the powder is soft and in a pasty condition, it is in perfect order, developing full force when exploded.

In several instances powder has been returned by consumers because they thought it was not good. In every instance, after the powder had remained a few days in a warm room, it proved by testing mortar to be of full strength, and in no way inferior to the best powder.

The furnace for thawing giant powder, and shown in the engraving, is simply a jacketed chamber containing shelves, made of wire, on which the cartridges are laid, a small furnace underneath heating the water in the jacket. By these means the cartridges can never be heated above the boiling point of water, and there is no danger of explosion. The Giant Powder Company are now making these furnaces for use at mines and on railroads. The railroads in Oregon are using these thawing furnaces in large numbers. They are easily carried along, and a fire can be built underneath them on the ground right where they stand, wherever that may happen to be. At mines, the furnace could be placed in any convenient position.

THAWING FURNACE FOR FROZEN POWDER.



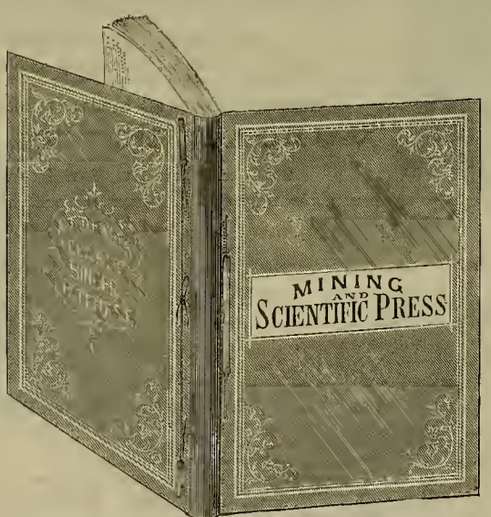


Diagram Showing Manner of Fastening.

DEWEY'S EASY ADJUSTING PAPER BINDER.

A New Periodical Binder.

The filing of newspapers for future reference, with a good binder, is an easy and pleasant accomplishment. In many instances we are told by subscribers that they hold the files of our paper of great and increasing value, and we therefore are glad to encourage their preservation by a greater number of readers, believing that in time they will thank us heartily for so doing.

The accompanying engraving illustrates an improvement in file-holders and binders which, it is believed, has advantages considerably in advance of any previously patented.

A careful examination of the illustration will give the reader a ready idea of the construction of the binder. It is composed of two stiff cloth sides, a flexible back, three rubber bands and strong braids tipped with metal points.

Newspaper or other sheets, pamphlets, etc., can be readily adjusted by laying the binder flat open before the operator, with the side having the rings at the right. Place the article to be filed face down on the left half of the cover. Stab the strings through it at least one-third to one-half inch from its back. Pass the strings through the cover and the rings and tie with a bow knot sufficiently taut to hold the sheets strongly in an elastic embrace between the lids of the cover. Care should be taken not to tie the strings too loosely. Again, they must not be tied so close as to bring the rings so as to come in contact with the holes. The simple manner in which the sides, or lids of the cover, are permitted to turn easily by the elasticity of the rubbers, is a novel and successful feature of the invention.

To produce at moderate cost a neat and substantial binder, which would be durable, easily and rapidly handled, has been the aim of the inventor, who in business has long had need of such an article. This object has been accomplished in so simple a manner that the binder has comparatively few parts. The adjustable portions are such as are not likely to be lost, disarranged or worn out quickly. The pointed strings and elastic bands are in such common use as to be obtainable for a trifle at almost any village store. It approaches book-binding to a remarkable degree.

This binder was patented by A. T. Dewey, November 21, 1882. It has been well tested by service since that date, and its construction improved from time to time, until its use seems to give perfect satisfaction.

It is the cheapest of all elastic binders yet offered to the public, and we believe will give the best satisfaction of any, and especially moderately priced binders.

The price for binders, with cloth sides, of suitable size for this paper, *Harpers' Weekly*, or the *Scientific American*, is seventy-five cents. Postage ten cents additional. It will be furnished to subscribers of this paper, with the name of the journal embossed in gilt, for fifty cents, post paid.

Machine for Folding Circulars.

A new machine especially adapted for folding circulars, price lists, etc., which are used by the business men in this country for advertising purposes, has been invented by Mr. Frank A. Brooks, of the Pacific Iron Works, 127 First street, in this city. The large number of circulars sent out by some firms makes it necessary to have one person constantly employed to fold them. This invention greatly reduces such labor, and performs the work in a much neater manner. This machine is adjustable so as to fold any of the ordinary sizes of circulars in any manner desired. It can be run by hand, foot or steam power, its capacity depending upon the adroitness of the attendant. Ordinarily, from 1,000 to 1,500 circulars may be folded in an hour.

The size of the machine is about 14"x14", and it stands 8" high, and weighs about 15 pounds. It is so simply constructed that any one can operate it, and there are no parts liable to get out of order or break. The whole machine presents a handsome appearance, and its usefulness is apparent to any who have seen the result of its work. To any one desirous of going into the business of manufacturing small machinery, the inventor offers favorable inducements.

AS THE steamer *Columbia* was entering the harbor at Panama she was struck by lightning, but the iron foremast acted as a conductor, and little damage was done. Portions of the iron of the ship became magnetized, so that alterations will have to be made. The compass will not point correctly, and a movement of the wheel will deflect it. All of the magnets on board were demoralized.

DEATHS from cholera, at Alexandria, average from eight to ten daily, chiefly among Europeans. Private advices announce that seven cases have appeared in the interior.

Metallurgy and Ores.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE

MARYSVILLE, - - - - - - CALIFORNIA.

STEEL CASTINGS

FROM 1-4 TO 10,000 lbs. WEIGHT.

True to pattern, sound and solid, of unequaled strength, toughness and durability.
An invaluable substitute for forgings or cast-iron requiring three-fold strength.
Gearing of all kinds, Shoes, Dies, Hammerheads, Crossheads for Locomotives, etc.
15,000 Crank Shafts and 10,000 Gear Wheels of this Steel now running prove its superiority over other Steel Castings.
CRANK SHAFTS, SHOES, DIES and GEARING specialties.
Circulars and Price Lists free. Address

CHESTER STEEL CASTING CO.,
Works, CHESTER, Pa. 407 Library St., PHILADELPHIA

SOLID VITRIFIED EMERY AND CORUNDUM WHEELS.

CAN BE RUN WET OR DRY,
In Either Water, Oil or Acid.

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

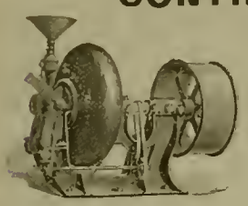
Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Olant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,



Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. I Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

[Prepared for the MINING AND SCIENTIFIC PRESS, by HENRY DEGROOT.]

Early Legends and First Important Discovery of Gold.

Although the grand discovery of gold in California occurred not until 1848, there were traditions of its existence here centuries before that time. For nearly three hundred years the impression that this was a gold-bearing country obtained among both English, French and Spanish-speaking peoples, being founded on the reports of navigators along the North Pacific coast, magnified, as was their wont, by the chroniclers of these early times. In the summer of 1579 Sir Francis Drake, the English navigator, entered the bay which now bears his name, and anchoring his vessel remained there several weeks. Before departing he took possession of the country in the name of his sovereign, Queen Elizabeth, and called it New Albion. On his return to England, with a view, probably, to giving importance to his new possessions, Drake represented the country as abounding in gold, so much so that Hakluyt, the historian, in speaking of it declares that "there is no part of the earth here to be taken up wherein there is not a reasonable quantity of gold or silver." Inasmuch as there is no gold or silver anywhere about Drake's Bay, which lies nearly in latitude 38°, and 30 miles north of the Golden Gate, the the above statement is clearly a fabrication of the great navigator. Had Sir Francis went ashore a hundred or two hundred miles further north, where the gold bluffs and beaches occur, there might have been some ground for the representation so made. But as the bay called after him is as far as he voyaged in that direction, the existence of these auriferous deposits avails not to save his veracity from successful impeachment.

But this notion about gold in California did not originate with Drake and his contemporary historian. In the same year that he visited this coast a book was published at Lorraine, in which occurs the following passage. "The soldiers of Vasquirus Coronatus having found no gold in Vivola, in order not to return to Mexico without gold, resolved to come to Quivera (California), for they had heard much of its gold mines, and that Tatarraxus, the powerful King of that country, was amply provided with riches."

After the conquest of Mexico, the Spaniards, incited by the vague stories told them by the natives of the country, were ever engaging in expeditions off this way in search of the precious metals. And when these adventurers arrived in Arizona, here again the inhabitants gave them to understand that the gold producing lands they were so eager to find lay still further to the northwest. In so advising their unwelcome visitors these people might themselves have believed what they said to be true, though possibly this was a ruse to induce these marauders to move on and thus rid the country of their presence. Between the years 1610 and 1660, more than twenty expeditions were sent out from Mexico to explore and occupy the regions to the northwest, under the impression that they abounded not only with gold and silver, but also with pearls, diamonds and other precious stones.

How signally these efforts failed of their object is denoted by the fact that prior to 1848 only a few placers, poor and of comparatively limited extent, were ever found in California; so unimportant, in fact, were these gold finds, that not much was ever heard of them outside the country and very little in it. The first of these placers, which was discovered by the Mexicans as early as 1775, is situated near the Colorado River, in the extreme southeastern angle of the state. Fifty-three years later, deposits of free gold were found at San Isidro, a hundred miles further west, in San Diego County. In 1833, some little gold was gathered in the valley of the Santa Clara river in the northwestern part of Los Angeles County. Five years later, the San Franciscoquito placers, located in the Sierra San Fernando, at a point 45 miles northwest from the Pueblo Los Angeles, were discovered. These, the most productive deposits yet met with, were afterwards worked in a small way for a period of twenty years or more. The deposits at the other places mentioned, owing to their poverty and a lack of water in the neighborhood, were never much worked. And thus it was, that with all these legends and reports about gold in California, the country, prior to the discovery at Sutter's mill, produced very little of that metal, not more perhaps than forty or fifty thousand dollars worth, all told.

As it has been surmised that the Mexican government were not well informed as to the existence of gold in California at the time that they parted with the country under the treaty of Guadalupe Hidalgo, to it may be pertinent state here that such was not the fact. The late Gregory Yale, in preparing his well known work on the legal titles to mining claims and water rights in this state, being obliged to make extensive research among early Spanish archives, discovered there the following document, showing that the Mexican authorities were at that time not only advised as to the existence of placer mines in California, but that the extent and importance of these deposits were greatly exaggerated by the party communicating this information. This document, which consisted of a letter addressed to the President of the Republic by Manuel Castanares, Representative in the National Congress from the Department of California, was published in the city of Mexico in 1845, though it bears the date of March 2nd, 1844, nearly four years before the Marshall-Sutter discovery of gold. This letter, translated for the above work by the expert Spanish scholar, Charles G. Yale, reads as follows:

"The gold placers discovered in the course of last year have attracted the greatest attention, for they extend nearly thirty leagues. The good quality of this metal is made manifest by the certificate of its assay, which was made at the Mint of this Capital, and by the sample which I send to Your Excellency. In order to develop the great elements of wealth in which California abounds, measures ought to be taken only after mature deliberation. I therefore shall have the honor within a few days of presenting to Your Excellency a memorandum detailing these elements, and the means of developing them with very little sacrifice."

A few months later Representative Castanares addressed to the President of the Republic the following additional paper on the same subject:

"The mining interest in California is of great importance, and I have the satisfaction of assuring you that it forms one of the most valuable resources of that department. Besides the silver mines which are found there, and various other mines which have actually yielded metals, the gold placer, especially, is worthy of great attention, which, extending nearly thirty leagues, was discovered lately, together with mines of mineral coal. It is painful for me to have to confess that mining is in a worse state than agriculture; the latter is in its infancy; the former, it can be said, is not yet born, notwithstanding that, according to the nearest estimate of reliable persons in Los Angeles on my departure from that town in December, 1843, there were in circulation about 2,000 ounces of gold, which had been extracted from the above-mentioned placer, the greater part of it destined to go to the United States. This metal contains, according to the certificate of its assay by the Mint of this Capital, which I sent to the government at the beginning of this year, twenty-two carats two and a half grains of gold, fifteen grains of silver.

September 1, 1844."

The foregoing, though a gross exaggeration of the real facts, establishes how thoroughly the Mexican authorities were posted as to any and all gold discoveries that had up till that time been made in California.

Owing to various incidents and events connected with the acquisition of this country by the United States, and the efforts made by our government for establishing steam communication with the Pacific Coast, some have thought that the authorities at Washington had some unpublished advices in regard to the existence of gold here prior to the consummation of the treaty with Mexico and to their contracting for steamers to ply on the routes between New York and San Francisco. In support of this theory, the fact is cited that within six weeks after the time that gold was discovered at Sutter's mill, the treaty ceding to us this country was signed by the contracting parties, the Mexican Commissioners being ignorant of this important event, and our government affecting ignorance of it also. Then, the vessels of the Pacific Mail Steamship Company were required to be ready for service by the month of October, 1848—just the time when the news of the gold find, having excited the more adventurous, had inspired thousands with a desire to emigrate to the new El Dorado. Pointing to this singular contatenation of events, it is argued that the American goverment must have been actuated by some special reasons for burrying treaty negotiations to a close, and for requiring the steamship company to have their first vessel ready to sail at this particular time. In the absence of any stronger evidence than the above, it is fair to presume, however, that officials at the national capitol were no better posted in regard to the existence of gold in California than was the general public, the events cited being mere coincidences, such as might easily happen in transactions of this kind.

That the government was in possession of more full and perhaps accurate information in regard to the mineral and other material resources of this country than the world at large is likely enough, as it would naturally take measures while negotiating the purchase of so much territory to ascertain some thing in regard to its probable worth. In the month of March, 1846, Thomas O. Larkin, then United States Consul at Monterey, in an official letter to James Buchanan, Secretary of State, writes as follows: "There is no doubt but that gold, silver, quicksilver, copper, lead, sulphur, and coal mines are to be found all over California; and it is equally doubtful whether, under their present owners, they will ever be worked." In this expression of opinion, so temperate compared with the statements contained in the letters of Manual Castanres, our Consul may be understood to convey the idea that these various metalliferous deposits, until then so neglected, would be actively worked were the country owned by the United States.

In 1841, James D. Dana, mineralogist to the Exploring Expedition under Commodore Wilks, which that year visited this Coast, made an overland trip from Oregon to San Francisco. In a book on Mineralogy, published by him the next year, this author states that gold was to be found in the Sacramento Valley, and that he had observed auriferous rocks in Southern Oregon, but that he did not consider these deposits of any practical importance. That Consul Larkin, in his letter to the Secretary of State, was speaking in an indefinite way, having but vague ideas as to the extent or value of the deposits he alludes to, is evident from the fact that he makes mention of silver, quicksilver, coal, and sulphur mines, concerning which nothing certain could then have been known. He had, probably, no more exact knowledge of such mines than was common to the inhabitants of the country at that day. They had observed in certain places indications of the presence of these metals and minerals, and surmised that there might be valuable deposits at these points. With regard to gold, Mr. Larkin could speak with more assurance, as small quantities of that metal had for a number of years before been taken out at the San Francisquito placers and brought to Los Angeles, where it was sold at the rate of about twenty dollars per ounce. As these were the placers to which Senor Castanares must have referred in his communications to the Mexican government, the extravagance of his language in describing them becomes manifest, when we reflect upon their limited extent and the sorry showing they have since made in the gold product of the country.

The foregoing comprises about all the knowledge extant touching the occurrence of gold in California prior to January, 1848.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F

FOR WEEK ENDING OCTOBER 23, 1883.

286,993.—FLOWER-POT HOLDER AND SHIELD—Wm. A. Birch, S. F.

287,166.—PHONOGRAPH—C. C. Reynolds, Prescott, A. T.

287,326.—DRILLING MACHINE—John Richards, S. F.

287,173.—ORE CONCENTRATOR—C. C. Rueger, S. F.

287,178.—CAISSON GATE—Geo. F. Schild, Vallejo, Cal.

287,198.—CRANK HANDLE FOR LIFTING-JACKS—J. M. Vance, Eureka, Cal.

287,202.—CAR AXLE—A. Walton, S. F.

10,658.—TRADE MARK—Franco-Cal. Packing Co.

3,265.—LABEL—Pacific Vinegar Works, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

AS A TRUE and efficient tonic, and one that excels all other iron medicines, take Brown's Iron Bitters.

The Distant Sierra.

(CONTINUED FROM PAGE 286.)

posed to be the highest in that district. When we returned to camp that night we received, by mail, from Visalia, the news of President Garfield's death, which occurred on the 19th. At your correspondent's suggestion, this handsome peak was named after our worthy President, who had fallen by the hand of a dastardly assassin. We trust the mountain will ever retain the name. It is very distinctly recognized from our prairies. The altitude of Miners' Peak is approximately 12,800 feet, and of Mt. Garfield, 13,100.

Bullion Peak is a regular, snow-capped cone, near Farewell Gap and the head of Little Kern River, which, though a stream twenty-five miles long, does not appear on any map of California yet prepared.

Every point marked in the accompanying engraving has now been explained except the letter "B." This represents the locality of the great and celebrated canyon of the main Kern, at about its middle point.

The Main Kern,

Rising near the base of Mt. Benet, along the steep southern slopes of the high divide between it and King's River, runs almost due south for at least 40 miles, through the longest and grandest canyon of all the Sierra Nevada. Its perpendicular walls are from 2,000 to 4,000 feet high, and scarcely a mile apart; its waterfalls are from 1,500 to 3,000 feet high; and it is fed on the east by Tyndall Creek, Moraine Creek, Whitney Creek, Loomis Creek, and Volcano Creek, in succession, from north to south; and on the west by Cone Creek, Shagoopah Creek, and Falls, and Crabtree Creek, having but two possible trails for entrance and exit over its east face, and two on its west face, for its length of 40 miles. The Little Kern empties into it from the west, still farther south. The Kern and its tributaries abound with the golden, or rainbow, trout.

Here, among our highest mountains, the curious and beautiful red-snow occurs, identical with that of the Arctic regions and the Alps, caused by that microscopic fucoid plant, *Protococcus nivalis*. From July to September it is found in the Mineral King district, near the White Chief ledge, and in Farewell Gap; also, just north of Mt. Abert, the Old Mexican mine in the head of Jenny Lind Canyon, and along the high ridges and gorges near Mt. Whitney, at altitudes from 10,000 to 12,000 feet.

Errors Corrected.

Having now reviewed with my old friends and acquaintances of the PRESS this 120 miles, or thereabouts, of the grand panorama of our California Alps, I shall close this sketch by correcting three important errors in vogue about the mountain region we have been discussing.

The expeditions of 1881, already referred to, decided these matters conclusively. 1st. It has been stated in many ways that the snows of Mt. Whitney feed the San Joaquin and King's rivers as well as the Kern. This is all a mistake. As pointed out above, of these three large rivers only the Kern is fed by it. The sources of Bubb's Creek and Roaring River, the extreme southern tributaries of King's River, are fully eight miles north of Mt. Whitney, with a lofty rocky barrier between them, while the south fork of the San Joaquin does not come nearer than 40 miles to Mt. Whitney, its extreme sources being on the northeastern slope of Mt. Goddard, between it and the Palisades. 2d. By some the main Kaweah River is supposed to flow from Mt. Kawcah. The fact is that the whole of the Kaweah Buttes furnish water to no stream but the Kern, and that through Cone Creek, Crabtree Creek, and the small creeks which form the high falls on the west face of Kern Canyon. 3d. The height of Mt. Whitney has heretofore been overestimated.

Altitude of Mt. Whitney.

During five days of careful observations by Prof. Langley's party, from Sept. 1st to 6th, 1881, the mercurial barometer varied from 17.50 to 17.60 inches, while the aneroid of your correspondent gave 17.55 to 17.60 on Sept. 6th. Prof. George Davidson did me the favor to have these elements worked out at the Coast Survey Office, by the formulæ for the mercurial barometer, comparing the reading on Whitney with the corresponding readings of the Signal Service instruments at San Francisco on the same dates. These figures gave the altitude about 14,700 feet. I worked out the same by the formulæ for aneroids, using the readings of corresponding dates in the Signal Office at Visalia. This gave 14,800 feet. Hence, 14,750 feet is no doubt more nearly correct for the altitude of Mt. Whitney than 15,000 feet. Even at these figures, Mt. Whitney is still the highest mountain in the United States except Mt. St. Elias in Alaska, with its 19,500 feet of altitude. An interesting point in our Tulare Sierras is a ridge where the sources of King's, Kaweah and Kern rivers are within a stone's-throw of each other. This point is immediately north of Mt. Abert, the most northerly peak of the Kaweah Buttes, and about ten miles due west from Mt. Whitney. From there the main Kaweah runs nearly west, Roaring River runs northwest, into King's River, while Cone and Crabtree creeks run southeast to the Kern.

A Moonlight View

Of our distant Sierras is a phenomenon peculiar to this locality. What! See mountains 70

miles distant by moonlight? Yes, incredible as it may seem to those who have never witnessed this wierd and mysterious view of our snowclad mountains, they are sometimes seen by moonlight, under two conditions: Just as the moon is rising behind them, and a little before, a narrow waving line of pale golden light marks the profile of the Sierras, as the snow on the summit line is illuminated by the moon's rays. But the most peculiar sight is when the moon, near the full, has reached the zenith on our clear, cold winter nights. Look then to the eastern horizon, and there, dimly but surely, you see the vast snow fields of our Sierra Nevada reflecting the soft light of the moonbeams. At first you think it is white, fleecy clouds, but as you gaze steadily you see there is no motion, no change, as there would be if it were clouds. It remains there as calm and unchanging as the solid mountains themselves appear in the sunshine. You are really viewing by moonlight the perpetual, Arctic-like snow-masses of our California Alps.

Conclusion.

Having now examined together somewhat in detail this wonderfully grand panorama of our higher Sierra, we must take leave of them, just as the writer of this sketch will soon do of all the scenes of our beloved California; but the memory of these grand views, once seen, will always remain with a sincere admirer of nature, and of these grandest achievements of nature's Architect. Just as these everlasting mountains appear to us now, they have appeared to man's eye for at least forty centuries—from the time when the giant redwoods of our mountain meadows first began to burst through their tiny seed shells. There they have stood, so little changed by the frosts of succeeding winters as to appear ever the same,—standing, poetically, as the sentries of this great and fertile valley; practically as its ventilators and air purifiers, and as a rich storehouse of waters, metals, building stones and timber. We see them today just as the forefathers of the American races saw them many centuries ago, when they came from Asia by way of Behring's Straits and the Aleutian Islands, along our Pacific Coast, and through Tulare Valley—the Toltecs and the Aztecs—on their way to the table-lands of Mexico. There they stand, just as they have been seen and venerated for ages by the wild Indians, for whom a large part of them, no doubt, were ever shrouded in mystery.

As we see them, they are likely to remain till the end of time, as one of the most tangible proofs of the unchanging nature of God's laws, and among the noblest monuments of his handiwork.

HUBBER'S HEATER AND PURIFIER.—This California invention has been very successfully applied on this Coast as an economizer of fuel and as a purifier. Where water contains minerals or impurities the purifier has acted so as to perfect a complete separation of the impurities, so that clear, pure water passes up into the boiler. Its action is such as to remove scale from boilers and prevent greatly its deposition; and, owing to the pure state of the water entering the boilers, the evil of foaming is prevented, while the injury to valves and packing that result from the passage of grit is obivated. This heater and filterer has been put at work in this city in several places where the water from the wells is bad, and those who have used it express their satisfaction with the results. The appliance received the first premium for the best heater and purifier at the recent Mechanics' Institute Exposition in this city. We shall shortly describe it more fully.

Is your wife's health poor? Are your children sickly? Give them Brown's Iron Bitters. It will revive them.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $10 or less, 8 cents; for registered letter, in addition to regular postage (3 cts. per half ounce), 10 cts

STRENGTH

to vigorously push a business, strength to study a profession, strength to regulate a household, strength to do a day's labor without physical pain. All this represents what is wanted, in the often heard expression, "Oh! I wish I had the strength!" If you are broken down, have not energy, or feel as if life was hardly worth living, you can be relieved and restored to robust health and strength by taking BROWN'S IRON BITTERS, which is a true tonic—a medicine universally recommended for all wasting diseases.

501 N. Fremont St., Baltimore

During the war I was injured in the stomach by a piece of a shell, and have suffered from it ever since. About four years ago it brought on paralysis, which kept me in bed six months, and the best doctors in the city said I could not live. I suffered fearfully from indigestion, and for over two years could not eat solid food and for a large portion of the time was unable to retain even liquid nourishment. I tried Brown's Iron Bitters and now after taking two bottles I am able to get up and go around and am rapidly improving.

G. DECKER.

BROWN'S IRON BITTERS is a complete and sure remedy for Indigestion, Dyspepsia, Malaria, Weakness and all diseases requiring a true, reliable, non-alcoholic tonic. It enriches the blood, gives new life to the muscles and tone to the nerves.

DELINQUENT SALE NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, Cal.; location of works, Drytown, Amador county, Cal.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 4) levied on the 27th day of September, 1883, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Martin, A, Trustee	34	5,000	$500 00
Martin, A, Trustee	35	5,000	500 00
Martin, A, Trustee	38	5,000	500 00
Martin, A, Trustee	42	5,000	500 00
Martin, A, Trustee	43	10,000	1,000 00
Martin, A, Trustee	48	2,000	200 00

And in accordance with law, and an order of the Board of Directors, made on the 27th day of September, 1883, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, No. 224 California Street, San Francisco, Cal., on MONDAY, the 19th day of November, 1883, at the hour of 1:30 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

CHAS. T. BRIDGE, Secretary.

OFFICE—224 California St., San Francisco, Cal.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent Attorneys, enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., San Francisco. Elevator 12 Front St.

INFORMATION WANTED.—Information is wanted of Wm. Erskine, who has been living near Hailey, Alturas county, Idaho Territory, for two years past. His wife has not heard from him since last Spring. He was President of the Miners' Union of Silver City, Idaho, five or six years ago. Any news of him would be thankfully received by Mrs. Hannah Erskine, of Nevada City, Cal., or R. H. McDonald, Los Angeles, Cal.

THE ROLLER ORE FEEDER.
[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

IMPROVED FORM
—OF—
HYDRAULIC GIANT

We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.

All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the

JOSHUA HENDY MACHINE WORKS,

49 and 51 Fremont Street, - - - San Francisco, Cal.

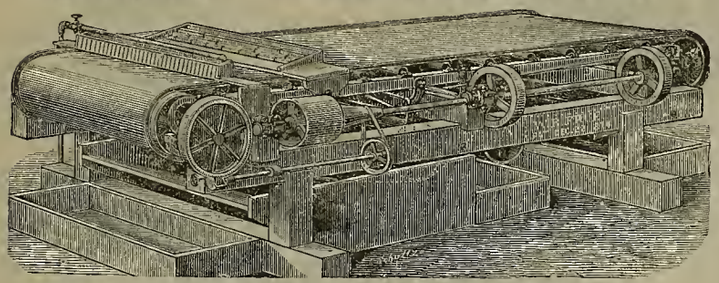
NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.



Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

San Francisco Pioneer Screen Works

J. W. QUICK, MANUFACTURER.

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens can at all times contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

QUARTZ MILL FOR SALE.

A TEN-STAMP QUARTZ MILL COMPLETE, including Battery Frame, ten 750-lb. stamps, high mortars; one 9-foot Knight Water Wheel; about 1,000 feet iron pipe, 6 to 10 inches; one 14-foot buddle; shafting, belting, copper plates, etc. All in good condition and nearly new. At GRIZZLY FLAT, EL DORADO COUNTY, CAL.

Inquire of L. S. Taylor, Attorney-at-Law, Sacramento or Wales L. Palmer, at Golden State and Miners' Iron Works, 237 First St., San Francisco.

JET PUMPS.

THE CHEAPEST AND BEST

STEAM PUMP for Lifts from 10 to 70 ft.

FOR IRRIGATING PURPOSES

And all General Work where a Simple Durable Pump is Required.

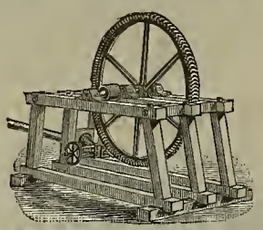
NO VALVES! NO PISTON!

NO OIL REQUIRED!

Can be Run by a Child.

EACH PUMP GUARANTEED.

PRICE—One-tenth of an ordinary Steam Pump, same capacity.



Call and See One in Actual Operation.

The Atlas Engine.

The engraving on this page represents the slide valve engine made at the Atlas Works, and the agency of which for this Coast was not long since obtained by H. P. Gregory & Co. It is claimed for these engines as their principal feature that they are simple and strong, with large and carefully fitted bearings, and superior distribution of metal for the working strains. They are particularly adapted for heavy work. The company making them employs 400 men exclusively on these engines and boilers; and from the fact of their giving their undivided attention to one class of work, are enabled to build cheap and well. T. M. Antisell, piano maker in this city, is using one of these engines. They are also in the saw mills of Andrew Markham, of Duncan's Mills. F. Hind, Santa Cruz; Clow Bros., Booneville, Lake Co.; Hastings and Tunis, Lakeport, and at several other places where they are giving satisfaction.

The engraving shows a front view of the engine. The cylinder is well made and the proportions are sufficient to admit of a piston speed of 600 feet per minute. The frame or bed plate is of box form, having a closed top. The main bearing is of improved design. The connecting rod is of forged wrought iron, and boxes of gun metal. The governor has an automatic stop motion and is of approved construction. Durable and self-adjusting packing is used for piston. The main shaft is forged from selected iron, and is of large diameter. The band-wheel is of ample size to transmit by belt the full power. A plunger pump and heater go with the engine.

THE ATLAS SLIDE VALVE ENGINE.

THE shipments of quicksilver from this port during the month of October amounted to 2,881 flasks, including 1,800, to New York, the largest quantity sent to that market by water in any single month in years. There were only 35 flasks to Hongkong, the smallest quantity sent to that market in years. The shipments to Mexico were only 500 flasks, owing to the quarantine regulations there. The total for October, 1882, was 2,120 flasks. The shipments for the ten months ending October 31st were 37,731 flasks, worth $750,013. Though we have shipped 7,700 more flasks this year than last the remuneration is $127,000 less.

THE Mount Diablo coal mine produces about 7,500 tons a month.

Profits of Mining.

The idea of ex-Senator Stewart, of Nevada, going to New York and telling the people there that mining is not and never has been profitable, strikes any one knowing anything of the subject as extremely ridiculous; and it is still more absurd to see newspapers here copying the interview, and partly indorsing it. Mr. Stewart, however, has been misrepresented. What he did say, in answer to a question as to why hydraulic miners did not build their own dams, was "that if they were compelled to build the dams the business would be no longer profitable. It is too much of a burden on them to take care of the tailings deposited by their predecessors."

There is no possible way of verifying any estimates on the profits of mining. Many people—in fact most people—confound the stock market profit and losses with those of mining itself. California has produced a long way over a billion of dollars in gold since mining was commenced; and even if it cost that much to get it out—which it did not—the world is richer by that billion of dollars than it was before. It is pure production. The new dollar is so much added to the world's wealth. On this subject, in a recent government work on the Mineral Resources of the United States, the following official statement is made:

The production of gold and silver, like that of other commodities, is of course not one of clear profit. Indeed, a saying that it costs one dollar in coin to produce one dollar in bullion has gained more or less credit; and though this opinion has been abundantly shown to be unfounded, and while also any attempt to estimate the profit gained to the country by the mining of the precious metals is mere guesswork, it is still quite probable that $500,000,000 of the gross total has been net profit.

The Manufacturers' Association.

The final arrangements for perfecting the organization of this Association will not be made until next week, when the committee will report. A meeting was held this week, however, with Irving M. Scott in the chair, and J. H. Gilmore as Secretary. A resolution was presented by A. S. Hallidie, as follows:

Resolved, That this Association proceed to form itself into a body politic and incorporate under the laws of the State of California, to be known as the "Manufacturers' Association of the state of California," and that articles of incorporation be immediately proposed and executed by the necessary number of its members, and filed in the proper offices as required by law.

Resolved, That we now proceed to elect from our number eleven persons who shall act as directors and trustees for the first year.

The resolution was adopted, and a ballot was taken and the following gentlemen were elected: A. S. Halladie, W. Harvey, W. T. Garratt, Irving M. Scott, M. W. Spaulding, S. P. Taylor, A. H. Phelps, David Kerr, Albert Tubbs, Arpad Haraszthy and Isaac Hecht. The meeting then adjourned until Monday next at 3 P. M.

THE mines of the section distinctively known as Southern California are increasing in their output at a capital rate. The fact is, that from the region which is unmistakably tributary to Los Angeles three hundred thousand dollars a month is being turned out in bullion, and this is but the initial of a splendid era of development. The most prominent contributors to this superb total are the King, which turns out between $50,000 and $60,000 a month, the Providence Mountain, with between $60,000 and $70,000, the Albambra, with about $30,000, and numerous other mines which turn out bullion in lesser measure.

Patenting Mines.

So much has been said about the benefits of patenting mining claims that it would seem as if all miners would recognize them. It is a fact, however, that too many neglect this important duty, and when the time comes when they have an opportunity to sell, it is lost through neglect of ability to guarantee title. A government patent is accepted as a guarantee of good title. Before it can be procured certain forms have to be gone through and adverse claims settled, so that a patented claim is free from possible legal entanglement, too apt to encircle those which have not been put to test.

So well are these facts recognized by experts and capitalists, that a very good mine will often be refused if not patented. The parties who buy unpatented mines now, insist on retaining part of the purchase money until the patent is forthcoming. And this is no more than just. If there is any flaw it will come out during the patent application proceedings, though none may have been apparent during many years of undisputed possession. Instances are so numerous where flaws have appeared that purchasers are not safe unless they protect themselves in some way like this. Every miner with a claim worth working ought to consider it worth patenting. A good mine with a poor title is not an enviable property; better have a comparatively poor mine with a good title. A man with a promising location which is patented will stand many more chances of seeing it sold than one of which he has merely a possessory title. These questions should be seriously considered by all miners, who, while developing a good property, should see to it that they perfect a good title also.

THE steamer Otter has brought to Victoria $1,600 in gold dust, which was obtained from McDame and party, which they discovered on a new creek, a tributary of the Skeena. The party panned out from eight to twenty dollars per day by hand, and they will winter in the new diggings, expecting great results.

THE pay roll of the Ophir, Mexican and Sierra Nevada aggregates $30,304. The pay roll of the Consolidated Virginia, C. and C. shaft and California amounted to $12,171.75; Union shaft, $9,649.25; Utah, $3,769.50.

CORRESPONDENCE.

An Arizona Mine.

Ancient Mining Ground Re-worked.

EDITORS PRESS: In company with a rather dilapidated vehicle, called by courtesy a "stage," dragged at a funeral pace hy two forlorn representatives of equine ahility and incompetence, and crammed with demijons, hundles and hoxes, among which the five passengers were expected to hestow their hundred delicate pedal extremities as best they might, the whole under the superintendence of an ohliging and companionable jehu, whose musical sihilation filled the intervals of conversation with melodious warblings, I set out from Prescott to view the now famous mines of the United Verde Copper Company. I say in company with the aforesaid vehicle, etc., because although I and the other passengers were enahled to travel on wheels over the level or descending portions of the road, yet such was the disproportion of the weight to be moved to the power provided for moving it, that whenever a hill was to be ascended (and several pretty long oues were encountered) it hecame necessary for all that portion of the load that was capable of self-propulsion to have recourse to that, the said power harely sufficing to impart motion to the inanimate part.

At two hours past the proper time we arrived at Gillett's station, where a substantial square meal awaited us for the moderate consideration of "four hits," the proprietor of the wayside hotel not having yet attained to the altitude of avarice which characterizes some of his confreres in these parts. Ahout dark we reached the smelter, having made the stupendous journey of 27 miles in the short space of 10 hours.

The letter of introduction from His Excellency the Governor, with which I was armed, was scarcely needed to insure me a cordial reception; and the kind hospitality of the Superintendent, Mr. F. F. Thomas, soon made me feel at home. Indeed, a pleasanter set of gentlemen than the officers of this company, including Mr. Burk, the New York Secretary, who is here on a mission of husiness, it would be difficult to find; and small hlame to them for that same. The ownership of such a property as I saw here would make the veriest curmudgeon that ever lived to crack his crusty visage with an unwonted grin.

Primitive Miners.

This mine, or group of mines, was discovered at some ohscure date in the remote past of this interesting country, though whether hy Spanish explorers or by members of some native tribe I can not say. Whoever they were, they seem to have sought the red oxide of copper, in pursuit of which they burrowed into the mountain in a style more suggestive of gophers than of human miners. It has been suggested that they used this richly colored ore as a pigment; I did not hear of any remains of metallurgical operations having heen found.

In addition to the excavations made by these primitive miners, they have left their traces in the form of fragments of painted pottery, stone hammers, implements of horn, bones (probahly of deer), and a piece of wood on which was painted a red cross, suggestive both of a Christian people and of the use to which they applied the ore which they extracted.

The Mines were Rediscovered

And partially opened some four or five years ago, and when bonded by the present owners were already in a coudition of developement to justify expectations which are now much more than realized.

The history of this property, as of many others in Arizona, affords a flagrant instance of the unreliahility of reports made hy geological experts, one of whom, a well known gentleman of considerable scientific attainments, refused it at $25,000. The preseut superintendent (who, though a miner and metallurgist, does not, I believe, claim to be a geologist to any alarming extent) took it in at $113,000—thought he had a good bargain then, and knows it now. In oue respect, however, it seems that even Mr. Thomas was imposed on. He bought the property as a copper mine, aud now he finds that it is a silver mine also. Such instances of fraud might he more frequent without discouraging the doughty capitalists of New York.

I shall not attempt a description of the mines further than to say there is a very large quantity of very good ore in sight. The question as to whether they have an enormous vein, a group of large veins, or simply an immense deposit of ore without a true vein, is one which the future must answer.

The Ores

Are exceptioually free from arsenic and antimony, carrying merely a trace of the first, and, so far as I know or hear, not even a trace of the second. The mines on the south side of the canyon are partly in "oxysulphide" ore, and in one shaft in the old workings they got into calchopyrite; yet there is on this side a very large quantity, I should think thousands of tons, of oxidized ore, while on the north side, where the country is less compact, they are extracting oxides and carbonates from a depth of 100 feet, while the dryness of the ground and the existeuce of wide and deep crevices, or perhaps I ought to say "crevasses," insure a continuance of the same for at least another 100 feet in depth.

They Have One Furnace,

Which, with its appurtances, cost ahout $20,000. They smelt from 40 to 50 tons of ore per day's run, keeping the furnace fully supplied, and were accumulating ore on the dump without the necessity of stoping. With the exception of a little limestone, nothing but ore and coke goes into the feed hole. The slag runs like water, and the metal, of which they produce from 6 to 8 tons to the day's run, contains about 97 per cent. of copper, and from 300 to 600 ounces of silver to the ton. The profit on such a day's run is from $1,000 to $2,000. The only cause of delay of any consequeuce which has heen encouutered since starting has heen the want of coke, which will soon he remedied by putting more teams on the road. Another furnace is to be up next spring, which will bring the freighting husiness of the company up to a total of about 1,200 tons per month; besides which there will he all the business of the town, which is sure to grow in the vicinity of such a mine. This is a point for the projectors of, and objectors to, the railroad from Prescott to the A. and P. Great credit is due to Mr. Thomas for the energy and skill displayed in putting this property on a paying hasis. As he is understood to own a pretty fat slice of the stock, it may he hoped that his reward will he commensurate.

C. H. A.

Mexican Mines.

EDITORS PRESS:—I have frequently seen and read your illustrated paper, and under the head of "Mining Summary" I notice all mining localities and districts, hut seldom do I see much information as to mines in the Mexican republic. It is, however, a fact that a good many foreign interests are invested, with the most favorable results, in this country. The fact is, I suppose, that foreign interests in this country, productive as they may he, keep quiet, and do not wish to make it known to the world that they are in a well doing country.

The region here ahounds in mineral veins, which are laying idle, without enterprising capital to investigate their riches; although at present a good many foreigners, principally Americans, are looking into the wealth which surrounds us. Not alone is the mineral product attracting the attention of the world, but the agricultural and cattle lands of Mexico are being looked to. Enterprising people are taking hold of them, and they will greatly increase in value after the lapse of a few years. The country is virgin and abounds in all kiuds of materials and facilities—wood, water, telegraphic communications to all parts of the world, as well as ample wagon roads.

Speaking of this our mineral district, I have not the slightest hesitation in declaring that we have more personal security than even in your city. We have no such outrages, robberies, etc., in this country, such as I frequently see published in your San Francisco publications. Capital is secure to the utmost extent, and the authorities comply strictly to the laws. Foreign interest is respected and protected with great vigilance.

An American company, incorporated in your city—the Anglo-Mexican Mining and Land Company—established here lately within twelve miles of this town, is putting up reduction works of the capacity of fifty tons daily. It has oue of the grandest mining properties in this country—a mine newly discovered, of immense riches and fabulous quantity of ore. Such mines can he found in this country; aud I have no hesitation in referring to a property as large in quality and quantity in free-working ore as your Comstock vein of Virginia City, Nevada, at a distauce of ahout twelve miles from this town, and in close proximity to the mines helonging to the above named company. I will willingly give more particulars to parties wishing to enter or purchase a solid mining property.

The country is the healthiest in America. It was not until recently that we had severe attacks (at Mazatlan only) of bilious remittent fevers, which were mistaken there for yellow fever, which, until the present time, never prevailed here. At present the disease has nearly disappeared. It was dangerous only to the poorer class of people and the troops. The cause of the disease was, no douht, the increased heat during last month, without any any rain. The cool seasou has appeared, and no further fear as to sickness.

I could address you at greater length, but I fear to take up too much space; and I shall he ready always to give you and the public general views as to our country and its undeveloped wealth, should it he welcome.

BRUNO SYMANSKI.

Cosala, State of Sinaloa, Mexico.

FIFTY thousand francs is the prize which France offers for the discovery which shall enable electricity to be applied economically in one of the following directions: As a source of heat, of light, of chemical action, of mechanical power, as a means for the transmission of intelligence, or of the treatment of disease—the prize heing opeu to all nationalities, and to he awarded in December, 1887.

Trials of Rock Drills and Pulverizers.

The important trials, under the auspices of the Royal Cornwall Polytechnic Society, in which such general interest has heeu felt, having heen completed, the judges have made their report, giving at the same time such details as prove that they took every precaution to make the competitions reliable tests.

In pulverizers the competing machines were that of Messrs. Michell and Tregoning, of Redruth, that of Captain Nicholas, of West Basset mine, and that of Mr. Arunden Pryor, of St. Blazey Gate. Each in turn was worked hy the same steam eugine, and the coal consumed carefully weighed. The trial was, first, grinding hurnt leavings one hour each; and, secondly, grinding roughs one hour each. Before bruising the burnt leavings assayed 6 pounds of black tin per ton, and the roughs 2 pounds per ton, without the use of the hammer in the assays.

On the burnt leavings Messrs. Michell aud Tregoning's pulverizer, with a consumption of 1 cwt. of coal, pulverized 6 cwt. 2 qrs. 13 lhs. of stuff, so that 57 lhs. of hlack tin per ton could he washed therefrom without further bruising, equal on the quantity bruised to 19.25 lhs. of hlack tin. On the roughs, with a consumption of 2 qrs. 3 lhs. of coal, it pulverized 2 cwt. 3 qrs. 2 lbs., so that 16 lhs. per ton could he washed therefrom without further bruising, equal on the quantity ground to 2.2 lhs. of black tin. The work done by this pulverizer in the two trials was, therefore, sufficient to produce from 9 cwt. 1 qr. 15 lhs. of stuff 21.45 lbs. of black tin by the consumption 171 lbs. of coal.

Capt. Nicholas's pulverizer, on the burut leavings, hy a consumption of 3 qrs. 23 lhs. of coal, pulverized 7 cwt. 2 qrs. 12 lhs. of stuff, so that 41 lhs. of black tin per ton could he dressed therefrom, equal to 15.87 lhs. of hlack tin on the quantity hruised. On the roughs, this pulverizer, with a consumption of 2 qrs. 21 lhs. of coal, pulverized 3 cwt. 3 qrs. 10 lhs. of stuff, so that 16 lhs. of hlack tin per ton could be washed therefrom, equal to 3.1 lbs. on the quantity hruised. The work done hy this pulverizer in the two trials was, therefore, sufficient to produce from 11 cwt. 1 qr. 22 lhs. of stuff 18.97 lhs. of black tin, hy a consumption of 184 lhs. of coal.

Mr. Pryor's machine, on the burnt leavings, hy a consumption of 2 qrs. 21 lhs. of coal, pulverized 5 cwt. 1 qr. 15 lbs. of stuff, so that 19 lbs. of black tin per ton could be dressed therefrom, equal to 5.1 lbs. of hlack tin on the quantity ground. On the roughs, this machine, with a consumption of 21 lbs. of coal, pulverized 2 cwt. 2 qrs. 4 lbs. of stuff, so that 14 lhs. of hlack tin per ton could be washed therefrom, equal to 1.8 lb. of hlack tin on the quantity ground. The work done by this pulverizer in the two trials was, therefore, sufficient to produce from 7 cwt. 3 qrs. 19 lbs. of stuff 6.9 lhs. of black tin, by a consumption 98 lbs. of coal.

These results show that the quantity of tin obtainable hy the consumption of 1 lh. of coal was, in the case of Messrs. Michell & Tregoning's pulverizer, .125 lb.; Capt. Nicholas's pulverizer, .103 lh.; and Mr. Pryor's, .70 lb. The judges recommend to the general committee the award of their first silver medal to Messrs. Michell & Tregoning.

With regard to rock drills, the competing machines were the Excelsior, the Stephens and the Eclipse. An attempt was made to have the trial at Falmouth docks, with steam, but it was found that the pistons of the Elcelsior and Eclipse were too well fitted to their cylinders to run with steam, and the pipes for conveying the steam having proved defective, it was decided, through the kindness of Capt. Bishop, to transfer the trial from Falmouth docks to East Pool mine, in order that compressed air might be used, for which the machines are designed. At East Pool the test was speed in boring, each machine to hore one hole, in size equal to one-fourth of the area of its cylinder; each machine to use compressed air of the uniform pressure of 65 pounds per inch. The results were:

The Excelsior, 4-inch cylinder, commenced with a bit 2 1-16 inches in diameter, and hored 19 inches, when the hit was reduced to 1 11-32 inches. Another hit was then used, commencing at 1 9-16 inches, which, after horing 14½ inches, measured 1 3-16 inches. Total depth bored, 33½ inches, in 6 minutes 30 seconds.

Stephens's machine, 3½ in. cylinder, then commenced with a bit 1 25-32 in. in diameter, and bored 18 in., when the hit measured 1 18-32 in. A second bit was then used, commencing at 1 9-16 in., which, after boring 15½ in., measured 1¼ in. Total depth bored 33¾ in., in 5 min. 40 sec.

The Eclipse, 2½-in. cylinder, commenced with a hit 1 17-32 in. in diameter, and, after horing 13 in., measured 1 15-32 in. A second bit was then used, commencing at 1⅜ in., whicb, after horing 13¾ in., measured 1 5-16 in. Total depth hored 26½ in., in 6 min. 10 sec. The hole drilled hy the Eclipse was greater in area than one-fourth the cylinder, whilst the holes drilled by the Excelsior and Stephens were under the required size.

The rock cut hy each was: the Excelsior, 67 cubic inches; Stephens, 63.6 cubic inches, and the Eclipse, 41.7 cubic inches, equal to a hole of the specified ratio to the cyliuder of 21.33 inches in depth in the case of the Excelsior, 26.44 the Stephens, and 34 the Eclipse. The speed per minute at which each machine hored equal to a hole of one-fourth the area of its cylinder, was: the Eclipse, 5.51 in.; Stephens, the 4.67 in.; and the Excelsior, 3.28 in. The judges recommended to the General Committee of the Polytechnic the award of the first silver medal to the Eclipse for this competition. They also recommended the award of their first bronze medal to the Excelsior, not for its part in this contest, hut for the novelty of its principle, which is a valveless machine working expansively, aud out of which the mechanical judges hope to see further developmeuts.—*London Mining Journal.*

A Large Air Compressor.

The Plumas Eureka mine has in the course of erection a very large air compressor, to supply their increased demand for air power underground. This compressor was manufactured by the National Drill and Compressor Company, for their ageut, Edward A. Rix, Nos. 18 and 20 Fremont street, San Francisco. Next to the compressor at the Idaho mine, which is of the same make, it is the largest in the state. It is of the style called duplex, and consists of two long frames lying parallel with each other and about eight feet apart. On each frame is a 12″x15″ engine, which supplies the working power to compress the air in the air cylinders, which are fifteen inches diameter and thirty inches stroke, and holted to the same frame, directly in front of the steam cylinders. At the end of the frames, and joiuing them together, is the large shaft, having the cranks ou each end at right angles to each other. On the center of the shaft a six-ton fly-wheel gives equilibrium to all the movements. The usual water-cooling arrangements are attached to the air cylinders. This compressor is arranged to he driven with water power, also, and is accomplished hy haviug grooves on the rim of the fly-wheel to accommodate four two-inch hemp cables, which run over a pinion on the shaft of an eight-foot Knight water-wheel working under a 750-foot pressure. The compressor is so arranged that all the parts pertaining to the engine are simply disconnected, and the machine is ready to run hy water power without running auy of the steam gearing. This system of compressing air on the duplex system is coming into very general use, Mr. Rix having furnished quite a number of mines with these machines. The time has gone by when mine owners could neglect the cost of their wood-pile, and it now forms an importani item. The Duplex National Compressor, arranged with Meyers' cut-off on each steam cylinder, with the cranks at right angles, so that the right-hand steam cylinder drives the left-hand air cylinder, and vice versa, is claimed to be the most economical compressor yet made, and Mr. Rix says it is simply impossihle for any compressor driven hy a single engine, no matter how economical a valve-gearing it has, to compete with it in economy of fuel, taking into full consideration the amount of compressed air delivered. The machine is automatic. It maintaius a continuous pressure ou the air receiver, and slows itself down, stopping when the air is not being used. It will start itself instantly, after resting an hour or longer, the moment the consumption of air takes place. It requires no attention from the engineer heyond keeping the lubricating cups supplied, and keeping it clean. Mr. Rix will have another large duplex here shortly, and it is worth any mine owner's time and attention to examine the same. The smaller sizes he has in stock most all the time.

The Iron Mine.

The operations of the Iron Company at Hotaling are growing in importance, and are being conducted on a big scale. The number of men engaged at the furnace, mining out the ore, hurning charcoal, cutting timber, teaming, and in other ways connected with the business, number well up towards 300. Teams are constantly engaged in hauling pig iron to the railroad station at Clipper Gap, three and one-half miles distant, where hetween 7,000 and 8,000 tons are now piled up awaiting shipment. These huge piles of metal never fail to attract the attention of passengers on passing railroad trains, who, by this means, gain some idea of the importance of this new industry in the foothills. A survey of a new railroad route has heen made between Clipper Gap and Hotaling, hut whether the road is soon to he undertaken is not yet aunouuced; but that it will become a necessary adjunct to the business there is no douht. The company has recently hought large tracts of land from the Central Pacific Railroad Company, for the purpose of obtaining wood to hurn for charcoal, and has also hought a great deal of standing timber from the individual owners on hoth sides of Bear River. The consumption of timher for the kilns is enormous, all kinds being used in making charcoal, and in a few years the country around Hotaling for miles will be divested of its timher. The product of iron of the furnace is of a superior quality, and now has preference over any hrought to the Coast. The Central Pacific Railroad Company uses it quite extensively, taking regularly 200 tons a month for making car wheels and other work. It would seems as if at no distant day rolling mills will be established at Hotaling, and that it is not improhable that it will become a place of no little importance in the manufacture of iron ware.—*Placer Times.*

MECHANICAL PROGRESS.

American Mechanical Progress.

Some facts connected with the manufacture of wagons, carriages, agricultural implements, and tools, and machinery generally, in this country, says the *Blacksmith and Wheelwright*, exhibit in a very impressive form the vast progress which has been made in these industries during the last twenty-five years.

In 1860, a pleasure carriage of American make could not be found here. At that time we were obliged to import the springs and other steel work and most of the textile trimmings, but we now make the best quality of steel here, and also manufacture our own tassels, silks and fringes. It is said, that in the single state of Ohio we build in one year more pleasure carriages than are made in Great Britain and France combined. In 1880, there were in this country 43,000 establishments devoted to smithing and carriage-making, and the 105,000 hands employed in these workshops received in wages more than $38,000,000.

This remarkable progress is, of course, due chiefly to the skill and ingenuity of American mechanics and inventors, as shown not alone in the production of new labor-saving machinery, but also in making more effective certain tools common in most parts of the world, the heirlooms of ages, yet passing down to us through countless centuries, unchanged and unimproved, until American mechanics took them in hand. The result of this is that now, generally speaking, in durability, effectiveness and finish, American tools lead the world.

It was once supposed that no good cutlery could be made outside of Sheffield, but now, it is said that some of the manufacturers of that town endeavor to make their ware more salable by imitating the trademark of American makers. Our hand and circular saws are exported to all parts of the world, and in quality are not equaled by those of any other nation. In bronzed iron and brass articles, carpenters' and coopers' tools, molding and machine knives, tiles, etc., this country has nothing to fear from foreign competition.

Yet, this progress has been achieved in the face of formidable obstacles, chief among which may be mentioned the high price of labor and the raw materials. For years iron and steel have been sold here at rates enormously above those of other countries, and the consequence has been the handicapping of many of our most important industries. But these days have passed. Iron and steel are now much lower, and though the cheapening process has brought disaster to some of those who were interested in the production of these metals, there can be no doubt of the substantial advantage which will thus accrue to that much larger class of workers who fashion the raw material into articles of beauty or utility.

Styrian Tool Steel.

The iron ores of Styria are renowned for their purity, and are remarkable for the high percentage of manganese they contain. Hence the extraordinary character of the samples of Styrian tool steel which were shown at the late Engineering Exhibition by Messrs. Bohler & Bros., an Austrian firm, who exhibited a most interesting stand, where were several cases containing fractures of Styrian tool steel in ingots and bars; samples of the ores from which the steel is made; fractures of Styrian puddled and refined forge steel, and puddled and refined iron, all in fractures; also several samples of forged bar crucible steel. The fractures presented a beautiful silky appearance, and disclosed a remarkably fine quality of metal.

It may be interesting to notice the very simple method of manufacture adopted in Styria. The process was, in fact, illustrated at Messrs. Bohler's stand, where they had a full-size model of a Styrian refining hearth, as used at Hollbammer, Kapfenburg. In producing it the ore is melted in the usual manner, and run into cakes instead of pigs, that form being the most suitable for subsequent treatment. The cake or pig iron is then broken into pieces of a suitable size, and held by large tongs in the fire of the refinery forge, where it is brought down to a shapeless lump in the well of the forge. At this point of the process the Styrians claim to obtain a result that is nowhere else achieved, namely, that after the pig has run into the lump it is then refined steel, which is really shown to be the case by the direct method. This fact is due to the almost entire absence of any deleterious matter in the ore, to the high percentage of manganese it contains, and to the carbonization by the fuel, which we need hardly say is entirely charcoal. The lump is then cut into pieces, and drawn into rough bars under tilt hammers. The bars are then broken up into suitable lengths for melting in crucibles. When melted, the metal is run into ingots weighing from half a hundredweight to nearly half a ton each. The ingots are then heated and worked up into bars under tilt hammers, the result being a very high-class tool steel.

The Messrs. Bohler also produce a self-hardening steel, so called because it is naturally so hard that it does not require tempering. It is, in fact, a kind of natural steel, and possesses remarkable cutting power, combining, with its natural hardness, toughness and regularity of quality and temper. It is in use by some well known English firms, with extraordinary results. In one case it planed some switches and crossings the rails of which had defied all other brands of steel. In another instance one tool, made from 1¼-inch square self-hardening steel, bored out 300 steel tires, at a reduction in length by grinding of ¾ inch.

Temperature in Finishing Rails.

M. Gazan, a manufacturing engineer, referring to an opinion, expressed at a recent meeting of the Iron and Steel Institute, that "the chemical composition of steel has only a secondary influence upon the resistance of rails, every thing depending upon the temperature at which they are finished in the rolling mill," confirms this conclusion, and states from his own experience that bars which were finished at a bright-red heat (and which were recognizable after cooling by their blue tint) were more fragile under tests by striking or flexion than those finished at a lower temperature, which are covered in cooling by a layer of reddish oxide. In the first case the fracture presented a crystalloid and in the second an amorphous structure. It is his opinion that at a bright-red temperature the particles of iron have sufficient liberty of movement to allow of their grouping themselves into the crystalline form, which is not the case at lower temperatures, and that, consequently, if bright-red iron be subjected to mechanical work (such as forging and rolling) until it has cooled down it will have no opportunity of crystallizing.

In regard to the above the *Iron Age* remarks, that, while admitting the pernicious influence of overheating, it is hardly prepared to admit that the chemical composition of the steel has only a secondary influence upon the physical qualities of the product. There is no doubt that the best kind of steel may be ruined by burning or cold finishing, but certainly thus far no method of heating and rolling has yet been suggested by which as good rails could be made out of poor or unsuitable steel. As long as this is the case, it is idle to talk about chemical compositions being a secondary consideration. Quality of the ore, of the pig, of the spiegel—in a word, of each ingredient which enters into the composition of steel, are all determined by chemical analysis, and are selected with a view to the production, from the ratios of their constituents, of the material most suitable for the purpose for which it is designed. No doubt mechanical manipulation exerts a great influence, but this influence is, and always will be, secondary to chemical composition, until somebody shall succeed in making good steel from bad iron.

In regard to M. Gazan's temperature observations, *i. e.*, the points where the structure of the metal will change from the amorphous to the crystalloid, we must be permitted to say that his statement, while not lacking in precision, is decidedly incorrect. Unquestionably the change from the amorphous, wax-like structure to the crystalline (not crystalloid, but positively crystalline) is entirely dependent upon the temperature, but the degree of heat at which this change takes place is in inverse ratio to the carbon percentage; that is, the higher in carbon the lower the temperature at which the change will occur, and vice versa: and it is therefore that this change in iron corresponds to and is identical with the point of white heat, and not bright-red heat as M. Gazan claims to have observed. Heat observations in metallurgy require a very extended practice, and it is very probable that M. Gazan's otherwise valuable observations have been largely modified by defective vision.

DRIVING MACHINERY BY SAND.—An American paper gives an interesting account of the method recently adopted by Mr. J. Townsend, of Virginia City, to run a number of arrastras by sand. The arrastras are placed in a light sandy field, where only sufficient water for drinking purposes and to moisten the ore to be operated upon can be obtained. The sand drives a large overshot wheel, taking the place of water. It was at first Mr. Townsend's intention to run the arrastras by means of a large windmill, but as the speed was naturally irregular, he adopted the present method. The windmill now runs a belt containing a number of buckets, and these carry sand up to a large tank, somewhat in the way that grain elevators carry wheat. A stream of sand being let out upon the overshot wheel causes it to revolve, just as it would under the weight of a stream of water, and thus far the method is said to have been found very successful. When there is a considerable wind, sand is stored up for use when calms prevail, and in this manner the mills may run continuously.

IRON PAINT.—Iron paint, as it is termed—a paint composed of pulverized iron and linseed oil varnish—is a recent German invention, and is intended for covering damp walls, outer walls, and in short any place or vessel exposed to the action of the open air and to the weather. Should the article to be painted be exposed to frequent changes of temperature, linseed oil varnish and amber varnish are mixed with the paint intended for the first two coats, without the addition of any artificial drying medium. The first coat is applied rather thin, the second a little thicker, and the last in a rather fluid state. The paint is equally adapted as weather-proof coating for wood, stone and iron; nor is it necessary to previously free the latter from rust, grease, etc., a superficial cleaning being sufficient.

SCIENTIFIC PROGRESS.

An Unrecognized Possible Cause of Boiler Explosions.

M. Vignes, in the *Journal La France*, draws attention to experiments made as long ago as 1846, by Professor Donny, of Ghent, and intended to show the influence which air exercises on the boiling point of water, and on the character of its ebullition. In this experiment ordinary water is placed in a clean glass tube, open at one end, and boiled long enough to drive away not only the air above the surface of the water, but all the air dissolved in the water. Then, when the upper part of the tube is full of pure steam, the mouth is hermetically sealed, and the tube is left to cool. When cool, it is about half full of water, above which is vapor of water at a very low pressure. The tube being thus prepared, its lower end is plunged in a bath of glycerine or oil, which is gradually heated. No ebullition is visible in the tube when the temperature reaches 234° F. At 240° F., however, the column of water bursts, as it were, in two, with a sudden explosion, and part of it is flung against the sealed end with such force as often to break it open.

Now, in industrial works, it often happens that a boiler, having been filled with water, works for three or four hours without receiving a further supply. It may then be cooled down, and the next time it is wanted it may very probably be fired up again without starting the feed pump, the water level being judged sufficiently high. But the water in such a boiler will be in the same condition as that in the test tube; *e. i.*, it will be deprived of all air, and consist of water below and vapor above, the latter, however, being probably at a much higher pressure than that of the water in the tube. This water has no free surfaces in its interior, due to the presence of bubbles of air, from which evaporation can take place. Consequently, as in the test tube, there will be delay in vaporizing, at least until the expansion becomes great enough to overcome the pressure of the superincumbent vapor, and a sudden flashing into steam, which will be of the nature of an explosion, and may easily overcome the resistance of the boiler.

The pressure thus attained may be very great. In the test tube the pressure of the temperature of explosion, 240° F., will be 86 times what may be taken as the pressure of the superincumbent vapor in the boiler, as already observed. That pressure will probably be much higher, and the pressure of the explosion will probably be much higher also. To avoid this source of danger, it will be sufficient, as M. Vignes points out, to make it a rule always to feed a boiler when it is fired up after standing. This will have the double effect of lowering the pressure and of facilitating evaporation, by distributing the mass of water in the boiler and charging it to some extent with bubbles of air. Meanwhile the facts he has adduced are certainly sufficient to warrant a belief that we have here a key to many cases of boiler explosions which have hitherto been wrapped in mystery, and it seems very desirable that careful and precise experiments should be undertaken to prove or disprove the production, on a large scale, of the phenomena thus shown to exist in laboratory experiments.

Stone Implements.

In an essay upon the use of stone implements by ancient races, a German author submits some interesting observations to prove the existence of their use during the periods when metal began to come into use as a material for weapons and tools. Stone implements were employed by nations at a time when they were well acquainted with the preparation of the hard metals. Thus, the Egyptians used flint chisels and granite sledges in the quarries of Mt. Sinai. In the excavations at Syene stone tools have been found. The Romans used stone chisels in the gold mines of upper Egypt. The Assyrians at the zenith of their power used stone axes along with metallic weapons. The Chinese were armed with stone weapons when they (2200 B. C.) descended upon the plains and subjugated a race using metals. The Mexicans have wrought delicate sculptures on stone with stone implements. In the mines of Spain and Sardinia stone hammers were in use during historic times.

Many reasons explain these survivals. Conservative habits prolong the use of old and valued tools. Religious ceremonies connected with their use, as the acts of embalming among the Egyptians, circumcision with the Jews, sacrificial knives with the Phœnicians and Etruscans, maintained the employment of stone in such rites from traditional and reverent motives. Again, the poorer classes could not afford the purchase of the new and dearer implements, and used the older and cheaper material for the construction of their tools. The new metallic objects were probably not always able to replace in efficiency their stone counterparts. Workmen were more expert in the use of the stone than the metallic implements.

Again, linguistic evidence supports these conclusions. The Basque names for weapons and tools imply the use of stone; ax is a "big stone," hoe a "scraping stone," knife a "little stone," or "stone chip." The holy spear of India is named Akman; *i. e.*, "sling stone, thunderbolt." The god Thor is armed with a stone sledge. Our word "hammer" meant originally "stone, cliff," and later acquired the associated idea of "a stone to strike with." The German word *messer* originally meant *ess stein*; *i. e.*, "eating stone." *Hellebarte*, English halberd, meant "beard-shaped stone," stone ax. In the Indian and German myths, stone weapons take an important place; from which the author concludes that these peoples had reached the advanced stage of mental development implied in these legends and stories before their chiefs and heroes had replaced their stone with metal weapons.

On the other hand, the races of Southern Europe describe the heroes of their myths as fighting with metal armor only, which implies the origin of these tales at a time when the preparation of metal and the manufacture of metal weapons were understood. The same inference is drawn with regard to the Semito-Hamitic races. From these examples it is clear that the Stone Age with different races did not correspond to any identical and prevalent condition of culture, but varied, as might have been pre-supposed, according to the varied and opposite conditions by which they were surrounded. And it also plainly is seen that the Stone Age itself but slowly yielded before the encroachment of its modern successor.

A Self-Registering Ships' Compass.

Mr. Robert Pickwell, civil engineer, of Hull, England, has introduced an ingenious self-registering ships' compass invention capable of adaptation to every description of ships' compasses. It is at the same time so simple in construction, and supplies so infallible a check upon the movements of the man at the steering-wheel, that it can hardly fail, when it becomes generally known, to be regarded as an indispensable equipment to the safety of every seagoing vessel. Even if quartermasters and their subordinates, when directing the ship's course, may not be guilty of wanton carelessness, they are not always exempt from the risk of involuntary error in their reckoning. They may be overtaken in a fog, and a collision may occur. Although the captain himself may be a competent and experienced seaman, he may be navigating a coast to which he has previously been a stranger, or entering a foreign harbor by tortuous windings beset with shoals and quicksands, not very distinctly laid down in any chart, and both in a storm or in a calm he may have the misfortune to run ashore. The underwriters, by whom the ship is insured, and his owners, are alike interested in obtaining the most accurate information possible as to the position of the vessel's head at the moment of disaster. By no contrivance previously known has this much-desiderated information been attainable. But by the device of Mr. Pickwell, the direction taken may be indicated with unerring exactness at every moment throughout the entire voyage.

The arrangement is automatic. The length of time the ship has kept on any course is automatically photographed. Every alteration in the course, and the exact time when any change in the direction has taken place, are also registered to a nicety. The diagrams are accessible for reference at all times, and can be removed and filed every twenty-four hours, or oftener if desired. Each diagram is produced by a ray of either daylight or lamplight projected through an orifice in the compass-card to a prepared paper surface underneath.

DEPTH OF ICE DURING THE GLACIAL AGE.—Mr. G. W. Wright, in a communication to *Science*, says that the evidences of glaciation are distinct upon the Green Mountains to a height of nearly 5,000 feet. The lower summits of the White Mountains, like Carrigain, which is 4,300 feet above the sea, are covered with transported bowlders; and there can be little question that some found by Prof. Charles Hitchcock, within a few hundred feet of the summit of Mount Washington, were transported thither by glacial agency. Such is the evidence for New England. For the region north of Pennsylvania and the Ohio River, direct evidence of such a great depth of ice is naturally wanting; but, according to Ramsay, glacial scratches are numerous upon the summit of Catskill Mountains in New York, at an elevation of 2,850 feet above the sea. In southern Ohio there are numerous places where the ice, within a mile or two of its farthest extension, surmounted elevations which are about 500 feet higher than the plains to the north of them. I see no reason why it should not have been as deep over Lake Erie as over the region to the north of the White Mountains, though there are no glacio-meters like Mount Washington to measure the height of the frozen mass.

DETECTION OF WOOD FIBERS IN PAPER. As wood changes under the influence of the air, growing brown and consequently diminishing the durability of the paper in which it has been employed, it is of great importance, both for the dealer and for the consumer, to be able to ascertain whether a given sample of paper contains woody fibers or not. For this purpose a solution of sulphate of aniline, or a mixture of one part sulphuric acid and three parts nitric acid may be employed. Either of these solutions produces immediately a yellow color upon the paper if it contains wood, the depth of the yellow shade increasing as the proportion of wood increases.—*Chron. Industr.*

A GENTLEMAN who has passed a year and a half in the interior of Alaska, and has just returned, declares that the temper of the natives is such that there is certain to be a disastrous outbreak before many months, which will result in the massacre of the whites at the mining camps and stations. The power of the government he believes to be entirely inadequate to preserve order or control the natives so long as but one vessel is kept on that coast.

THE November peach is in market in Southern California.

Mining Share Market.

Transactions in the Mining Share Market of late have been on a very small scale indeed. The brokers are far from doing a thriving business, for what few dealers there are do very little dealing compared to what was formerly the case. Up on the Comstock the Ophir is extracting a considerable amount of low-grade ore from the 150 level. This is principally old fillings. Between the 150 and 500 levels it is expected that ore in new ground will be found. At the Hale and Norcross the east crosscut from the north drift on the 2700 level is developing some good ore, and the indications are of a promising character. The south drift on the same level is in vein material that promises well. At Gold Hill the leading companies are now taking out a considerable amount of low-grade ore from the old upper levels. The Alta folks will now soon be in a position to resume active prospecting operations.

Bullion Shipments.

Hanauer, October 30, $5,350; Stormont, 30, $2,900; Ontario, 30, $12,709; Horn Silver, 30, $12,000; Vienna, 30, $1,622; Alta, 31, $12,963; Horn Silver, 30, $12,100; Hanauer, Nov. 2, $4,345; Bullionville, 2, $2,562; Horn Silver, 2, $12,000; Vienna, 2, $1,745; Ontario, 2, $5,101; Horn Silver, 3, $12,000; Ontario, 3, $5,009; Alice, 4, $11,371; Crescent, 4, $2,020; Hanauer, 4, $4,860; Bullionville, 4, $2,676; Vienna, 4, $1,755; Ontario, 4, $4,760; Horn Silver, 4, $12,000; Alhambra, Oct. 29, $11,371; Contention Con. (for Sept.), $72,000; Bodie, 5, $10,709; Northern Belle, 29, $7,425; Standard, 29, $17,025; Contention, Nov. 2, $16,259; Mt. Diablo (for Oct.), $47,109.

A PROJECT is on foot to build three more railroads in this State, the survey for one having already been commenced. This one will be an extension of the road at present running from Marysville to Oroville. It will be extended from the latter town to Big Meadows, Plumas County. The second road will extend from Rocklin, on the Central Pacific railroad, to what is known as The Bridge, thence to Cooperstown Ravine, then through Greenwood and Georgetown to Forney's, thus opening up a large fruit district. The third projected route will extend from Napa to Berryessa Valley, from which Lake County is easily reached. This road is to be constructed so as to connect Berryessa Valley with Napa, thus giving it an outlet to the bay.

SULLIVAN'S PROSPECTING DRILL.—In the PRESS recently we illustrated and described the Sullivan prospecting drill lately introduced here by the Berry & Place Machine Co. We have heard since that one of these drills being worked for Mr. Osgood, of Denver, has got down a hole more than 1,000 feet, with the loss of but a single castor. He expects to go several hundred feet deeper. He has been using the same sized drill-tubing, and had no delays in any way from the machine.

THE United States Supreme Court has decided that self-killing by an insane person understanding the physical nature and consequences of his act, but not its moral aspect, is not death by suicide within the meaning of the condition in the policy of insurance upon his life; that the policy shall be void in case he should die by suicide.

MARQUIS TSENG says China is amply able to care for all Chinese interests, and China intends to fully do it. He thinks the danger of war is rapidly increasing.

IF YOU don't want to freeze when it's cold, suffer from excessive perspiration when it's warm, use Brown's Iron Bitters.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAMMOTH.—*Ledger*, Nov. 3: The Mammoth is 3 miles south of Jackson, at the southern extremity of the main quartz belt that runs through Amador County. There is but 1 shaft, which is less than 200 ft deep. From this a drift has been run north, which, after penetrating the footwall, encountered a body of quartz, which is not only of high-grade throughout but contains a vein of free gold, which has been followed 100 ft, and from which many thousands of dollars in gold have been taken. At another point a vein of metal was struck 50 ft from the surface. This seam varied from 3 inches to a foot in width. In less than a week between 2 and 3 tons of ore were taken out, which contained $75,000 in gold. This deposit was left unexhausted, on account of bad air. The work now consists in running a tunnel from the sidehill to tap the shaft below the present level. This tunnel is being pushed rapidly, and not more than 200 ft remains to reach underneath the shaft. Only 1 crushing of ore from the general ledge has been made, which yielded an average of over $100 per ton.

MIDDLE BAR TUNNEL.—The big tunnel at Middle Bar is now in over 200 ft. The water supply is sufficient to run the air compressor to its full capacity. Three shifts of 8 hours each keep the work moving. One body of quartz, several feet in width, has already been cut. The face of the tunnel is again in hard rock.

SUTTER CREEK.—*Sentinel*, Oct. 31: Alvinza Hayward is reported to have secured control of the Seaton mine of Drytown. Judge Moore and A. Caminetti are confident that in the Wetzler mine they have prospects of an enormous fortune. A small seam of quartz of some value was cut through in the Nevills' mine tunnel the other day. This is a foretaste of what may be struck before the tunnel, which is now in over 100 ft, reaches the ground under Jackson. A little less than $13,000 was the amount realized from a week's run of 5-stamps at the Iowa mine, and there is more in sight. The Zeile hoisting works are to be raised higher in the air, with the object of giving the mine-building more storage capacity. The 40 stamps of the mill have been running lately by steam. A number of men were set at work Monday repairing the Amador Con. mill.

Calaveras.

MURPHY'S.—Cor. of *Citizen*, Nov. 3, The Haggin mine, at Sheep Ranch, which has been worked for years, is still being worked successfully. One of the discharged employees informed me that he had an intimate knowledge of the lower levels of the mine, and in his opinion the mine never looked better than at present. The Calaveras, Washington and Wood mines all have merit. All the ore from them to the Oro Plata, which is in the immediate vicinity of Murphy's, are mining properties, that promise large returns. Nearly all the quartz in the mines mentioned is very similar to the quartz from the Haggin mine.

NOTES.—The Oro Plata Co.'s mill will start up again during the coming week. The one-stamper is running on ore from the Frazier mine. The rock is high grade.

SAN ANDREAS. The sinking of the shaft on the San Andreas gravel mine, which has been retarded on account of the workmen having had 40 ft of cemented gravel to contend with, is now being pushed ahead. During the forepart of the week a number of workmen have been moving the machinery from the old works to the new shaft. As yet they have not got down to "bed rock," but say "they are bound to strike it or dig out on the other side."

ANGELS' CAMP. *Mountain Echo*, Oct. 31: There has not been a time within the last fifteen years when the mining outlook in this section was more flattering than at present. Several quartz mills are ready to start, if water could be had, but are compelled to wait. Angels' will be a stirring camp in a few months.

El Dorado.

EUREKA. Georgetown *Gazette*, Nov. 2: The managers of the Eureka mine have decided to have a first-class 20-stamp mill put up on their mine, and have no more fooling with experiments. The work of putting up the new mill and machinery have been given to H. S. Morey, of the Placerville foundry. We learn that 10 stamps will be put in right away.

VOLCANOVILLE. From a clean-up of a few weeks run in the Flora (drift) gravel mine near Volcanoville, made a few days ago, over $3,000 was realized. This mine was purchased by Mr. R. G. Hart some 2 months ago.

STRIKE IN PLEASANT VALLEY. Placerville *Republican*, Nov. 1: Some very rich ore has been struck in the stope from the lower level in the mine, between $400 and $500 being obtained from the rock contained in 2 or 3 candle boxes.

ANOTHER GRAVEL MILL.—Capt. Ames has received part of the timbers for a gravel mill, which he intends to erect on his gravel claim on Chili ravine, near Coon Hollow.

THE DAVIDSON MINE.—Under the management of Peter Gross this mine continues to improve. Last Saturday they cleaned up over $8,000, having run 10 stamps for 25 days.

Inyo.

CLIFF MINE.—*Independent*, Oct. 27: We have specimens of silver ore from the Cliff mine, Deep Spring district, which assays $755 per ton, and which works to a little over $650 on an average. The vein is continuous, carrying not less than a 6-inch streak of just this kind of ore. The Cliff is the property of Messrs. Greenly and Broder. This is on Cottonwood Creek, not in Deep Spring proper, though covered by that district.

THE WAY TO DO IT.—The best method for reducing Inyo County ores is yet an unsolved problem. It may be set down as a settled fact that ordinary "free milling processes" won't do. More elaborate and expensive processes are not to be relied upon, except in exceptional instances. In the main, smelting is to do it. But most of our ores can not be handled in quantities in that way. We feel assured this question will be settled here, as it has been in Colorado and Montana. In the main, their plan is comprised in simply this: Concentrating and smelting. Special concentrating mills for custom work are becoming more and more common. They use crushers, not stamps, of great capacity, and concentrators, each of not less than 20 tons daily output, working to above 90 per cent of all minerals contained.

Mariposa.

BUENA VISTA. *Herald*, Nov. 2: Twenty-five ft from the surface a drift has been run east 105 ft on the vein, which shows a healthy body of ore. From the middle of this drift a *Herald* representative knocked off a piece of rock last Friday that showed considerable gold. A drift will be run east on the vein this winter at the 80-level, and sinking resumed in the shaft. Four miners are now at work. About 300 tons of ore that will probably work $15 to the ton is now on the dump.

MT. RAYMOND.—Messrs. Smith and Gann bonded the Willoughby mine to San Pedro until August, 1884, for $20,000, with the proviso that if the money is paid by the 1st day of January, 1884, they would accept $12,000 as payment in full for the mine. San Pedro is confident that he will pay for the mine on the 1st of January.

DILTZ MINE.—*Gazette*, Oct. 27: There is already upon the dumps, and in sight in the new shaft, milling ore that will yield at the lowest estimate $150,000.

Placer.

FOREST HILL.—*Argus*, Nov. 1: The upper part of the Forest Hill divide will be a lively mining region next year, judging by the accounts we hear, not only of the big prospects, but of the big pay in the new mines. Mining matters seem booming. The Mayflower Co. are making extensive improvements on their claim. They have just completed fine hoisting works, and are commencing a stamp-mill.

BATH.—*Herald*, Nov. 3: Breece & Wheeler, who for awhile lost the channel in their mine at Bath, have struck it again, and are now taking out pay as big as ever. All over the Forest Hill and Iowa Hill divides the mining outlook seems better than it has for years.

GOLDEN FLEECE.—We received a call Tuesday from Mr. Frederick Shermeir, of San Francisco, and E. Mortensen, of El Dorado. They were on their way to the Golden Fleece gravel mine, above Damascus, in this county. News had been sent to them that the main channel had been struck, and that the gravel paid well. These gentlemen informed us that pay had also been struck in the Hog's Back and the New Basil, other locations in the same neighborhood, which, like the Golden Fleece, have been boring into the earth for years in the expectation of striking the big blue-gravel channel.

Plumas.

GRANITE BASIN.—Greenville *Bulletin*, Oct. 31: The quartz mill of the Williams mine, at Granite Basin, has been moved up to the mouth of the tunnel at the mine. The ore had to be hauled over a bad road. Now the ore can be delivered in the mill direct from the mine, and steam power will permit of running at all seasons. There is an immense amount of ore in sight in the basin.

THE LOST LEAD.—When the rich lead of the Providence Hill gravel mine was lost effort was made to recover the lead, but without success. A few months ago John Ellis and Charley Bressler went to work, and are now very confident that they are on the right track. Should they be successful the activity of former days would soon be resumed along Rush creek.

EMERALD MINE.—Greenville *Bulletin:* The corporation is known as the Lucky S Gold Mining Co. Both the finds were on Saturday—hence the name Lucky S. The company own 1500 ft on ledge No. 1 and 3000 on No. 2, and its twin, the black ledge. Every practical quartz operator expressed the opinion that the two ledges will ultimately be found together and the walls filled with solid quartz. If such should prove to be the case, here is a show for the biggest and richest mine in Northern Plumas. A superficial cut has been made on the vein, 500 ft south of the shaft, exposing rock that a well known mining superintendent says will pay $100 to the ton.

San Bernardino.

ROCK POINT. Calico *Print*, Nov. 3: Operations have been resumed in this mine. A tunnel 165 ft in length has been driven in from the east side, running in the direction of the Silver King. Some of the ore will go $150 to the ton, but most is low-grade, averaging $40 to $50.

KEARSARGE.—A larger body of ore is in sight than there was a week ago. Within a width of a few feet several streaks varying from 3 inches to a foot can be traced in the sides and face of the opening. Besides the amount of dead work done they have taken out 1,000 pounds of very rich ore.

SAM HOUSTON, No. 2.—Messrs. Burch & Hutchins have leased the Sam Houston No. 2, and have indications of a fine mine. They have sunk a shaft 40 ft, and run a drift on the ledge to the north. In this drift they have uncovered a vein of ore a foot in width that is getting wider as they go down. Some very rich ore has been taken out; about a ton that is supposed by assays to be worth over $1,000.

Shasta.

SOUTH FORK.—Cor. *Courier*, Nov. 3: Shirland & Henneken have been extending the Continental tunnel and found some ore. Cooper & Smith are at work on their mine, and will start their arastra in a few days. E. L. Ballou's arastra is running on ore from his Manzanita mine. The mine is looking well. Crum's arastra is running on Pacific ore, very rich. Wright & Ormsby have their arastra completed and at work. The arastra has several improvements over the first constructed here. Some assessment work is being done on the Chicago, is extending the the working tunnel. Blank continues to turn out good work. Robinson & Co. have increased their pressure by adding more pipe. The last run averaged $24 a ton. The mine is looking well.

Sierra.

COLUMBO.—*Tribune*, Nov. 1: Everything is activity around the Columbo mine at Sierra City. Notwithstanding the short time since active operations were begun, a vast amount of work has been accomplished. The mill is well along toward, completion. J. P. Deidesheimer is personally supervising the work.

MARGUERITE.—At the Marguerite mine, men are grading for a flume and excavating a tail-race for a turbine water wheel. The flume will be about one-quarter of a mile long. The wheel will be used for running the hoisting machinery. Power will be transmitted from the wheel to the hoisting works by means of a wire cable. The distance between the 2 is 1,200 ft.

RUBY GRAVEL MINE. *Messenger*, Oct. 27: In 2 weeks arrangements will be completed for taking out pay gravel. There are 6 ft of pipe clay between the gravel and sediment in the deep channel. Sediment extends 116 ft above and Supt. Colman figures its width there at 1,000 ft. The gold from the deep channel has been assayed in San Francisco, and found to be .907 fine, better than that of Rock creek in early times. Gold from the other Ruby channels assayed .875. About $4,000 worth of timbers are laid in for winter. The Ruby lies midway between the Miocene and Forest City.

BALD MOUNTAIN EXTENSION. At the Bald Mt. Extention, Forest City, there are 30 cars, used in the main tunnel, and 6 buggies, tipping gravel into the chutes, 50 men employed. The gravel ahead, far as tested, prospects richly. The clean-up last Sunday, was 80 ounces.

Tuolumne

BUCHANAN.—Sonora *Democrat*, Nov. 3. Work at the Buchanan mine is principally confined to sinking. The shaft is down 265 ft, with a ledge over 7 ft wide, all fine quartz, in the bottom. The law suit between the company and Mrs. Francisco has been compromised.

NEVADA.

Washoe District.

UNION CON.—*Enterprise*, Nov. 3: The joint Sierra Nevada winze is now about completed to the bottom of the dump below the 3100 level, and the first of next week the cutting out of a station will be commenced. The bottom still continues to show quartz that is rich in gold.

COMBINATION SHAFT.—The station for the new hydraulic pump is completed, and they are now putting in the foundation on which the machinery will be set up.

GOULD AND CURRY.—The new winze is east cross-cut No. 1, on the 2500 level, joint with Best and Belcher, is down about 30 ft. It will be sunk to the 2700 level, provided too much water shall not be encountered. Thus far the indications are that the winze will not touch the wet section, which proved so annoying in the drifts on the 2500 level.

HALE AND NORCROSS.—The south drift on the 2700 level has been turned to the west, and is cutting vein material of a promising character. The east cross-cut from the north drift on the same level is finding some good ore. The indications at this point are better than any found on the 2600 level.

UTAH.—The west wall having been found in west cross-cut No. 2, on the 1350 level, east cross-cut No. 2, just opposite, has been started. Lying against the west wall was about 10 ft of quartz, clay and porphyry.

ALTA.—The 2150 level is now about drained. As soon as the water is out of the drifts the work of cleaning out and repairing may be commenced, and then active prospecting will be in order.

BEST AND BELCHER.—Good progress is making in the joint Gould and Curry winze, just started in east cross-cut No. 1, on the 2500 level. It was yesterday down about 30 ft. It will be sunk to the 2700 level.

IMPERIAL.—The west drift from the 600 station is being rapidly advanced. It will be pushed out into the old upper workings, where it is expected that a good deal of low-grade ore will be found.

CROWN POINT.—The amount of ore extracted is gradually being increased. The mills on the river will soon be running to their full capacity, when a full force of miners can be put to work.

MEXICAN.—On the 2900 level have completed opening and making connection with the 2700 level. On the 3160 level the main north drift has been extended about 30 ft during the past week.

YELLOW JACKET.—A good deal of ore is now being extracted, and the amount is gradually being increased. Much ore has been developed at various points and can be taken out as wanted.

OPHIR.—Are taking out a considerable amount of low-grade ore from the 150 level. This is principally in the shape of filling that was packed away in the old openings some years ago.

SIERRA NEVADA. On the 2900 level are cutting out a station for a raise which will be carried up to the 2700 level.

CALIFORNIA.—Have completed repairing the joint Con. Virginia winze on the 2500 level, and have resumed sinking the joint Con. Virginia winze on the 2700 level.

ANDES.—Are still extracting some ore from the north drift. The drifts from the winze show some fine-looking quartz.

CON. VIRGINIA.—Have completed repairing the joint California winze on the 2500 level, and have resumed sinking the joint California winze on the 2700 level.

BENTON.—The draining of the Alta also drains this mine. As the water will now soon be out, prospecting can again be proceeded with.

BELCHER.—Not much is as yet being done in the way of extracting ore, as the mills on the Carson river can run but a few stamps.

OVERMAN.—Some low-grade ore is still being extracted from the old upper levels.

UNION SHAFT.—Are still easing timbers at the 2300 station.

Esmeralda District

A NEW FIND.—*Herald*, Nov, 3: On last Sunday A. L. Moore, found and located a magnificent ledge of very rich galena. The mine is 1 mile northwest of the Mexican camp. Mr. Moore has deeded 735 ft of the new find to Antone Costello. The mine is known as the Silver Wave. On the same day, Fredrick Smyth located an extension of the same. The parties are sanguine that they have the richest find in the district.

Belmont District.

BELMONT MINE.—*Courier*, Oct. 27: The mill and leaching works of the Belmont Mining Co. are now completed. The engine and boilers in the mill have been thoroughly overhauled and refitted and are as good as new. The following is a copy of the Superintendent's letter of October 27: Stopes in south tunnel are opened and yielding very high-grade ore in satisfactory quantities. No. 1 level in Laity ground advanced 12 ft during the week, developing a five foot stringer of ore at its junction with main ledge. This ground promises to be a bonanza. Started the mill this morning. Will take a day or two before we work to the full capacity.

Humboldt District.

A NEW CAMP.—Cor. of Eureka *Sentinel*, Nov. 4: "I have been to many new camps, as well as old camps, but I have never seen any to compare with Willow Creek in the number of large and well defined ledges, and, for what little work there has been done on them, the large amount of very rich ore developed. The deepest workings in the camp are not over 20 ft down. There are hundreds of the finest looking prospect lying around in every direction. There has been good deal of placer mining done in years past at the lower end of the canyon, and paid well, but owing to the bedrock being very deep and the country at that point flat, the white men abandoned the mines; but higher up the creek the canyon becomes narrower and steeper and the drainage much better, and I am positive from what prospecting I have done, that there are many places along the creek that will pay well in gold. Yesterday I was out prospecting for placers, and I found very encouraging prospects in coarse gold. Willow Creek Station, on the Idaho stage road, is situated just at the mouth of the canyon formed by Willow Creek, and is 55 miles due north from Winnemucca, the nearest station on the Central Pacific railroad."

Paradise District.

WILD GOOSE.—*Silver State*, Oct. 29: A report has reached us from Spring City that J. V. McCurdy has struck some very rich ore bodies within a week in the Wild Goose mine. On the 30th, 1 bar of bullion, valued at $2,348.33, was received at Wells, Fargo & Co.'s office here, from the Paradise Valley mill.

ARIZONA.

TURKEY CREEK.—Prescott *Courier*, Oct. 29: Charley Gallagher has discovered a mine in Pine Flat which is said to be as rich as the Pine Spring mine. The vein, which is large and well defined, is rich in chloride and carbonate. Chunks of horn-silver, similar to that of the Pine Spring mine, are being taken out of the new bonanza. The owners of the claim are Charley Gallagher, Tom Roach and Norman McLeod. The Union is looking fine, and tons of high-grade ore on the dumps. Practical mining men pronounce it the best in the district.

UNITED VERDE.—Prescott *Courier*, Oct. 31: The United Verde Copper Co. declares a dividend to-day, in New York City, of $37,500, being declared on the profits accruing up to Oct. 1st. Operations on the road to the mine have cost this company $31,000; arrangements for the bringing of the water to the same costing them $11,000; and the furnace plant and buildings, etc., have been paid for out of the proceeds of the one 30-ton smelter up to Oct. 1st.

SILVER MOUNTAIN.—A force of men are at work on the Mammoth mine. As it is a perfect mountain of ore, the men do not mine, they merely quarry. Some specimens recently seen by us are good to look at. The quartz is close-grained of beautiful colors and rich in metal.

GOLDEN RULE.—Tombstone *Epitaph*, Oct. 28: Very little stoping has been done on the Golden Rule, for the mine has been developed in such splendid shape that it has produced ore enough from shafts and drifts to keep the ore teams busy and mill running. The drifts from the bottom of the working shaft will have, by the time it is in as far as the drift on the first level, increased the value of the mine in tons of ore 8,000, and in money value $480,000. The actual value of all ore in sight in the mine is, tons 26,000, and the value $1,500,000, and 800 tons at the mill.

COLORADO.

CASCADE.—Idaho Springs *Gazette*, Oct. 27: The Eureka lode in Cascade district is improving. An entire change of rock has taken place, and at the present distance of 87 ft in the adit, 2 ft of highly mineralized quartz can be seen. Specimens of the solid ore assayed as high as $1,700 per ton.

HARDSCRABBLE.—Georgetown *Courier*, Oct. 25: This property includes the Avalanche, Hardscrabble, Dixey, Miner Girl and Lucinda mines. The present developments consist of an adit level run on the Hardscrabble lode 362 ft in length. On the Avalanche is a shaft 50 ft in depth, sunk from surface, disclosing a 6-foot crevice with good pay ore. Runs of the ore ranged from 400 to 600 ounces silver per ton. The main drift is 100 ft in length, all in good ore. The ore is known at the Shivcly mine as "coin rock."

NOTES.—The Seven-thirty mine continues to ship her full complement of ore. The last mill run amounted to $1,004.81. The first-class ran 631 ozs. silver per ton, and 37 per cent lead. The Pay Rock concentrator, at Silver Plume, is kept running steadily day and night on the dump material of the Pay Rock mine. It has so far proved a grand success. The Garfield lode is looking well. The tunnel on the vein is 67 ft in length. A streak of quartz, galena and sulphurets, 2 inches thick, has been struck. In No. 6 level on the Pelcan Dives lode a force of miners is now drifting west. They have from 1 to 3 ft of mineral, that ranges about 35 ozs. per ton silver, and 40 per cent lead. This property is shipping 100 tons of ore per month. John Halls & Co., who are drifting east from the 80-foot shaft on the No. 3 tunnel on the Baker, report the mine in good shape. The crevice is 12 ft between walls. The first-class ore runs 230 ounces silver per ton. The streak measures 3 to 4 inches in width. T. W. Cunningham, from Decatur, informs us of another important strike in the Horseshoe district, in the Queen of the West group. In the 135-foot drift, four inches of green and blue carbonate of copper with galena has been encountered. This property will be worked all winter.

IDAHO.

STAR.—Wood River *Times*, Oct. 26: The new strike made in the Star mine, in Star gulch, within 2 miles of Hailey, consists of 3 streaks of ore. One of these is 4 inches wide, of gray copper and galena, which assays over 1,000 ounces silver per ton. This was found just about where the Salt Lakers who bonded the mine last summer got disgusted and quit work. The drift is in 20 ft on the new field, which seems to improve as run upon. There are 16 men working, and by next week Mr. Wolters, the superintendent, will have 12 of them working in ore. He intends next month to make an unusually heavy run, before the bad roads begin, and will extract at least 100 tons, that will sell for $175 to $200 per ton.

FISHER.—Ketchum *Keystone*, Oct. 24: The Fisher mine and mill, in what is known as the Pig Tail district, 18 miles east of Sawtooth City, has been bonded to Col. W. H. Broadhead. The Fisher is purely a gold mine, there being no traces of silver in the rock, and it is remarkable as being the solitary gold ledge of the Sawtooth and Salmon country in that part. The lode has been demonstrated by shafts and a 300-ft tunnel to contain an ore shoot 500 ft in length. The average width of pay vein is 12 to 15 inches, and the lowest grade produces $40 per ton in gold. The lode has been located a distance of 4500 feet.

SAWTOOTH.—The Columbia & Beaver mill continues to run on Silver King ores, and now, since fully under headway, turns out a bar daily, valued at a little over $1,000. It is estimated that the total product for a 60 days' run, to November 10th, will amount to $60,000 in the bar. The mill will run till that date, when operations will discontinue till spring.

MINERAL DISTRICT.—The *Keystone* credits the following items to the Weiser *Leader*: The Black Hawk has 4 men at work. The Daniel Boone are down about 40 ft. The rock assays 400 ounces silver, with a trace of gold. The tunnel is in about 100 ft. The Black Maria, owned by Boggs & Landy, is progressing, the incline being down about 100 ft. They will crosscut each way. Recent assays show that the ore goes 80 ounces silver—$103 45 per ton—$2 in gold. Egan mine, owned by George Huffman. Tunnel in 25 ft. Has assays that go 400 ounces, and will average 50 ounces. Lady Bank, owned by George W. Maxwell, has a tunnel in 90 ft—copper in various forms, and large percentage in silver. Last Chance has a tunnel of about 65 ft. Assays show 14 per cent copper, and rich in silver.

MORE CREEK.—Idaho City *World*, Oct. 23: F. Hayden is preparing to put a bedrock flume in More creek, to commence at the gap a short distance below the Warm Springs, and run up half a mile, for the purpose of working ground—a bar—that is now covered with tailings. The flume is to be 40 inches wide and 5 ft deep.

NEW MEXICO.

BULLION MINE.—Southwest *Sentinel*, Oct. 24: The claim is upon a contact of lime and porphyry, and the main ore workings are in lime, from the surface down. The depth now attained is 115 ft, and the ore throughout has shown up in the shape of pipe veins rather than deposits, being of all grades, and some small bodies running as high in assay as 29,000 ounces to the ton. We saw specimens of wire-silver from this mine which were of wonderful beauty and almost fabulous value. The ore is a sulphuret, and the shipments of selected are about 30,000 pounds per week, which is safe to run between 200 and 300 ounces to the ton. The consignee is the Colorado Sampling Co., of Denver, who handle the ore, sample it thoroughly, and sell in open market to the highest bidder. The demand for rich ores from New Mexico is growing, and returns upon shipments show a steady improvement.

SUPERIOR.—The aggregate shipments reach 22 car-loads, being a little less than 300 tons, and the product in money figures is about $60,000 for the past 5 months, the first car-load having been shipped in May. Shipments are regular, at the rate above indicated. There are upon the dump some 700 tons of lower grade ore, which will be utilized as opportunity offers.

IRON KING.—In the first level, 35 ft below the surface, Mr. Welch has recently opened what he calls his diamond mine. It is some 150 ft from the mouth of the drift, and in truth, the uninitiated coming suddenly into the chamber would be dazzled by the display. The opening is 10 ft by 12, and perhaps 10 ft in height. Each and every square inch of the surface, including roof and floor, is a glittering mass of fine galena ore, the flakes or crystals ranging in size from a pin's point to a half dime, and as bright and glistening under the rays of the candles as so many veritable diamonds. How far this chamber will extend is a matter of conjecture. The ore is of a decomposed character, very readily worked, and is safe to run 100 ounces to the ton. It is in connection with this property that a smelter is being erected at Kingston. Excavations for foundations have been commenced, and the 1st of December will see the entire plant on the ground. It includes a 70-ton smelter, such as are in use at Leadville, and the works will be of such capacity as to run 3 of these.

BULLARD PEAK.—Silver City *Enterprise*, Oct. 26: A sale of importance took place on Wednesday, in which 4 claims, the Butter-nut, Pumpkin, Stonewall and Neptune, in the Bullard Peak district, were transferred by the locators, James Sullivan, John Mullen and John Black, to Deurich Schule, of St. Paul, Minn., the price paid being $5,000 cash. The claims have fallen into hands that will immediately set in to develop the property.

MONTANA.

POLLOCK.—*Inter-Mountain*, Oct. 26: The Pollock is the name of a prospect owned by W. A. and J. K. Clark. The claim contains two distinct veins. On the northern vein a shaft now 30 ft deep is being sunk, on a very well defined streak of ore which samples 80 ounces per ton. East of the shaft a tunnel is being run in on the vein, and has attained a length of 150 ft. Its face is now 50 ft from the point where it will interseet the line of the shaft. It contains considerable ruby silver. The shaft on the south vein is 40 ft deep, and shows all the way down a remarkably rich streak of ore, of a uniform width of 3 ft and sampling over $100. It makes the best showing of any prospect in the district.

POSER.—From A. W. Barnard it is learned to-day that the development of the Poser continues with encouraging results. The total length of the lower level is now 150 ft, and drifting is in progress both east and west on an ore breast which varies in width from 9 to 15 ft. Only a small force of men is employed, but owing to the ease with which the ore can be mined the daily product averages 20 tons, which pulps in the Silver Bow mill about $35.

COLUSA.—A private letter just received at this office, from London, states that the negotiations for the sale of the Colusa mine and plant to English capitalists have been almost concluded. The price, if the sale goes, is understood to be $1,500,000, which is considered low by those who understand the immense productive resources of the mine.

ALICE.—*Inter-Mountain*, Oct. 27: At a depth of 300 ft a cross-cut was extended to the south vein. From the face of this cross-cut drifts east have been extended for 100 ft and the ore-showing is a grand one. The quartz has an average width of 4 ft, and is richer than any ore taken from the Alice for the past 4 years. Mr. Hall states that the south vein product samples from 150 to 200 ounces, and that the supply is continuous and reliable. It is a fine-grained, black sulphuret, easy to mill, and largely mixed with native silver. On the 200 level some good ore is also being extracted. The Alice is now producing 60 cars of ore daily, and Mr. Hall states that he could easily supply the 2 mills from that property alone.

OREGON.

WASHINGTON DISTRICT.—Cor. Bedrock *Democrat*, Oct. 24: Work is progressing finely. The Black Maria is down 91 ft and shows a fine body of ore. Some of the assays go as high as 311 ounces per ton, making $402 per ton. The Egan is a fine prospect, showing a body of ore 10 ft in diameter. The tunnel is in 30 ft. The Daniel Boone is a fine looking mine. The incline is down 32 ft. Some of the ore goes as high as 500 ounces per ton. The Atlanta and the Idaho, on the south of the Daniel Boone, are good prospects. On the east of the Boone are the Lady Jane Gray and the Martha Washington. The owners of these mines, owing to the lack of capital, have not done much to develop them. John Morrison, of Weiser, has bought the True Blue, an extension of the Black Maria. We are bound to have one of the best mining camps in Idaho. I have been here 2 years and never lost faith in it. I think that ore that goes 500 ounces of silver to the ton is a pretty good thing. There are about 40 miners here and most of these will winter here.

JOSEPHINE COUNTY.—Jacksonville *Times*, Oct. 26: Miners of Josephine county are generally ready for the next season. Geo. Livingston, Supt. of Bybee & Co.'s claim near Waldo, is putting the same in first-class order. N. De Lamater is fitting up his mining claims near Kerbyville. Frank Ennis is engaged with Geo. Simmons of Waldo is opening some extensive placer claims. The cutting of a large tunnel has been commenced.

UTAH.

PREUSS DISTRICT.—Southern Utah *Times*, Oct. 27: The first location starting from the south is the Lynn Payne, owned by R. V. Tone, who has sunk an incline shaft 60 ft, and drifted 20 ft towards the hanging wall, through soft low-grade ore, which has yielded assays from 5 to 30 ounces of silver per ton. Next, on the north, is the Morning Star. But little has been done on this property, notwithstanding the croppings are very large and show well in both gold and silver. Between this location and the Tiptop there is 2 miles of unlocated ground. Considerable work has been done on the Tiptop. * * * * * The Mountain Queen is too well known to need description, and will soon again talk for herself. The Silver Hill is next, and shows up a 4-ft vein, carrying gold, silver and lead ores.

CAVE MINE.—Last Wednesday a party of Friscoites drove over to Bradshaw camp and visited the wonderful Cave mine, one of the group owned by the Frisco M. & S. Co. The new ore chamber had just been broken into. The extent of the ore body could not be calculated, but its average thickness as far as it could be followed was 10 ft. The ore is a carbonate of lead, of an assay value of 55 ounces silver, 2½ ounces gold and 48 per cent lead to the ton. The mine, or rather the Cave group of mines, is a series of caves connected by system of tunnels, drifts and chutes, and it is reasonable to presume that the astonishing developments will cause the company to erect smelting works ere long and increase the daily output to 75 or 100 tons.

WASHINGTON.

COEUR D'ALENE.—Wood River *Times*, Oct 24: Thos. Bentley, the well known prospector, got in yesterday morning from the Coeur d'Alene mines. He came to make arrangements to go back there soon, to remain all winter. The Coeur d'Alene country, Mr. Bentley says, is not shown to be as rich as has been reported; but is as yet too new to justify any positive expression of opinion as to its merits. It is situated in the Coeur d'Alene mountains, about 200 miles northwesterly from Butte, Montana, 25 miles north of the Northern Pacific railway and 60 from the Canadian frontier. The placers pay from nothing to $100 a day. The quartz ledges are not yet worked. The region is of unknown extent, and for aught that is known to the contrary may extend to the north pole. Roads and trails are being made in the Coeur d'Alene mountains, and it is probable that travel in and out will be kept up all winter. But there will not be much to do before next spring for those who have not already located claims. There were about 1,000 persons there 10 days ago, and others were crowding in from every direction, but the rush is expected next spring. The country is taken up for miles. Mr. Bentley has an interest in a placer claim and owns 2 quartz claims.

ANOTHER.—*Inter-Mountain*, Oct. 29: Barney Roundabush is going back to the Coeur d'Alene just as soon as he can get his provisions packed. He says "there is one gulch which undoubtedly contains gold in paying quantities for a length of 12 or 14 miles. Every foot of it is taken up. Each claim contains 20 acres. Bedrock in the bottom of the gulch has not yet been struck, though we are running a drain for it. The gold so far discovered comes from the rim rock. Some of the ground pans from $1 to $5 per pan, but of course it does not abound everywhere, though only small sections of ground at different places have been prospected. From results so far achieved it is quite evident that what ground has been worked is far richer than the Alder gulch diggings in '62, '63 and '64 which averaged only 5 cents to the pan. I was there during the finish times."

Scientific Mining in Europe.

Before the Department of Mining Engineering in Yorkshire College, recently, Mr. Arnold Lupton, instructor, gave a brief account of some of the points of interest noted by him in a recent inspection of mines and mining schools in Belgium, Westphalia, Hartz Mountains, Saxony, Silesia, Hungary, etc. The lecturer stated, that whilst in England the art of coal mining had reached a high degree of excellence, on the Continent there was a higher average of excellence in all those operations where scientific training was required, and the number of those operations was greater than was sometimes supposed. As instances, he mentioned that in England the speed and economy of the production of coal was perhaps greater than on the Continent. On the other band, the method of sinking shafts through subterranean lakes of water to dry ground below—an operation impossible by the ordinary method—was the great invention of a German and a Belgian engineer. At the present time, at continental mines, there was much greater economy in the use of fuel for the production of steam power. As a general rule, no smoke—that extravagant and unnecessary curse of English mining and manufacturing districts—was made, and steam was always used expansively. Electricity was used for underground lighting, shot-firing, signaling, and transmission of power, and the high education of officials made it quite easy for them to establish and use any new invention.

The lecturer described some of the large water-pressure pumping engines in use in the Hartz Mountains. These engines were nearly 700 yards below the surface, and were worked with the natural pressure of water due to the difference in the height of the reservoir of collected rainfall on the surface and the off-take level, seven miles in length and 1,300 feet below the pit top. At Zankcroda, near Dresden, there is a colliery where underground haulage is done by means of an electrical locomotive. This has now been at work for more than one year, and gives satisfaction. The lecturer had traveled on this locomotive, which received its power from a little steam engine and dynamo on the surface. The machine was the size of a little pony, and it did the work of five large horses. The apparatus is exceedingly easy of construction and moderate in first cost, and these qualities recommend its adoption in many cases. After referring to other points of interest, the lecturer alluded to the mining schools established or subsidized by government at Liege, Clausthal, Freiberg and Schemnitz, all of which he had seen. As an humble representative of the Yorkshire College, he had been received with the utmost courtesy, and all the mines and schools where he had been were thrown open to his inspection, and every information afforded. At the lead mines of Meternich, the largest in the world, there was a stratum of sandstone containing galena, sixty yards thick. The bottom bed only is worked, twenty yards in thickness. It is worked on the pillar and stall system, and great chambers are excavated twenty yards high, thirty yards wide, and forty yards to sixty yards in length. These are illuminated by the electric light; and the lecturer had an opportunity of taking a photograph of some of the officials and workmen. Another illustration of the use of electricity in mines on the Continent is the method of signaling in a deep mine near Freiberg in Saxony. There a copper conductor is carried down the shaft, and by means of a specially contrived apparatus a signal can be given for the cage whilst it is in motion, so that a man traveling up and down the shaft can stop the cage at any place he desires, by striking a rapper which is on the cage. In Upper Silesia a seam of coal is worked twenty-four feet in thickness. The coal is of excellent quality, and is used in the large iron works adjoining. Ten million tons of coal are annually raised in this locality. The mine is worked in a very scientific and careful manner. Timber trees, twenty-four feet in length, are used to support the roof, and cross-bars going from tree to tree prevent any material falling which may cause danger to life or limb. The mode of working is so systematic that not more than ten per cent of the entire seam is left in the mine, and it was impossible to visit the mine without thinking that in some respects English managers of thick-seam coal mines have something to learn.

The chairman, in submitting the vote of thanks, said that it was some reflection on the mining interest of Yorkshire that the chair of mining engineering was supported by the Drapers' Company of London, to whose generosity they were indebted for the existence of the chair, and thought the mining interest should still further supplement the endowment so as to provide the instruction with more apparatus. He fully agreed with the statements contained in the able and interesting lecture to which they had listened, and the College was to be congratulated on its professor of mining engineering; he had himself visited many of the Continental mining districts, and could speak of the high class of education there obtained by all the officials, and he thought all the officials at English collieries ought to be educated so as to know the relation between cause and effect. It was not that they were all to be made mining engineers, because that might involve a still higher grade of education, but all ought to have a theoretical training to explain and guide their practical experience. He thought that in large collieries England could show some examples that were unequaled in the world, but in metal mining, undoubtedly, his experience was the same as that of the lecturer, that on the Continent the average of practice was superior to English, and the remedy was to be found in the instruction now given by such institutions as the Yorkshire College.

Breakage of Hoisting Ropes.

In the Minutes of Proceedings of the Institution of Civil Engineers, Vol. LXXIII., just issued, at page 447, is an abstract of a paper by Franz Peters, on the "Breakage of a Wire Rope at the Duke Hardenburg Colliery, Westphalia." It will be interesting to peruse the abstract in question:

"On Dec. 21, 1882, a winding rope broke at the Duke Hardenberg Colliery, Westphalia, whilst raising to the surface 25 men, who lost their lives. The rope was of cast steel, and made at the works of C. L. Neufeld, of Dortmund, and consisted of seven strands, each constructed of a core of three wires, made of annealed crucible steel, each wire having a diameter of .005 inch. The seven wires next the core in each strand were of crucible steel, 2.2 millimeters (.0866 in.) in diameter, and the twelve outer wires were of the same material, and were 2.4 millimeters (.09449 in.) in diameter. The main core around which the seven strands were turned consisted of six strands, each strand of six wires, made of annealed iron, 2 millimeters (.0787 in.) in diameter, the core being of tarred hemp.

According to the regulations of Mining Police, the carrying power of crucible steel wire is limited to 114.6 kilogrammes per square millimeter (72.8 tons per square inch), that of annealed crucible steel to 80 kilogrammes per square millimeter (50.8 tons per square inch), and for annealed iron wire, 45 kilogrammes per square millimeter (28.5 tons per square inch), and accordingly the strength of the rope was equal to a total carrying power of 71.42 tons. According to the customary trials made with the wires of which the ropes are constructed in the works, the rope was found to be capable of carrying 80.39 tons. After the breakage the Mining Police took possession of the first 5 meters of the rope next the breakage, for trial, while 6 further meters were tried at the colliery, the results of which showed that the rope had deteriorated 18.25 per cent, after 11½ months' wear. The weight carried by the rope when raising coal was:

	Tons.
One cage complete, double decked (for four tubs)..	2.214
Four empty tubs or trams, averaging each 5.9 cwt.	1.181
Capacity of tubs—40 cwt. of coal, nearly	1.968
Weight of rope from pulley to deepest landing, 426 meters at 6.5 kilogrammes (13.1 lbs per yard)....	3.020
Total.....	8.383

Thus the rope could carry 8.5 times the load, and according to the trials made with the wire, 9.6 times, while after breakage the rope was still capable of carrying 7.8 times the load.

According to the regulations enforced by the Mining Police, the weight of the men allowed to be raised or lowered must not be more than one-half of the load when coal is raised. Therefore, in this instance $1.181 + 1.968 \div 2 = 2.574$ ton and allowing for the doors which are fixed in the cage when the men ride, 1.476 ton was the mean carrying capacity of the rope, which meant 20 men, allowing each man the average regulation weight of 1.48 cwt. (11.48 stone.) However, 25 men were in the cage at the time of the disaster, but this infringement of the law would not account for the accident.

On examination the rope showed that, after fracture, five of the seven strands were broken off nearly in one plane, and the fracture of each wire seemed as if it had been broken in a proof machine. The other two strands reached 150 millimeters and 250 millimeters beyond the fracture. This examination seemed to prove that the rope had broken suddenly. No marks were found on the guides of the pit to justify the surmise that the cage had become tight or wedged in them, and from the fact that the grease on them was found undisturbed, shows that the cage fell down the shaft without hindrance. The rope broke 1.5 meter above the shackle, and during the 11½ months of its use had been four times resocketed. The safety arrangements attached to the cage did not come into operation, found on examination to be due to derangement, probably the result of the sudden breakage of the rope.

The author, by elaborate calculations, endeavors to prove that the rope broke owing to the engineman forgetting, by oversight or accident, the near approach of the cage to the surface, when winding at a considerable speed, about 13 meters per second, and, fearing an overwind, he had applied the brake so vigorously as either to bring the engine quickly to rest, or so considerably slackened its speed that the cage traveled faster than the rope (owing to its momentum) formed slack rope, then, falling back on the slack rope, jerked and fractured it. The cage was so near the surface that the banksman just caught a glimpse of the bridle chains when it disappeared from his sight."

It will be observed that the law was infringed in this instance, 25 men riding in the cage instead of 20, that the rope snapped just as the cage reached the surface, that the breakage took place about 5 feet above the shackle, that the rope had been four times cut at the end and reshackled, and that although the cage was fitted with doubtless one of the best of the many Prussian safety arrangements, yet that this part of the apparatus failed to act, and 25 men were dashed to the bottom of the shaft (426 meters, or 1,397 ft.), and instantly killed.

Workingmen's Houses.

Herr Krupp, whose works are now larger than Essen itself, employing, including those engaged in the mining, 20,000 persons, began life on a small scale. In 1848 he did not employ over seventy persons in the cast steel manufactory. Essen, for a manufacturing place, is clean and well built. The road leading to Krupp's was shaded by trees on both sides. The area occupied by the works is much greater than that covered by the town of Essen itself, though the population, according to the census of 1880, was nearly 60,000. A road runs through the center of the works and leads to the colony, as it is called, where the operatives live. After nearly four hours' steady and rapid walking through myriad shops, some making crucible steel, some puddled steel, some Bessemer steel, and some Martin steel, through mills making steel rails, steel tires, iron and steel plates; iron foundries for machine castings and for projectiles; locomotive and wagon wheel works, boiler and girder shops, gun shops, mechanical shops, smiths' and a score of other kinds of shops, one is conscious only that he has had a bird's-eye view of Krupp's works. In these shops there are no fewer than 1,600 furnaces of various construction, not far from 300 boilers, between eighty and ninety steam hammers from 100 to 50,000 kilos. weight, twenty-five rolling trains, 320 steam engines, of from 2 to 1,000-horse power, and about 1,700 machine tools of various kinds. The machine shops remind me of those in Elder's shipyards at Glasgow, while the works as a whole seemed like several large steelworks combined into one. Nearly 3,000 tons of coal and coke are consumed daily in the works, and the smoke escapes from innumerable tall chimneys and blast furnaces. The establishment has its own water and gas-works, and besides the electric lights, there are 25,000 burners. The firm have their own chemical laboratory, photographic and lithographic establishment, printing shop, and bindery. There are about 50 miles of telegraph, and thirty-five telegraph stations belonging to the establishment. After I had inspected the works and admired the gigantic guns and the shops in which they were made, my guide kindly offered to take me to the colony to see the homes of the working men. These houses are not far from the works, but are comfortably located on high ground, and well shaded with avenues of trees. The firm of Fried-Krupp at present owns 3,250 well built, and to all appearances, healthy dwelling houses, in which over 16,000 individuals are living. The buildings have two or three floors, and are constructed partly of stone and partly of frame-work, and are surrounded as much as possible with gardens. The single dwellings, which, besides cellarage and garret, have from two to four rooms, are self-contained, and separated from the other dwellings. The letting to lodgers is permitted only in dwellings of three to four rooms, and must receive the special permission of the Central Committee appointed for maintaining cleanliness and order. The rent for the family dwellings varies as follows:—

	Per year. £ s. d.	£ s. d.
For two rooms in lodging-house or barrack-house.....	3 0 0 to 4 10 0	
For two-room house with cellar...	4 10 0 to 4 15 0	
For three-room house with cellar.	6 0 0 to 8 0 0	
For four-room house with cellar...	9 0 0	
For five-room house with cellar....		

Thus, for 4s. a week—the usual price for small cottages in the industrial districts of England—the German artisan at Essen can rent a large house and garden; while for 1s. 2½d. a week the British workman could not get a room. The Dundee pig-styes and the hovels of South Wales are rented at 2s. 6d. to 3s. a week. I visited a sample of each of the houses at Essen, and conversed with some of the inmates. Upon the whole they are better off than the industrial classes in many of the English districts. At the same time they did not strike me as more comfortably situated than the working people of a place like Middlesborough, where the houses are new and the operatives fairly well paid. The interiors of some of the Essen houses were any thing but clean and the atmosphere foetid. There is certainly no squalid misery, and the average workman and his family have plenty to eat and are comfortably lodged. The German drinks beer, and in the summer spends the evening, often with his family, in the beer gardens, of which there are seven belonging to Krupp. The German workman is more moderate, more economical, and drinks less gin than the iron-worker of Scotland and England, and rarely beats his wife. But even in a place like Essen, which is above the average, there is a marked difference between the Continental and American working man, and the condition of workers here will not compare with the advanced condition of the artisan in such places as Johnstown and Pullman in our own country. The single men at Krupp's are provided for in a large boarding-house, capable of keeping 1,800 boarders, at a cost of about 80 pfennigs (20 cents) a day, bread not included, making the probable cost about 1 mark, or about 25 cents per day. Herr Klupfel, the director, who has charge of the labor department at Krupp's, told me that no men were now being paid less than 3s. a day—this, of course, to the unskilled laborer. Skilled labor is paid from 3s. 6d. to as high as 7s. and even 9s. a day for skilled mechanics in the machine shops, but this was of course exceptional, the wages not often exceeding 5s. For these same classes of labor the American manufacturer probably pays 10s. or 12s., and even 20s. a day. Connected with Krupp's are sick and pension institutions, out of the funds of which temporary support and pensions are paid to members who have been disabled in the service of the firm, or to their widows; also to those who have worked for many years and are too old for further service. There are also a hospital, bathing establishment, life insurance union, and primary and industrial schools, all connected with the firm. The labor of women and children is excluded from the works."

"Speiss"

Who Discovered the Secret of Value in Slag Piles?

The answer to this question would be generally interesting in the scientific world, but particularly so in Eureka. It is here, we believe, that the "lead bath" process was first applied to extract from "speiss" (until recently looked upon as mere refuse from the furnaces) the small per cent of the precious metals that it retains. The process has proved very valuable, as is shown by the "bonanza" developed in the Richmond slag dump, in which, as in a new mine, a force of men are employed extracting lead and "speiss," on which one furnace is kept continuously at work. Just what the "lead bath" process is, or what the results of working by it have been, can not be accurately stated. There is an air of secrecy and offishness about those who are said to be informed which impels inquiry. Its evident importance, however, judged by what report says of the developments in the Richmond dump, and Hauk Donnelly's project to apply the process to the big Eureka Con. dump, make people talk about it considerably. St. George T. Bryant is said to have discovered the principles involved in the "lead bath" process which are being applied now at the Richmond works. It is stated that some years ago he suggested the idea to Mr. Probert, who put him aside impatiently, and that he broached the subject afterwards to Hank Donnelly, Superintendent of the Eureka Con., who brusquely invited him to stand aside, as he was in the way of the miners. It seems, according to report, that Mr. Prohert reflected on Mr. Bryan's proposition at a later day, and put his ideas to a successful practical test, as intimated. And now comes Mr. Donnelly, so the story goes, and leans upon Mr. Bryant as his right hand man in his great project to separate the gold and silver and the iron from the speiss accumulated at the reduction works of the Eureka Con. Mr. Bryant is at present East, and it is said that his business is in the Patent Office at Washington, D. C.; in other words, that he has gone to headquarters to take the necessary steps to get out a patent for the invention of the "lead bath" process, as it is known in Eureka. It is speculated, also, that Mr. Probert claims a right to a patent to the same or a similar discovery—the process in use at the Richmond—and that he either has applied for a patent or is about to do so; and that he will protest against the right of Mr. Bryant to the patent in question. There are those who say that St. George has slept upon his rights until he has practically forfeited them, and that all he can do will be to bar anybody else who applies for a patent for an invention the principles involved in which he is alleged to have discovered a good while ago; while there are those who say that he has the inside track in the whole matter. Again there are those who say Mr. Probert is master of the situation, and fully entitled to the mastery. The report here is that he is en route to Washington City to measure words (figuratively speaking) with the chivalric St George.—*Eureka Sentinel.*

The Largest Locomotive.

There is now a mammoth locomotive in process of construction at the Central Pacific shops at Sacramento. The name is "El Gobernador." The total length of the engine and tender is 65 feet and 5 inches; driving-wheel base, 19 feet and 7 inches, five pairs of drivers, 4 feet and 9 inches in diameter, with a four-wheel truck in front; water capacity of tender, 3,600 gallons; cylinders, 21 inches in diameter, with a 36-inch stroke; total weight of engine, 73 tons; weight on drivers, 64 tons; weight of tender (light) 50,650 pounds; total weight of engine and tender (light), 98 tons 650 pounds. There are two six-wheel trucks under the tender, making a total of 26 wheels under engine and tender. The valve gearing, designed by A. J. Stevens, is something entirely new, there being nothing like it in the country. It is said to be the largest engine in the world. It is for use on the Sierra Nevada Mountains, and it is expected will do more work than two of the engines now used, with less consumption of fuel. The heaviest engine now in use on the C. P. R. R. has hauled 19 cars, loaded, up a 116 foot grade. Its dimensions are: Weight of tender (light), 63,000 pounds; weight of engine, 123,000 pounds; water capacity of tender, 3,000 gallons. It has 8 drivers of 4 feet 8 inches each; driving wheel base, 15 feet 9 inches; total wheel base, 53 feet 1¾ inch,

Antimony.

The ore of this metal occurs abundantly in California and Nevada, as well as in other parts of the Pacific division. The heaviest deposits, so far as known, exist at the Bonshay and Temple mine, in San Emidio Canyon, Kern County, California, and at a point twelve miles south of Battle Mountain, a station on the Central Pacific Railroad, in Humboldt County, Nevada. At the latter place the ore occurs in two parallel veins, about 100 feet apart, and cropping out strongly for the distance of a mile or more. These veins are nearly vertical, and stand between regular, well defined walls. From one of them, which carries a stratum two feet thick of solid sulphuret of antimony (stibnite), several hundred tons of ore have been extracted. Some of this was reduced in the small works put up at Battle Mountain Station, and some lots were shipped to San Francisco and New York, but the bulk of it was left on the dump at the mine. An analysis of an average sample of this ore, rough dressed, gave the following result:

Moisture	2.83
Alumina	1.65
Silica	12.62
Antimony	62.28
Bismuth	6.63
Sulphur	19.31
Oxygen (calculated)	4.06
	99.30

While this ore carries from three to fifteen ounces of silver per ton, it is entirely free from lead and copper, a feature that greatly facilitates its reduction to a regulus by the most inexpensive and simple process. Some of the metal disposed of in the New York market is said to have given entire satisfaction, though not quite free from sulphur. Mining the ore at this point costs $2 per ton; freight to San Francisco, $10 per ton; hauling to the railroad, $4 per ton. To England, via Cape Horn, $15 per ton; value of ore in England, $50 to $60 per ton; regulus, 12 cents per pound. After being worked in a small way for several years, commencing in 1871, operations were suspended at this mine, nor has much been done there since, the bulk of the ore being of too low grade to warrant further attempts at handling it.

The lode San Emidio is represented to be much larger than at the Battle Mountain mine, being from thirty to forty feet thick, and containing immense quantities of ore; some of it very rich, the mass of it, however, of rather low grade. A good deal of money was expended there in 1876 in the erection of a furnace, building roads and making other improvements, but the enterprise having failed to prove remunerative, work was soon after suspended, and has so remained since. The principal obstacle in the way of success here was the cost of transporting supplies to and the ore and metal from the mine, which is situated high up in the mountains and a long way from the railroad. A similar enterprise, attended with not unlike results, was inaugurated about the same time at the Stayton mines in San Benito County, California. Two furnaces were put up here, and other improvements made at considerable cost, but the undertaking, though well managed, had to be given up after a few years' trial, the cost of production and transportation to available markets being too great to leave any margin for profits; and yet the ore of this locality would in most countries be considered high grade, having averaged about forty per cent metallic antimony.

Under the impression that they would be able to obtain an adequate supply of antimonial ores cheaply, Messrs. Starr and Mathison, of San Francisco, erected in that city several years since works for the reduction of this class of ores. Although these works were of limited capacity and the metal produced was equal to the best imported, the proprietors, after struggling along for a few years, were obliged to close the works, having been unable to get enough ore of suitable grade to keep them running. As they had to market the product of their works in New York, they were unable to smelt ore carrying less than fifty-five to sixty per cent metal. The consumption of antimony on the Pacific Coast is inconsiderable, amounting perhaps to not more than twenty-five or thirty tons per year; not much is used except in the manufacture of type, britannia ware, and babbit metal.

The shipments of antimony ore from San Francisco to England amounted in 1882 to 85,850. The Southern Pacific railroad carried East during the same period 60,130 pounds of metallic antimony shipped from San Francisco and Oakland.

Antimony occurs as a sulphide, and probably in other forms, associated with silver, lead, copper, etc., in many veins and deposits of ores of the latter metals throughout the Rocky Mountain region, but as yet has not been found in sufficient quantity to become commercially valuable. In the Wood River County, Idaho, it occurs in association with the argentiferous lead ores, as is very generally the case in the silver-lead districts of the Far West. The distance from reduction works, and the high cost of transportation, will prevent the successful working of any but the richest and the most accessible deposits.—*Mineral Resources of the U. S.*

THE question of making a second canal across the Isthmus of Suez is occupying the active attention of the Egyptian Government.

USEFUL INFORMATION.

Wetting Lead-Pencils.

The act of putting a lead-pencil to the tongue to wet it just before writing, is one of the oddities for which it is hard to give any reason, unless it began in the days when pencils were poorer than now, and was continued by example to the next generation.

A lead-pencil should never be wet. It hardens the lead and ruins the pencil. This fact is known to newspaper men and stenographers. But nearly every one else does wet a pencil before using it. The fact was definitely settled by a newspaper clerk away down East.

Being of a mathematical turn of mind, he ascertained by actual count that of fifty persons who came into his office to write an advertisement or a church notice, forty-nine wet a pencil in their mouths before using it. Now this clerk always uses the best pencils, cherishing a good one with something of the pride a soldier feels in his gun or his sword, and it hurts his feelings to have his pencils spoiled. But politeness and business considerations require him to lend his pencil scores of times a day. And often, after it had been wet till it was hard and brittle and refused to mark, his feelings would overpower him. Finally he got some cheap pencils and sharpened them, and kept them to lend. The first person who took up the stock pencil was a drayman, whose breath smelt of onions and whisky. He held the point in his mouth and soaked it several minutes, while he was torturing himself in the effort to write an advertisement for a missing bull-dog. Then a sweet-looking young lady came into the office, with kid gloves that buttoned half the length of her arm. She picked up the same old pencil and pressed it to her dainty lips preparatory to writing an advertisement for a lost bracelet. The clerk would have stayed her hand, even at the risk of a box of the best Faber pencils, but he was too late. And thus that pencil passed from mouth to mouth for a week. It was sucked by people of all ranks and stations, and all degrees of cleanliness and uncleanliness. But 'twere well to forbear. Surely no one who reads this will ever again wet a lead pencil.

INCOMBUSTIBLE PAPER.—At the recent meeting of the French Societe d'Encouragement pour l'Industrie Nationale, M. G. Meyer, of Paris, submitted specimens of paper specially manufactured to resist fire. It was stated by him that the papers and documents shown had been for four hours in a retort in a pottery furnace, and it is further affirmed those present were unable to distinguish, either by appearance or texture, the papers so treated from others which had not undergone the ordeal of fire. From experiments made with a specimen of wall paper sent us, we are enabled to say that, although the appearance of the paper does not change, the fire resisting properties claimed for it are undoubted; the paper certainly does not ignite. The paper, we are informed, can be made of a quality suitable for deeds and other important documents, or of a quality suitable for wall paper, theatrical decorations, or in fact for any purpose for which paper is used. M. Meyer has also invented an incombustible ink and incombustible colors. Artists using those colors may preserve their works to a certain extent; but the invention would appear to be of the greatest value to theatrical managers. By using thick cardboard of M. Meyer's material, together with his paints, they are able to render their scenery uninflamable. At the same time, for documents of importance, deeds, wills and agreements, the invention should come into universal use.

A NEW PAPER-MAKING SUBSTANCE.—A Frenchman, M. Reynaud, has discovered a new fiber for paper-making, in Algeria, in the shape of the dwarf palm, a great enemy to agriculturists. This plant is full of fiber, and the gentleman named has found means for utilizing the whole of it, except the roots, which serve for firing. Every part from the stalk to the topmost leaves is transformed into fiber of excellent quality, and it makes no difference if the plants have been pulled up several years previously. They are placed in a kind of cage, which is immersed in a boiler containing a special lye, and heated. The substance thus treated becomes soft, so that the fiber may readily be separated. It is withdrawn from the bath, and drained, the lye being saved for rollers, while, at the same, time being made cold use over again. It is then passed between by quantities of water. The number of rollings, rinsings and combings, depend upon the degree of fineness required. At last the product is allowed to fall into a receptacle containing clear water, whence it is withdrawn, to be tied up in bundles for transport.

ADULTERATION OF LARD.—The Board of Trade of the City of Chicago has succeeded in puzzling several chemists, who analyzed, as experts, some samples of prepared lard, two of which were pure and the others purposely adulterated with cotton-seed oil and tallow. The result, as published by the Board of Trade Committee, indicates, by reason of the widely different results attained by different chemists, that there is no sure method of determining the presence of beef-fat crystals when mixed with hog-fat crystals; at least, that the chemists employed did not succeed in finding such a method. It is claimed that fat crystals differ when found in the hog and in the cow. It is a desirable point to settle, as it has an important bearing on the future adulteration of lard. If tallow and cotton-seed oil can be employed without detection in the adulteration of lard, it may be taken for granted that they will be so employed.

AN IRON THEATER.—A company is said to have been formed to carry out a "reformed theater," a model of which has recently been exhibited. Every thing possible about this theater (says the *Pall-Mall Gazette*) is of iron. All the scenes and curtains are lifted and lowered by hydraulic machinery, so that only about one sixth the number of men usually required suffice to "work" every thing, and the scenes can be changed in a surprisingly short time. The stage floor is in a number of rectangular sections, each of which can be raised and lowered independently, by hydraulic power. This, it is said, gives power to produce many very remarkable and picturesque effects which are impossible with ordinary stage machinery. Thus the stage may be made to slope backward and downward, so that the audience may suddenly find themselves at the top of a mountain range, looking down into a series of deep valleys.

TO DETECT ground rice in buckwheat flour: Heat a quantity of concentrated lye, mixed with water, in half as much flour, to the consistency of paste. If there be rice flour in it, the mixture will appear yellow, and on the addition of muriatic acid, white; if buckwheat alone, the paste will be dark green, and with muriatic acid added, red. On pouring spirits of wine containing muriatic acid over the mixture, if rice flour be contained in it, it will be colorless; if buckwheat alone, brownish. Seen under the microscope, there is no difference in the starch grains of the rice and the buckwheat. —*Dr Walzen Mueller.*

GOOD HEALTH.

Insane Asylums.

The insane asylums of this country have recently challenged public attention. Their management has been much discussed, often unfairly and hypercritically, but there is no doubt that these institutions, while magnificent in architecture, and while grandly generous in endowment and support, are false in organization, and generally fail to cure. Among their faults we mention, first, their vast size and the great number of patients under one management. With the highest sense of duty on the part of the superintendent, minute and frequent study of the individual case is impossible. Every thing falls into routine, and is left to the care and management of attendants, who are rarely persons of intelligence and sympathy.

The practical outcome of the great insane asylum is that hundreds of persons, many of whom need the most careful, discriminating study, are treated much as farmers treat unruly cattle—they are kept inside of a high fence and not allowed to hurt each other. With the exception that the insane are dosed with anodynes to make them sleep, it would be somewhat difficult to point out the differences between the usual management of the insane and the management of unruly cattle.

We mention next, though it stands first in practical importance, the utter seclusion of the inmates of these asylums from the outside world. Interested for years in the management of these institutions, the conviction constantly grows upon us that our insane will never receive justice, they will never be wisely and tenderly managed, until the light of day is let into their places of confinement.

The reason most frequently given for interdicting correspondence is that the patients might trouble their friends with improper letters. This is not a good reason. No one with a spark of human sympathy would give such a reason. The patient, sick of typhoid fever at home, and abandoned because he was a trouble to his friends, would be a parallel barbarity. In civilized life, the convenience of the well always gives way to the necessities of the sick. The ease of the sick brain should be no exception. We do not now argue this point; we only wish to say that our insane asylums can never be brought into harmony with civilization until a United States mail-box is within easy reach of every patient, to be opened only by the regular mail-officer, with the usual severe penalty unsparingly enforced upon all interference with the letters deposited therein—*Dio Lewis's Monthly.*

CREMATION.—Doubters are now convinced that the cremation movement will triumph. It is right; it is honest; it is clean. It is quite as sentimental as burial in the ground. It is right, because it removes from millions of the poor a great load. It is honest, because the soil contains only a small percentage of the precious materials which can be appropriated by our bodies. To withhold these precious atoms from general circulation for thirty or forty years is not honest. Through cremation these atoms are all returned at once to the atmosphere, and quickly reach the soil. It is clean, as every one knows. Graveyards have long been a detriment to the health of the living. Water circulates through the earth as blood circulates through the body. The impurities of graveyards find their way into this general circulation. A beautiful urn, containing the dust of the loved one, may be kept in some sacred place in our home.

TO CURE WARTS.—There are several ways by which these troublesome excrescences may be removed, as follows: Burn a piece of linen or cotton on any piece of steel, and rub the moisture left on the metal by the burning on the wart three or four successive times. (2) Rub the wart with a strong solution of potash till it disappears. (3) Wet gum ammoniac and rub it on the wart at night just before going to bed. (4) Cover a few sprigs of arbor vitæ with hot water; when the tea is quite strong, pour off, and bathe the warts with this, or crush the juice of the leaf directly on the wart three or four times a week, till it disappears. (5) Take 5 cents' worth of muriate of ammonia, wet a crystal in water, and apply several times during the day. (6) Cover the warts with baking soda, wet with water and tie them up. A few applications will remove them.

DEATH FROM THE SCRATCH OF A CAT.—On Tuesday, Sir John Humphreys held an inquest at Mile End, London, on the body of Louis Cain, aged 73. John Cain, 94 Malpin street, Mile End, Old Town, stated that deceased was his wife, and about three weeks ago she went to put the cat in the back-house, and in doing so the cat scratched her on the hand. The deceased afterwards became unwell, and went and saw a doctor, who prescribed for her, but she got gradually worse, and died on Tuesday morning. Previous to the scratch the deceased was in good health. Mr. Porter, surgeon, stated that when he saw the deceased she was suffering from an injury between the thumb and first finger, and erysipelas supervened. The cause of death was pyæmia, consequent upon the scratch. The jury returned a verdict of "Accidental death."—*Cardiff Mail, October 13th.*

"WHAT IS ONE MAN'S MEAT IS ANOTHER MAN'S POISON."—Good beef, good bread, exercise, sunshine, pure air, temperance, cleanliness, abundant sleep, a cheerful temper, and a hundred other things, are every man's meat, and no man's poison. It is true there are some things which one man can bear and another can not, but they are of doubtful utility. If you keep to the safe and good in food and drink, there is no truth in the old saw that "What is one man's meat is another man's poison." This old saw is made to cover a multitude of dietetic sins. Thousands of persons starve themselves into thinness, paleness and nervousness, by living on white bread and sweet things, and sleeping too little. Oat meal, cracked wheat, graham bread, and beef, with plenty of sleep, would make them plump and ruddy.—*Dio Lewis.*

LEARN TO LAUGH.—Blessings on the laughers, no matter of what style. Of course we all like ha-ha-ha, and we don't like he-he-he, or ho-ho-ho, or haw-haw-haw; but give them all a welcome. The worst of them are a thousand times better than the whiners. Hearty laughter is better than pills for dyspepsia, better than chloral for neuralgia, and better than balsam for consumption. Come on, brothers and sisters, with your ha-ha-ha, and your he-he-he, and your ho-ho-ho, and your haw-haw-haw, and all the variations; you are welcome. But you long-faced, whining, groaning wretches, avaunt! I would rather have the cholera come this way than you. Why don't you cut your throats? I will sit on your case as a juror, and bring in a case of justifiable suicide.—*Dio Lewis.*

ADULTERATIONS OF TEA.—In the *Sanitary Engineer* of June 1, 1880, is the statement that 7,000 chests of adulterated tea have been recently burned by order of the British government. An analysis of many samples, taken at random, showed 65 per cent of adulteration. In each 100 pounds of tea there were 65 pounds of poisonous adulterations. Eleven different poisons were detected, some of them deadly. Probably the worst of the Chinese teas come to America. The Chinese know that the British government watches and analyzes, while we Americans ask no questions. A large percentage of the stomach pain and indigestion among American women may be traced to tea.

TEA.—In the London *Medical Times* appears the following paragraph: "Dr. Heath, of Newcastle, has been the last to raise his voice against tea. But it has long been a fact familiar to us that tea is a most fruitful source of dyspepsia. Among the vast numbers of poor women who frequent the patient-rooms of our London hospitals, we should not be far wrong in saying that two-thirds are suffering from dyspepsia. This dyspepsia almost invariably arises from two causes—the want of proper food, and the abuse of articles like tea, which stay the craving for food, but which aggravate the consequent conditions of the digestion.

BED SORES may be prevented by the following precautions: Keep the sheet below the patient perfectly smooth; wash the parts where the bone is prominent, daily, with soap and warm water, dry them well, rub them over with a little spirits of wine or whisky, to harden the skin; change the patient's position frequently; never let him lie on a blanket.—*For E. M, M.*

Passing Events.

THE several rainy days of this week bring us to the consciousness that winter is really here. It is warm and mild in these latitudes, but in the mountains the snow will soon drive all the proprietors into winter quarters. There is very little new to report from the mining regions of this state. Work is being continued in the various districts. The famous debris suit is still pending, but a decision is daily expected. The organization of a local "Manufacturers' Association" is noted in another column. Diggings are announced to have been discovered on a tributary of the Skeena river, B. C., where $20 to the hand is the yield; but, as usual with such diggings, they are a long way off and the climate is very severe. Still, some men will winter up here this year.

The annual report of the Director of the Mint shows that the gold received and operated upon during the year was valued at $49,000,000, while the silver amounted to nearly $39,000,000. The coinage for the year was valued at $66,200,704, the total gold coinage being $35,936,927 and the silver $28,835,470, of which $28,111,119 was standard dollars. The profits on the coinage of silver dollars amounted to $3,701,331, and the silver profits of the last five years amounted to $13,860,310. The silver circulation, the Director says, is in excess of the requirements, and he expresses a belief that the equal coinage of both gold and silver by all nations is desirable. He suggests that Congress should consider the question whether the law directing the monthly coinage of two millions of silver dollars should not be modified or repealed.

A New Ore Concentrator.

A new ore concentrator, of that class usually known as percussion tables, has been patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Charles C. Rueger, of this city. The machine is provided with a series of triangular tables having a durable and smooth working surface. These, with the other operating parts, are arranged radially around a vertical shaft securely fastened to it in any desired manner, and to each other. A suitable inclination is given to the tables, placing the three corners of each at different levels, but corresponding in each table, being highest at the center shaft, with the radial line of greatest pitch along one side of the table, so that only alternate outside corners of the triangles will be in the same line.

The triangular tables are made of wood, in an iron frame, the wood being covered with rubber cloth. A sufficient number of these tables are arranged around the common central shaft, to close the circuit, and thus form a conical aggregation of tables. The several tables are then joined together, provision being made, however, for regulating the inclination of the planes. Cast-iron gutter-shaped bars, which unite the angle iron side-bars, form the periphery of the conical aggregation of tables. The gutters also serve as receptacles and conduits for the various products flowing from the concentrating planes. For each product a separate compartment is provided in the gutter, by putting into them a sufficient number of partitions. The products of concentration make their exit from these compartments through holes in the bottom of the gutter connecting with outflow pipes, which conduct the product to receptacles suitably disposed underneath the machine.

All the outflow pipes for the poor or waste product are run to the bottom of the central shaft, and are firmly fastened to both gutter and shaft, so as to serve as a stay or brace to the table, increasing the rigidity of the structure and preventing injurious vibration when in operation. The discharge ends of these pipes are led in different directions, carrying the valuable product one way and the waste another.

The supporting frame for the concentrator is made of one or more arcs of cast iron, bolted together for a full series of tables to form a ring, and it is provided above and below the tables with bearings at the center, for the upright shaft, to which the tables are attached. On this cast-iron frame is the driving mechanism of the concentrator, consisting of a short horizontal shaft, with belt-pulley and cam. The cam, rotating, pushes against a bar projecting from one of the tables, thus acting against the pressure of a spring, so disposed that when the bar is released from the cam-face the table recoils against one or more abutments.

The rapid reciprocating action of the concentrator by the cam and spring effects the agitation of the pulp, and the percussion effects its diagonal course over the plane. In this manner one cam will drive a number of tables. By having a cam at each end of the shaft, and making the latter common to two frames, two full series of tables can be driven with one belt, and with proportionally less power than in series, giving economy of space, power, and motive mechanism.

The action of the Rueger concentrator most closely resembles that of the Rittinger side-percussion table, in so far that the ore pulp, while flowing down an inclined table, is agitated by an oscillating motion given to the plane, which allows the particles to settle in the order of their density. At the same time they are subjected to a lateral percussion action which causes them to take a diagonal course on the plane in flowing down toward the discharge edge.

The Rittinger table, however, is a rectangular parallelogram, or a series of such parallelograms set parallel to each other, suspended from rods and inclined at an angle of from three to six degrees, the upper and lower edges or rims being horizontal, making the line of greatest pitch run parallel to the long side. In Mr. Rueger's invention the concentration table is of triangular form, a series of them radiating and inclined from a common central axis, and the line of greatest inclination running from a point on one of the radial sides to the opposite corner or angle of the triangular table, so that the three angles of the table are at different elevations, the most acute central angle being the highest. In this invention, also, the ore pulp runs upon the tables through openings in the circular trough-shaped distributer which is common to the series of tables and affixed to the central axis. The pulp spreads in a thin layer over the table, and runs down towards the lowest corners, subjected meanwhile to an agitating action which facilitates the settlement of the denser particles, and a percussion action which causes the pulp to travel towards the higher outside corner of the triangular plane. This agitating and percussive action is not uniform over the length of the table, as in the Rittinger machine, but accelerative, increasing as the pulp approaches the discharge edge. The motion, also, is not in straight lines, as in the Rittinger machine, but in arcs of concentric circles, which induces a centrifugal action on the ore particles favorable to separation. The denser ore particles traveling most slowly downward, by virtue of their greater adhesion to the surface of the plane, are subjected longest to these actions, which causes them to take a more diagonal course than the less dense particles. In their course they are met by currents of more or less clear water flowing from perforated pipes extending from the central distributing trough to the higher outside corners of the tables. The flow of this clear water being naturally towards the lowest corner, it must cross the course of the concentrates, carrying the less dense particles still admixed therewith towards their proper place of discharge. The three usual products of concentration—tailings, concentrates and "middlings"—flow into separate compartments of the gutter attached to the lower edges of the triangular tables, and then through orifices and discharge pipes into suitable receptacles, as before described.

Mining Products.

Many persons imagine that the mines of the country are represented solely by the gold and silver yield. Aside from gold, silver, copper, lead, iron and coal, there are very many substances obtained by mining which are added yearly to the products of the country. We take a table from a recently published government work on the "Mineral Resources the United States," which gives the yield for the year 1882 of a number of substances for which mining is carried on as follows:

VALUES OF THE METALLIC PRODUCTS OF THE UNITED STATES IN 1882.

Pig iron, spot value	$106,336,420
Silver, coining value	46,800,000
Gold, coining value	32,500,000
Copper, value at New York City	16,038,091
Lead, value at New York City	12,624,550
Zinc, value at New York City	3,046,020
Quicksilver, value at San Francisco	1,487,537
Nickel, value at Philadelphia	309,777
Antimony, value at San Francisco	12,000
Platinum, value at New York City	1,000
Total	$219,756 004

VALUES OF SOME OF THE NON-METALLIC PRODUCTS OF THE UNITED STATES IN 1882—ALL SPOT VALUES, EXCEPT CHROME IRON ORE.

Bituminous coal, brown coal, lignite and anthracite mined outside of Pennsylvania	$70,070,487
Pennsylvania anthracite	70,550,094
Crude petroleum	23,704,698
Lime	21,700,000
Building stone	21,000,000
Salt	4,320,140
Cement	3,072,750
Limestone for iron flux	2,310,000
Phosphate rock	1,147,830
New Jersey marls	540,000
Crude borax	338,903
Mica	250,000
Crude barytes	160,000
Chrome iron ore, value at Baltimore	100,000
Soapstone	90,000
Manganese ore	52,500
Asbestus	30,000
Graphite	34,000
Sulphur	21,000
Cobalt ore and matte	15,000
Precious stones, uncut	12,500
Asphaltum	10,500
Corundum	6,250
Pumice-stone	1,750
Total	$226,156,402

RESUME OF THE VALUES OF THE METALLIC AND NON-METALLIC MINERAL SUBSTANCES PRODUCED IN THE UNITED STATES IN 1882.

Metals	$219,756,004
Mineral substances named in the foregoing table	226,150,402
	$445,912,406
Fire-clay, kaolin, potter's clay, common brick clay, terra-cotta, limestone used as flux in copper and lead smelting, iron ore used as flux in lead smelting, pyrites (for acid making), zinc white made directly from ore, marls (other than New Jersey), apatite, gypsum, tin ore, bismuth, arsenic, iridosmine, mill-buhrstone and stone for making grindstones, lithographic stone, talc (other than "soapstone"), quartz, feldspar, fluor-spar, terra-alba, chalk, crude mineral paints, nitrate of soda, carbonate of soda, sulphate of soda, native alum, ozocerite, mineral soap, strontia, etc.—certainly not less than	8,000,000
Grand total	$453,912,400

The grand total might be considerably reduced by substituting the value of the iron ore mined for that of the pig iron made; by deducting the discount on silver; and by considering lime, salt, cement, borax, etc., as manufactures. It will also be remarked that the spot values of copper, lead, zinc, and chrome iron ore are much less than their respective values after transportation to market.

Blasting in Mines—No. 14.

Judson Powder.

This powder has had as great success as the Giant. The latter company introduced it first on gravel claims, blasting banks of gravel, cement, pipe-clay, etc. Herein the powder met with surprising success, on account of the simultaneous explosion of the whole mass. The attention of railroad men was soon called to Judson powder, and after careful tests it was adopted by the Central Pacific and Southern Pacific railroad builders, under J. H. Strobridge, Esq. When the Oregon railroads were started, the Judson underwent there another careful test by the Superintendents of Construction of the Northern Pacific, Oregon Railway and Navigation Company, Oregon and California railroad, and Oregon and Pacific railroad, and was declared and accepted as the best con-grade explosive.

Directions for Using.

1st. As to quantity—Use the same as with common black blasting powder, until you are satisfied less will do the work.

2d. As to exploding—The powder will explode with a triple force Giant-powder cap. It is a great advantage to place the cap in the middle of the charge instead of the top. This produces a surer and better explosion. Quintuple caps are still preferable. Railroad men use always a part of a cartridge of Giant powder.

3d. As to keeping—The powder must be kept in a dry place, and not exposed to the air. The company advises miners, when they receive the powder in bulk, and not in cartridges, to empty a case at a time into tin powder-cans, which must always be kept well closed, and use the powder from these cans and not direct from the cases, as the powder attracts moisture when they are left open.

4th. As to tamping—The same rule applies as with common powder; the more and better it is tamped the greater the execution.

5th. See that the powder is not put into bore holes with water in them, as it damages from wet about as readily as common blasting powder.

6th. For bank blasting—No special instructions can be given. Under high and heavy banks stack the powder in various places in the "tees," and when possible fire with battery. In "toe and bottom" shots, tamp close to the powder, in order to get the shattering effect.

For Stump and Tree Blasting.

Since the introduction of Judson powder, the railroad companies, farmers and others have applied it in removing stumps and trees. This has especially been the case on the before-mentioned Oregon railroads. Trees and stumps, no matter how large, are being blown hundreds of feet out of the way. To do the work the following directions should be followed:

1. Put down a hole, at an angle of about 30 degrees between the roots to a point under the center of the stump or tree; spring this hole with a cartridge of No. 2 Giant powder, by exploding the same at the bottom of the hole. This blast will produce a large cavity; charge this with Judson powder, and fire with a primer of Giant powder.

2. Dig a hole under the stump or tree, between the roots, put in a box with 10, 25 or 50 pounds of Judson powder, according to the size of the stump or tree; or, better still, put the Judson powder in a bag. The advantage of having the powder in a bag is that the hole has to be made between the roots, and deviates frequently from a straight course by the irregularity of the roots. A bag can easily be pressed into such hole to reach the center under the tree or stump, which could not be done when the powder is in a box. After having put a small primer of Giant powder, with fuse and cap attached, through a hole into the box or bag of Judson powder, then tamp the hole with dirt. Experienced railroad men say that this is the easiest and cheapest way of removing the largest stumps.

The Giant Powder Company is making also a very strong Judson powder, of two grades, calling the same F Judson and FF Judson. In tunnel and open-air blasting, those who have used it say it is fully as strong as any second grade nitro-glycerine powder. These two grades are considerably cheaper than the second grade nitro-glycerine compound.

HISTORY OF CALIFORNIA MINING.—The publication of the second one of the series of articles on this subject is unavoidably deferred to next week, when the series will be continued.

Manufacture of Charcoal in Kilns—No. 2.

At one end are two doors, one above and one below, both of which are used for the introduction of wood, at other times there is only the lower one. The discharge of the charcoal is made by the lower door only. These doors are generally five feet square, and are supported on hinges on a cast-iron frame. They are best made of cast iron, in two parts. Sometimes they are made of a single piece of sheet iron. The upper opening is sometimes the same size as the lower one and sometimes about thirty inches square, and is also closed with a sheet or cast iron door. On the sides, between the braces or buttresses, there are rows of openings, called vent-holes, regularly spaced, vertically and horizontally, for the introduction of the air necessary for combustion, and to allow the products of distillation to escape. Vertically there are three or four of these. Between the braces, horizontally, there may be only one row, where the braces are very near to each other; or two rows for the lower and one for the upper, or three in each row, as in Fig. 3. The number is regulated by the way the bracing is done. They are almost always placed one directly over the other. To each of these a name is given. The lower one is called the foot vent, the middle one the knee vent, and the upper one the shoulder vent. On the ends of the kiln the vents are placed less regularly than on the sides. Sometimes there is only one row, one above the other; sometimes one row not in line, as in Fig. 3, and sometimes there are more. From three to four vent holes are usually made in the lower doors. These openings are usually of a size to admit a single brick.

The wood is usually cut to a length of four feet, and laid flat, piled as closely as possible, so as to leave very few interstices. Stronger charcoal would probably be produced if it were placed on end, but the extra cost of labor to pile it in this way would more than compensate in expense for the extra quality. Four men, working one day, are required to fill a 45-cord kiln. The sticks are laid on the floor as closely as possible, putting the logs in the direction of the length of the kiln, and piling them in successive steps, so as to fill it up to the arch.

There are several methods of lighting the kiln. In Sweden, where these kilns were first used, they were always fired from a permanent structure in the center of the kiln, to which access could be had from the outside. In this country no permanent structure is made. When first used in New England they were lighted in one corner. The fire was then drawn along the long side, and so round the kiln on the outside of the wood, so that the heat acted directly on the walls. Such a direct exposure to the heat and pyroligneous acid rapidly destroyed the mortar in the walls, which became cracked, and after a short time the yield of the wood in charcoal was materially diminished. The lighting is sometimes done by a chimney left in the wood in the center of the kiln, from above, exactly as in the meiler, the fire being drawn down by the openings in the sides; this chimney may or may not connect with a channel leading to the discharging door. This method is used in the South and Southwest of the United States, and is practiced in Mexico, and is preferred when the kilns are very wide. It is considered by many to give the best results, both as to yield and quality of charcoal.

Sometimes the lighting is done by means of a channel built through the middle of the kiln, having an opening at each door. This is also filled with dry wood and shavings, which are lit from the back door. The fire is then drawn through the wood to the front door by properly manipulating the vents. When the fire has reached the front both doors are closed, as the whole kiln is then lighted. This method is called the *center burn*. In both these last methods as the, fire is generated in the wood, the heat does not affect the walls of the kiln. The time required for these methods is not more than half that of the first method.

That the charge is ready to be drawn may be ascertained by taking off the cover on the top and opening a few of the vents. If after two or three hours there is no appearance of fire or of smoke the kiln may be drawn. If the kiln is opened too soon water must be pumped in at once, as the charcoal would take fire.

The whole art of the process consists in closing the vent-holes at the proper time. As soon as the kiln is well lighted the two lower rows are closed. The vents of the upper row are closed little by little. Those of the middle in the upper row are usually closed first; then those from which the blue smoke comes in their turn. When the vents of the first row are being closed, those of the middle are opened, and so on. One man by day and one man by night can easily superintend five or six such kilns. He has little to do except to draw the fire regularly down, to watch the color of the smoke so as to close the vents at the proper time, and to close any cracks that may form.

The rectangular kiln is going out of favor, for the reason that there is so much space heated, with such thin walls, that the number of braces has to be very large to secure a tight kiln, and that when once cracked, it is almost impossible to repair it so as to make it tight.

Round Kilns.

The round kilns, Figs. 4 and 5, differ from the rectangular ones only by their shape. Fig. 4 shows the form usually employed among the bloomery forges of Northern New York; Fig. 5 is that employed for blast-furnace fuel in Vermont; Fig. 4 is built with vertical walls, and is braced with wooden posts and iron straps. Such kilns can be seen near Roger's Rock, on Lake George, and at Black Brooke, Essex County, N. Y. Fig. 5 is built with battered walls, which are 28 feet at the base and 26 feet at the spring of the arch, and has no bracing. In all other respects the kilns are similar. The arches of both these kilns are supported by iron rings at their base. Fig. 5 A shows the lintel of the discharging door; Fig. 5 B shows the shape of the cast-iron door E at the top of the kiln. They have three rows of vents, one at the base, with six courses of brick between each of the others. These vents are 2 by 4 inches and 18 inches apart. They are usually 28 to 30 feet in diameter at the base, and 26 to 28 feet at the spring of the arch. The vertical walls are 11 to 12 feet to the spring of the arch, and 1 foot thick. The arch is 8 inches thick and is laid in headers. Such a kiln will have about 300 cast-iron vents, which weigh about eight pounds each. Thus a capacity of from 40 to 45 cords requires more precautions in building when the walls are not battered, and besides the usual braces, must be hooped with strong iron bands. The doors are made of No. 10 sheet iron. The top opening is a cast-iron ring, which together with the lintel of the door weighs about 1,500 pounds. The wrought-iron bands around the kiln weigh about the same. They require about 36,000 brick. These kilns are usually built against a bank, so that the top can be reached from it.

The filling is commenced by placing pieces about .15m. diameter radially, leaving interstices for air-channels; above this, about .60m. of dry wood and brands are placed, leaving a space in the center about 1.20m. in diameter for a chimney, which is carried to the top of the kiln. The wood is piled horizontally, and packed as closely as possible.

With ordinary facilities, it takes four to five men one day to fill a 45-cord kiln with wood four feet long. Where butt-ends of logs are used, it takes 12 hours to fill a 35-cord kiln; but these can be tumbled in, and do not require much handling.

It takes from five to six days after all the vents have been closed to cool a kiln of from thirty-five to fifty cords. The covers of the doors are of sheet iron, and so long as there is any heat in the kiln it will be felt on these doors. As soon as these are cold, the kiln is cool enough to draw.

Height to spring of arch.....12 feet
Capacity in cords.....50
Number of thousand brick.....31
Number of Vents.....176
Pounds of cast iron.....1500
Pounds of wrought iron.....1500

The chief objection to the rectangular and round kilns is their want of stability. The rectangular kilns require to be braced with wood and iron, while the circular kilns, which offer no advantages over the rectangular, must in addition be hooped with iron. This makes this kind of structure expensive in the first place. The less expensive structure, Fig. 5, does not last much longer. The contraction and expansion which the bracing is intended to prevent does take place, and after a time there will be numberless air-channels in the shape of cracks in the walls which can not be effectively closed, which will both increase the difficulty of management and decrease the yield in charcoal.

Kilns of this shape are being rapidly given up. It has been found much more economical to construct and to manage small conical kilns than large round ones, and these conical kilns are gradually taking the place of the large ones of other shapes.

Patent Life-Saving Respirator.

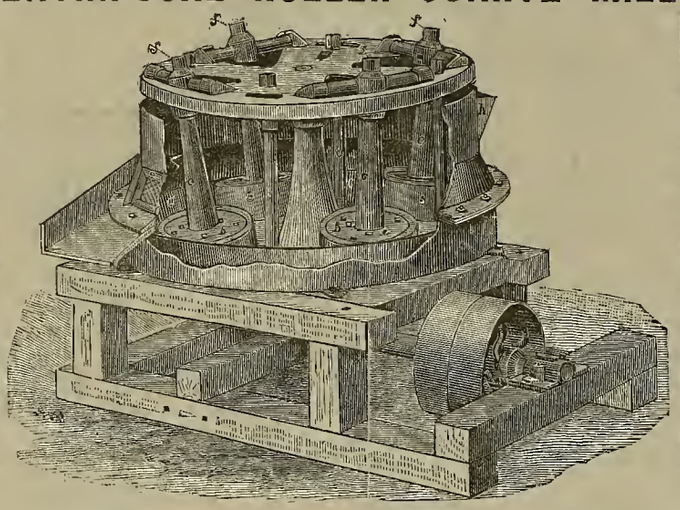
PREVENTS LEAD POISONING AND SALIVATION.

Invaluable to those engaged in dry crushing quartz mills, quicksilver mines, white lead corroding, feeding thrashing machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poison us vapors. The Respirators are sold subject to approval after trial, and, if not satisfactory, the price will be refunded. Price, $3 each, or $30 per dozen

Address all communications and orders to

H. H. BROMLEY, Sole Agent,

43 Sacramento Street, San Francisco, Cal.



REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half ounce), 10 cts.

F. A. HUNTINGTON,

No. 45 Fremont Street, San Francisco, Cal.

CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is a far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Cruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

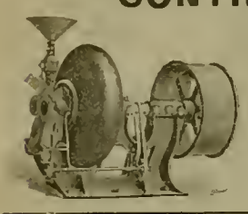
Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.



CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

THE MOREY & SPERRY MINING MACHINERY COMPANY,

Successors to MOREY & SPERRY,

—Manufacturers of all Kinds of—

Mine and Mill Machinery

WAREROOMS: 92 & 94 Liberty St., New York.

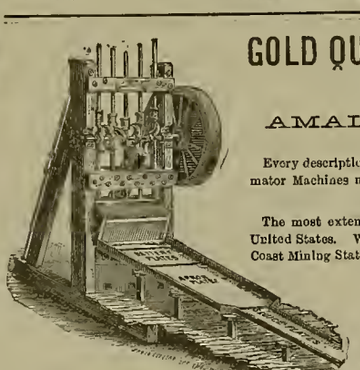
WORKS: Newburg, - New York.

The Foundry and Machine Shop having been enlarged we are now prepared to make from the most improved patterns QUARTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.



SIMPLE, EFFICIENT and DURABLE

The Balls revolve **Horizontally** without friction. 5 ft. size, weight 7,000 lbs., and does more work than 15 Stamps, 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating Pans and Separators, Roasting Furnaces, Hoisting and Pumping Machinery, Engines and Boilers, any size required, Hydraulic Giants and Pipe, Ore Cars, Ore Buckets, Safety Cages. The Hand Power Two-stamp Mill weight 280 lbs. THE EUREKA WIRE ROPE TRAMWAYS, Concentrating Riffles for Mills and Hydraulic Sluices.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

California Wire Works.

Description of the New Factory and Plant.

The manufacturing shops of the California Wire Works are located near the seawall at North Beach, and occupy an entire block of land, bounded by Bay, Mason, North Point and Powell streets. Old Meiggs' wharf used to run through the center of their property, but, with the exception of a small portion of the old wharf that is about to fall to pieces from decay, there is nothing to point out the long pier built by Harry Meiggs, who at one time was so famous in Peru and Chili as a railroad-builder.

The California Wire Works bought the property in September, 1882, and in October commenced to build the foundations for their warehouses and factories. All the foundations are of concrete, of which there are over 50,000 cubic feet. The ground here has been filled in to the depth of twenty feet, below which is the hay sand and mud. Although the ground is generally well filled in, some spots were encountered which had been filled with tin cans, old boots, shoes, etc., and which involved a broad base of concrete, placed at considerable depth, in order to secure a good foundation.

Water.

The consumption of water for the use of the wire mill is very great, and at the old works was an item of considerable expense. In order to provide an ample supply, two artesian wells were sunk with good results, and a satisfactory amount of water secured at a depth of about 100 feet. A beautifully working pump made by Goss & Dow is used for pumping the water to a tank containing 20,000 gallons, placed on a tower 60 feet above the ground.

The Chimney.

In providing the foundation for the chimney, which is 100 feet high above its foundation and 11 feet 10 inches square at base, it was not deemed advisable to go very deep into the crust of filling which lay on the bay mud and sand. The filling at this point was of a very solid and compact nature; consequently, a concrete foundation was provided 16 feet square by 6 feet in depth, on which the brick chimney was erected, giving a load of about 1½ ton to the square foot. The settling took place quite uniformly, and to the depth of 4½ inches. From measurements made with a fine wire, suspended from the cap of the chimney and inside the flue, it was found that the deflection caused by the heat of the sun shining on one side of the chimney was three-fourths of an inch.

Boiler Room.

There are four boilers, each 16 feet by 54 inches, with 54 3½ inch tubes each, with ornamental fronts, and fitted with smoke-consuming apparatus and all the most recent improvements. The boilers are well planted, in carefully built brickwork, and can be reached equally well front as rear, and well lighted all around. The building is 45x35, entirely fireproof, being of brick and iron.

Engine Room.

A horizontal Corliss engine, 24x48 inches, made by Hinckley, Spier & Hayes, of this city, is bedded on a heavy concrete foundation, and works smoothly and with great regularity. It is nicely finished and well proportioned, and reflects credit on the builders. The fly-wheel is 18 feet diameter, and weighs 23,000 pounds. The driving pulley is 10 feet diameter by 50 inches face, and drives a ponderous treble leathern belt 4 feet wide and 80 feet long. This is the largest leather belt ever made on the Pacific Coast. It runs perfectly true, transmitting 300 horse-power with apparent ease and grace. Mr. H. B. Cook, the manufacturer, states that it took 56 hides to make it, and weighs 938 pounds.

The engine is surrounded by a handsome wire railing, to keep visitors out of danger, and the engine-room, which is 30 by 45 feet, is finished off in natural wood, varnished. It is well lighted, as clean as a parlor, and is perhaps the most tastefully finished engine-room on the Pacific Coast, if not in the United States.

The engine is set up ten feet above the floor, which, as well as the walls, is built of concrete. On the floor are the condenser and pump used in pumping the sea water from the bay beyond the seawall, where it is clean and pure, to the heater in the engine-room, where it serves the double purpose of condensing the exhaust steam and supplying the new salt water swimming baths with hot salt water. About 18,000 gallons of salt water are pumped every hour, through a cast-iron pipe ten inches in diameter and 1,300 feet long, by a very smoothly working Dow pump. A similar and independent pump is used to drive the salt water after it has been heated, to the swimming baths.

Machine Shop.

Leaving the engine-room, we pass into the machine shop, 45x100 feet, the most admirably lighted of any shop of the kind we have ever seen. It is well equipped with a great variety of lathes, planers, shapers, drilling machines, bolt cutters, etc.; and the general arrangement of the shop with respect to light, disposition and care of tools, is very creditable to the master mechanic of the works, Mr. J. H. Neil, under whose supervision all the machinery of the company has been erected. From the machine shop we pass into the blacksmith shop, in which are the fires and forges, and where much of the heavy railing-work made by the company is done.

The Carpenter and Pattern Makers' Shops

Are immediately over the machine shop, and adjoining the latter is the pattern room, fitted up with shelving full of patterns, these together occupying a space of 45x120 feet.

Wire-Working Department.

Passing over a bridge, we entered the wire working and wire weaving departments. The former occupy a room 40x215 feet, and the latter a room 19x90 feet. Here we saw wire worked up into every conceivable shape—massive gates and guards for prisons and insane asylums, and delicate flower baskets for a lady's conservatory; large summer-houses and aviaries, and small mouse traps and trap cages—every conceivable kind of ornamental garden work, fire fenders and floral designs.

Wrought and cast iron railing is being made a specialty; and there are here a great variety of special tools employed in the manufacture of railing. Many of the designs are entirely new, while others are taken from samples of work done in the 15th or 16th century.

The wire and iron working department gives employment to a great many boys, who are learning a trade at which they will be able to earn a good living. In an adjoining room are a quantity of looms used in weaving all kinds of wire cloth. Some of them were at work on heavy cloth or screen with holes three-fourths inch square, and made from wire three-sixteenths inch thick, while others were weaving cloth from fine brass wire, and having 3,600 holes to each square inch.

Wire Rope Factory.

The next place we visited was the flat-rope sewing department. Here are manufactured the long, massive flat wire ropes used for hoisting ore from the deep mines. The manufacture of flat rope requires great care, in order to secure uniformity of strain on each of the strands and make the rope run straight and even.

The main rope factory, where the wire is spun into strands and the strands into rope, occupies a building 275 feet long by 40 feet wide, and is filled with very ingenious and somewhat noisy machinery, all of which is the invention of Mr. A. S. Hallidie or his brother. A rope has just been manufactured 22,000 feet long, in one piece, one and five-sixteenths inch diameter, and weighing nearly 60,000 pounds. It is intended for the Market Street Railway Company, and is the longest and the heaviest rope ever made in or brought to this city. We also saw a fine cord being made which measured one-sixteenth inch diameter, and in which were forty-two wires as fine as a lady's hair; and when we compare this little cord with the massive rope before mentioned, it will give some idea of the range in wire-rope making. We ascertained that in the former rope there were 2,636,400 feet of single wire (nearly 500 miles) 1-14 inch diameter, and capable of sustaining a load of 1,200 pounds.

Great attention has been paid to the manufacture of wire cables for street railways. Mr. Hallidie naturally watches with a jealous eye all such ropes, being naturally anxious that the success of his invention of cable railways should not be impaired by imperfect cables. At this time the wire-rope department is engaged in manufacturing steel-wire cables for the Clay Street Hill Railroad Company, 11,000 feet long; for the Presidio and Ferry Railroad Company, 13,000 feet, and for Geary Street Railroad Company, 16,500 feet, besides many other ropes for mining purposes.

Barbed Wire-Fence Making

Is carried on in an adjacent building, and we were shown the *modus operandi*. This part of the business of the company is stopped at present, owing to the dispute between the owners of the patents and licensors, Washburn and Moen Mfg. Co., and the licensees. They have facilities for making fifty tons per month, and expect to start up again very shortly.

Wire Mill.

All the different branches of manufacture of the California Wire Works, as well as the demand from outside sources, are supplied with wire from the wire mills of the company, which are situated adjacent to the other works; and they have been constructed with the utmost care.

All the wire is drawn cold, through steel dies having holes in them of the proper size and form needed for the purpose, and in order to fit the solid iron rod for drawing down, it has to be carefully annealed; and afterward all the oxide and scale are removed by acids. The rod is then covered with a gelatinous coating, and is ready for the wire drawer.

The machinery is very massive, the driving shaft being 6 inches diameter. There are 8 different trains of revolving blocks used for drawing wire, containing 236 blocks, and the capacity of the mill is 400 tons per month. All sizes of wire are made, from ⅜ inch to 1-140 inch thick.

The wire made at these mills is principally from Bessemer and Siemen Martin steel, although a great deal of Swedish wire is also drawn. The tempering and annealing is done in furnaces specially built for the purpose, of the most approved plan; and after the wire is cleaned with acid, the acid has to be all evaporated from the wire, which is done in a drying and baking house of brick. All the lifting of the wire and rods is done by hydraulic cranes, and every thing is provided that modern practice permits, to save labor.

The general design of the works was made with a view to compactness and completeness, and the engineering details and designing has been done by the company's engineer and draftsman, Mr. A. Grutter, in a manner eminently satisfactory to the Board of Directors.

Galvanizing works are being erected on the company's property on North Point street, for the purpose of galvanizing much of the wire produced at the company's mill, and a foundry is being constructed on the Powell street side of the property.

Warehouse.

The large fireproof warehouse of the company occupies almost the entire length of Mason street between Bay and North Point streets. It is 235 feet long by 40 wide, two stories, built of brick and iron. There are about 1,500 tons of merchandise in it at present, besides this warehouse are sheds, in which are stored about 700 tons additional. The company has 1,500 tons of steel rods on hand, from which to make wire, and about 500 tons on the way.

The stockholders have paid in $500,000, and judging from the buildings, plant, real estate, and material on hand, they must have a good deal more than that invested in what promises to be one of the leading and profitable industries of the Pacific Coast, furnishing employment to 150 men, many of whom earn as high as $30 per week at piecework. Of these over 100 are men of family; consequently it is safe to assume that the industry gives bread to 550 souls.

Testing Room.

Before any wire is put into the hoisting rope or railroad cable, it is very carefully tested for tensile strength, torsion and bending, and in a room set apart specially for the purpose there are machines and apparatus specially made for the purpose. While there we saw several wires undergo the ordinary test, which seems very thorough and exhaustive.

Fire Protections.

The provisions against damage by fire are very complete. Four-inch mains run all around and through the grounds. There are six fresh water and six salt water hydrants in convenient locations. A tank of 20,000 gallons supplies the fresh water pipes, and from the four mains smaller pipes are run throughout the works, and have fire-cocks and hose always ready for use. The water supply has a head of sixty feet. The salt water supply is taken from the bay by means of a ten-inch main and a very heavy fire pump, which throws one six-inch stream or four three-inch streams with tremendous force. A one and a fourth stream was thrown over the chimney, 100 feet high.

IF YOU want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. CO., for "Lubrice." It is the best compound-grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

TRUE Temperance

Is not signing a pledge or taking a solemn oath that cannot be kept, because of the non-removal of the cause—liquor. The way to make a man temperate is to kill the desire for those dreadful artificial stimulants that carry so many bright intellects to premature graves, and desolation, strife and unhappiness into so many families.

It is a fact! BROWN'S IRON BITTERS, a true non-alcoholic tonic, made in Baltimore, Md., by the Brown Chemical Company, who are old druggists and in every particular reliable, will, by removing the craving appetite of the drunkard, and by curing the nervousness, weakness, and general ill health resulting from intemperance, do more to promote temperance, in the strictest sense than any other means now known.

It is a well authenticated fact that many medicines, especially 'bitters,' are nothing but cheap whiskey vilely concocted for use in local option countries. Such is not the case with BROWN'S IRON BITTERS. It is a medicine, a cure for weakness and decay in the nervous, muscular, and digestive organs of the body, producing good, rich blood, health and strength. Try one bottle. Price $1.00.

DELINQUENT SALE NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, Cal.; location of works, Drytown, Amador county, Cal.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 4) levied on the 27th day of September, 1883, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Martin, A, Trustee	34	5,000	$500 00
Martin, A, Trustee	35	5,000	500 00
Martin, A, Trustee	38	5,000	500 00
Martin, A, Trustee	42	5,000	500 00
Martin, A, Trustee	43	10,000	1,000 00
Martin, A, Trustee	48	2,900	290 00

And in accordance with law, and an order of the Board of Directors, made on the 27th day of September, 1883, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, No. 224 California Street, San Francisco, Cal., on MONDAY, the 19th day of November, 1883, at the hour of 1230 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of the coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through the SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Addresses, Business letters should be addressed and drafts made payable to DEWEY & CO.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

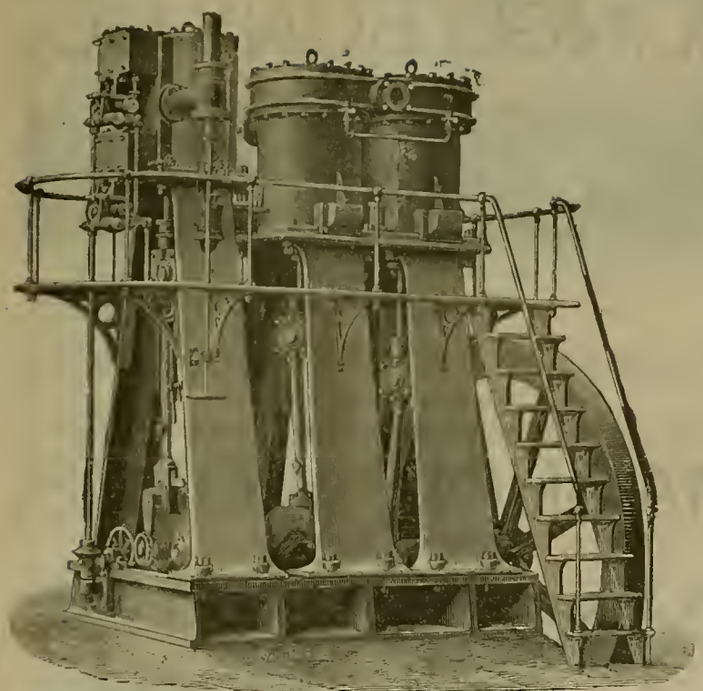
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting togather, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.



WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

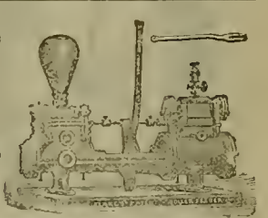
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.



The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

Blasting in Mines—No. 15.

Explosive Gelatine.

Nobel's latest invention, explosive gelatine, something stronger than even the strongest dynamite or giant powder, is a substance of which little is known on this Coast, as yet, though the Giant Powder Company own the patent rights. It is, as the name implies, a compound of nitro-glycerine and gelatine. The gelatine will take up some 95 to 96 per cent of the nitro-glycerine. In this form it is a rubber-like substance, soft and pliable, and is made up into cartridges of cylindrical form ready for use. These cartridges are rolled up in oiled paper, and may be handled like ordinary cartridges. As little is known here of this powerful explosive, it will not be out of place to quote from the reports of the engineers of the great St. Gotthard Tunnel, in Switzerland, some data about the relative strength of some of the high explosives manufactured under Nobel's patents in Europe. This information is from official sources.

In most of the numerous tunnels of the St. Gotthard railroad explosive gelatine was used, after once its superiority was established. Careful investigations were made about the relative value of either explosive, with the following results:

In the Pfaffensprung tunnel—one of the circular tunnels in which the hardest granite on the whole line was met—one cubic yard of rock required, in the lower heading (cross section, 8'x9'), 5.5 lbs. of dynamite. In the same lower heading (cross-section, 8'x9') 3.8 lbs. gelatine. In the upper heading (cross-section, 9'x9'6") 3.1 lbs. of dynamite. In the same upper heading (cross-section, 9'x9'6") 2.1 lbs. of gelatine; which shows that the quantities required have the proportion of explosive gelatine: Dynamite = 1: 1.43.

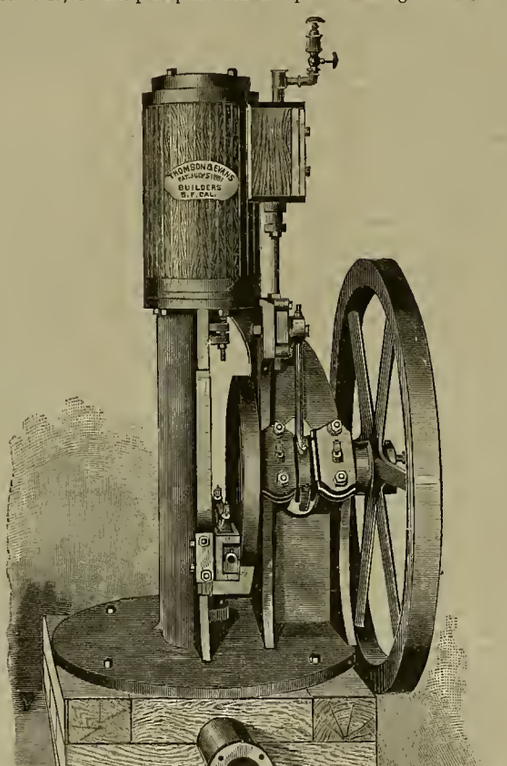
In the great St. Gotthard Tunnel (9½ miles long) one cubic yard of rock required (cross-section of advance heading 8'x9') 6.4 lbs. of dynamite, but only 4.2 lbs. of explosive gelatine, which is a proportion of 1: 1.51.

Mr. Bossi, the chief engineer of the contractor of the great tunnel states, that where 1 lb. of explosive gelatine was sufficient to produce a desired effect, it required 1.10 lb. of pure nitro-glycerine, or 1.50 lb. of dynamite No. 1, or 2.15 lbs. of dynamite No. 2 or No. 3, or 4.50 lbs. of common black powder.

The experience of the engineer in charge of the Freggio Tunnel—another of those circular tunnels of the St. Gotthard railroad, about 5,000' long—was, that explosive gelatine was from 1¼ to 1½ times as effective as dynamite No. 1.

The French engineer Moreau states that, according to his experience, by the use of explosive gelatine 20 per cent of labor was saved and 15 per cent in time was gained.

The general result of a three years' experience in the use of explosive gelatine on the St. Gotthard railroad was, that, under the circumstances, the use of dynamite is 13 per cent and use of black powder 18 per cent more expensive in driving advance headings of tunnels than that of explosive gelatine. Explosive gelatine is more difficult to explode than dynamite, requiring 3.5 times greater force, which makes the use of the former safer than that of the latter. To explode gelatine a primer of dynamite is used with triple-force caps. Both dynamite and gelatine freeze at a temperature of 43 degrees F.; but, while frozen dynamite is more difficult to explode, frozen gelatine is easier exploded, but still more difficult than dynamite not frozen.



If slowly heated, dynamite explodes at 356 degrees F.; explosive gelatine only at 379 degrees F., or when very quickly heated at 414 degrees F. Explosive gelatine is entirely indifferent to moisture; even when submerged in water for several months it does not lose anything of its effectiveness. It changes its color, however, to a milky appearance, which it loses again when exposed to the atmosphere. As great a pressure as 14,000 lbs. per square inch was not sufficient to press any nitro-glycerine out of the gelatine, which proves that the two ingredients of gelatine—nitro-glycerine and gun-cotton—are chemically combined, and not only mechanically. This fact has been established by a commission appointed by the Austrian government.

By a large number of carefully executed experiments made in the presence of the committee of the Austrian Society of Architects and Engineers, it was demonstrated that explosive gelatine is 59.1 per cent stronger and more effective than dynamite No. 1, while its economical value is 49¼ cents to 31⅛ cents, the value of the latter.

This substance is now being made on this Coast by the Giant Powder Company, Bandmann, Nielsen & Co., agents, who are furnishing it to miners and others who have to deal with unusually hard rock.

Fluorspar.

Fluorspar is found in more or less quantity in almost every state and territory, but not very frequently in workable quantity. No statistics of production are accessible, and the estimates of dealers vary widely; but the amount annually mined is very considerable, possibly reaching, according to Williams, 8,000 net tons per annum. Fluorspar is used as a flux, and as a glaze in the pottery trade, and in the production of hydro-fluoric acid, for etching on glass. The greater part consumed in this country is from home sources, little now being imported. Its spot value ranges from $10 to $20 per ton.

CRANK AND FLY-WHEEL MINE AND WELL PUMP.

Indiana and Ohio are said to lead in point of production. New York, Delaware, New Hampshire, and Kentucky also, have fluorspar in noteworthy amount. Fluorspar occurs massive in wide metalliferous veins near Bear Creek, Jefferson County, and James Creek, Boulder County, Colorado. The green, white, pink and purple colors are common, and often all the colors occur in a single specimen. The mines at Bear Creek have produced some 600 tons of fluorspar, but the supply from that place is exhausted. On James Creek the veins of fluorspar are undeveloped, as there is no demand for it as a flux. Fluorspar occurs frequently in the ores of Montana, Wyoming, Colorado and New Mexico, but only in small quantities. It is used as a flux in local smelters, but is not much in demand. Fine cabinet specimens come from Crystal Park, some showing crystals ten inches across.

The Manufacturers' Association.

Several meetings of the "Manufacturers'" Association of the State of California" have been held since the preliminary one of October 29th, and arrangements are pretty nearly completed for commencing active work. Incorporation papers have been filed in which the objects of the Association are stated to be "The encouragement, fostering, promoting and improving the manufacturing interests of the state of California, and more especially those belonging to members of the Association; to acquire the property necessary to carry on the business, etc."

A meeting of the Association was held on Monday last, when the following gentlemen were present: Messrs. Harney, Hecht, Haraszthy, Garratt, Doble, Phelps, Kerr, Hallidie, Scott, Savage and Spaulding. Mr. Irving M. Scott was in the chair. The main business of the meeting was consideration of the by-laws. The committee reported a set of by-laws which were, after some amendments, adopted. Another meeting will be shortly held, and active steps will be taken to enlarge the membership.

Double-Acting Pump for Wells and Mines.

The engraving on this page illustrates the Thompson & Evans double acting pump, for artesian wells and mines. It is a double-acting force-pump and direct-acting engine, with yoke and sliding block attached to crank, and is automatic in its workings. This form of pump has been in use some time, and proven its practical utility by everyday work under varying conditions. These engines are at work at the Original Keystone mine, Silver King mine, Arizona, and the following places in this city: Phelan's building, Fair's building, Geary street railroad house, Golden Gate woolen mills, Bay View distillery, Electric Light works, Hammam baths, Baldwin gas works, Pioneer woolen mills, The Hertel, the Artesian and the Shipley water works, the California sugar refinery, etc. The machine is strongly made, durable and reliable. Thompson & Evans, 110 Beale street, in this city, are the makers. Persons inquiring about these pumps should state size of well, number of gallons of water required per hour, depth from which water is to be taken below the surface, and height it is to be raised above the surface.

The Commissioner of the General Land Office has decided that El Sobrante reservation in California was confined to the land lying between the five surrounding ranches, exclusive of their surplus. The decision dismisses the claims made by certain persons to the lands near Oakland, California. He also decides that the lands between the Moraga and San Ramon ranches became public land in 1866.

It is stated that under the new arrangement by which it withdraws from California business the Northern Pacific railroad is to receive from the other routes a bonus of 20 per cent on their net earnings upon San Francisco business, which is equal to over $500,000 per annum.

The dividends of the Horn Silver have been reduced to $200,000 per quarter. Heretofore the stockholders have been receiving $300,000, hence the decline in stock from $7 to $5.

CORRESPONDENCE.

English Investments in Pacific Coast Mines—No. 7.

[Prepared for the MINING AND SCIENTIFIC PRESS, by H. DEGROOT.]

Richmond Con. M. Co.—(Limited)—Locality and Early History of the Property.

The mines and reduction works of this company are situated near the town of Eureka, Eureka County, state of Nevada. Originally, the claims which constitute this property consisted of the Richmond and the Tip-Top, to which several others, through purchase, have since been added. Although ore was discovered in this district, and the Richmond claims were located as early as 1865, not much effective work was done there until 1869, the efforts previously made at smelting the ore having failed of success, by reason of the imperfections of the furnaces put up,and the inexperience of those engaged in the business. In 1871 a small circular furnace was erected here, and with it such an amount of bullion turned out as conclusively proved the great value of the mine. The same year Mr. Jos. M. English bought the property, and immediately afterwards disposed of it to the Richmond Consolidated Mining Company (Limited), of London, England, which had been organized with a view to buying it.

Plant and Other Improvements.

This English Company, having ample means, proceeded at once to open up the mine in a thorough and systematic manner, erecting the following year such additional buildings as were required, and two more furnaces, with a smelting capacity of 50 tons per day each. Other improvements would at this time have been made but for an adverse claim that was sprung on the company, involving the title to some of their ground. This controversy was finally settled by their buying the Tip-Top location, the ground in dispute, and which has since proved to be of large value. This trouble disposed of, the company, on the 24th day of May, 1872, commenced operations with their new furnaces, which, planned and constructed by an experienced metallurgist and smelter, did their work well. From that day to this the Richmond Company have pursued a career of almost unexampled prosperity, the large and profitable production of bullion, commenced over twelve years ago, having since been continued, without interruption, and up till the past two years, without suffering material abatement.

The plant of this company consists at the present time of four smelting furnaces of large capacity, powerful steam hoisting-works, and a large and well appointed refinery, whereat the gold, silver and lead are separated, the precious metals refined, and the lead converted into merchantable shape before being shipped to market. A railroad, two and a half miles in length, has been laid down for transporting the ore from the mine to the furnaces. A foundry and machine shops have been built, enabling the company to make all the castings and most of the machinery required in the prosecution of their business. The improvements made here are all large, substantial and first-class throughout, the furnaces being of the water-jacket style, and the refinery, foundry and machine shops equipped with implements and appliances of the most approved patterns.

The Richmond Ore

Consists of a tractable argentiferous galena, the most of which carries the fluxes necessary to its ready reduction by smelting. During all the more prosperous history of the mine this ore assayed, on an average, metallic values to the amount of $60 per ton. For the past two or three years it has been diminishing in value, and last year averaged only about $44 per ton. Formerly, it yielded from 20 to 30 per cent lead, from four and a half to five tons of ore making one ton of base bullion. At present, it yields hardly more than 12 per cent lead. The precious metals consist of about one-third gold, and two-thirds silver.

Product and Dividends.

The value of the bullion turned out by this mine to date—gold, silver and lead included—amounts to $15,000,000, of which about $4,000,000 have been disbursed to the shareholders in dividends. Sixty thousand tons of refined lead have been produced at the works of the company.

The capital stock of this company consists of $1,350,000, divided into 54,000 shares, of the par value of $25 each. These shares are now quoted on the London market at $30, making the current value of the property $1,620,000. The net earnings of the mine amount to more than three times the capital stock of the company and to more than five times as much as they originally paid for the property.

Exploratory Work.

The developments made on this property are very extensive, consisting of shafts, tunnels, drifts, uprises, winzes, etc., every manner of subterranean excavation practiced in deep mining being here met with, whether driven for working or prospecting purposes. Immense chambers have been stoped out, and miles of exploratory drifts run in various directions, a vast amount of dead work having been performed during the past few years. The mine has now been opened up to a depth of 1,050 feet, and although the best portions of the large ore bodies formerly developed have been exhausted and no new ones of much importance have since been struck, the directors of the company, in their report for the year ending Feb. 28, 1883, state that bunches of good ore had lately been discovered in various parts of their ground, and that they hoped soon to reach larger and more valuable ones, indications pointing strongly to such result.

A Good History, Despite Some Fault Finding.

The management of this mine has sometimes been adversely criticised, the conduct of the superintendent in the field having been made the subject of severe strictures in certain quarters; but these attacks have generally been inspired by mercenary motives, their object having been to depreciate the shares on the London market. The record made by those in charge on the ground, as well as by the home management, is their sufficient vindication.

In regard to this mine and its vendor, the *Daily Report*, of San Francisco, has this to say in a recent issue:

"Every thing considered, we suppose that to the Richmond Consolidated mine, at Eureka, Nevada, must be awarded the merit of having made the best record of any mine west of the Rocky Mountains. Some mines on the Comstock have, it is true, produced more bullion, and declared a larger amount of dividends, but this was the result of forced and spasmodic efforts, which soon exhausted the stock of ores and demoralized the market, enriching the few, while it impoverished the many who had confided in the resources of the mines and the honesty of their management.

Very different has it been with the Richmond Consolidated. Sold in London some twelve years ago at a moderate price, the mine, afterwards opened up with skill and thoroughness, equipped with a first-class plant, and managed wholly in the interest of the stockholders, has returned to them in dividends its original cost many times over. From the time they commenced being paid in 1872 to the present time there has been no intermission of dividends, these amounting in the aggregate to something like $3,000,000. The shares of this company command now a premium of thirty per cent, their property being to-day one of the most valuable in the whole country.

The credit of placing this mine on the London market is largely due to Joseph M. English, one of our leading mining proprietors, and formerly a resident of San Francisco. To this gentleman is due the further credit of having sold in London the Sweetland Creek Hydraulic estate, the first mining property on this Coast to return dividends to British investors. It, too, proved in every respect a prosperous enterprise. Two years ago Mr. English sold to Boston people the Napa Con. quicksilver mine, of which he was principal owner. The large net earnings which this property has since made it seems likely to keep for an indefinite period, immense bodies of high-grade ore having lately been developed in the mine. In all his mining ventures, whether as operator or owner, Mr. English seems to have been singularly fortunate, there being, it is said, no failures to be recorded against him."

The compliment here paid Mr. English is well deserved. The good judgment displayed by him in the selection of properties for the English market, and his honorable methods in dealing with foreign investors, are certainly to be commended; but the report is a little at fault in some of its figures. The net earnings of the Richmond mine, instead of $3,000,000, should have been set down at $4,000,000, as already stated; moreover, we are of the opinion that several other mines might be named that have made as good a showing as the Richmond; the Idaho, in California, and the Ontario, in Utah, for instance, not to mention several others that in some respects can point to an equally good record.

TROUT AS A MILLING PROPOSITION.—A curious incident took place at the Mexican mill day before yesterday, says the Carson *Appeal*, which may be set down as a fact, for it is vouched for by half a dozen mill hands. About 3 o'clock in the afternoon John Moran, one of the workmen, noticed something wrong in the batteries, and the machinery was stopped. It was discovered, much to the astonishment of Superintendent Williams, that mixed up with the Belcher ore was a conglomerate mass, which, on inspection, proved to be brook trout. An investigation showed that the screen leading into the mill race had been broken, and with the rise in the Carson River the trout had swarmed in, and on account of the force of the water found it difficult to get back, as in their endeavors to shoot the rapids they generally missed the hole and struck the wire. The supply pipe, which furnishes water for the batteries and pans, was of sufficient size to allow the passage of the fish, and they were shot into the batteries and reduced to pulp. Mr. Williams also found over a hundred trout in the mill race too large to go down the pipe. The trout are now very thick in the river, and there is fine fishing in the vicinity of Empire. A wire screen has been placed over the mouth of the pipe, and now the fish do not interfere with the batteries.

Investments in Mexican Mines.

The current of speculation has for several years past set violently towards Mexico; but unless the mysterious laws which seem to regulate finance be revised, the tide will ebb as strongly as it has flowed. The result, as it affects mining, will be a suspension of the most legitimate projects, as unreasonable as has been the crazy confidence with which money has been thrust upon the dishonest and ignorant promoters of the most extravagant delusions. It is not to be wondered at that Mexican mining schemes should receive support, appealing so forcibly as they do to the imagination of the purchaser, and affording, as they believe, such unlimited scope for the play of the imagination on the part of the seller. Mexico has produced $3,000,000,000 of silver, and still pours forth $30,000,000 annually. The inference that mere common sense might draw from the first figures would be, that, in the nature of things, there must be little left in store whence so much has been taken; but the second figures contradict this conclusion. Nevertheless, as preference is given to the one line of argument or the other, will capital be refused or granted for the more important and costly mining claims.

The enormous output of the past affords, undoubtedly, when coupled with the large output of the present, proof positive that the wealth which Mexico inclosed within her mountain ranges is by no means exhausted; but it does not necessarily prove that the old mines whence this wealth was extracted will pay if rehabilitated. Some perhaps will, some certainly will not. The history of the last days of some, if it reached the ears of the investor, would determine him to keep his money in his pocket. The facts ascertainable about the closing scene of others make it justifiable to risk heavily in reopening them; but the same romantic story is told in almost every case of rich ores which the imperfect Mexican method failed to beneficiate, but from which Yankee machinery will extract their full value; of revolutions which depopulated the region, and therefore closed the mines; of water which flooded them in the face of the puny appliances with which the Mexicans fought it; of rich workings closed because devils haunted them or priests cursed them, and so on and so on.

It is unquestionably true that mining was often checked, and some good mines closed, as one of the baneful results of revolutions; it is equally true that the horse-whim failed to cope with the water; and that in many cases good mines could not find capital to pay for steam-pumps. But it is not true that Mexican metallurgical methods are both costly and defective, and that all old mines were killed by external violence rather than by internal disease.

What is too generally true is, that an unscrupulous man, with ready wit and a glib tongue, goes south to Mexico, either denounces abandoned mines or buys an old languishing one for a trifle, concocts his romantic tale, and sells the history and the mine in the north for as many hundreds as he expended units. What follows is perhaps the necessary corrollary of the first act of folly. As the valuable mine was abandoned because its ores would not yield to Mexican treatment, therefore, American treatment must be applied, and a mill built; but as amalgamation failed in the Mexican *patio* process, therefore leaching must surely be the thing, and accordingly a roasting furnace and tubs are put up. Skill to conduct the operation is the last thing thought of. Already the cost has far exceeded the estimates, and economy must be practiced; and as usual, economy at this point means cheap management. A director of a Mexican company boasted how admirably they saved the salary of a metallurgist. They had employed a man at a figure high in their estimation. He was taken mortally ill on his way south, and arrived at the mine a doomed man; but during the few remaining days of life, the superintendent tortured him into imparting all he knew, and that so effectually that when death released his victim the inquisitor felt himself to be a fully equipped metallurgist, and competent to run the leaching-works. How the leaching-works succeeded need not be told. A clever fellow christened Parral, the Leadville of Mexico. The misnomer created a smelting plant big enough to reduce in one day all the lead ores Parral could produce in a twelve-month. But, whoever lost the money, the epigram writer probably did not. A still cleverer man discovered, by a *priori* reasoning, the existence of tin in Durango some centuries after it had been worked. He described a course through Cornwall, Queensland and Penang, and, projecting it across the American continent, the line struck Oregon. His subsequent application of the experimental method in Oregon showed no tin there. So he revised his chart, and the curve fell on the Conito tin field of Durango. Perhaps, after all, his first isostannic line was the correct one; for had he continued it across the continent, it might have led him to the tin fields of the Black Hills and Alabama. Such charlatanism is not confined to Mexico; yet it seems to be most seductive when practiced on minds already predisposed to believe the marvelous, as most people are when they invest in foreign mines.

The records of the great mines of Mexico are matters of history. The condition of some of those mines below water-level is only matter of tradition. To put into working order such mines as Sombrete and Fresnillo will admittedly cost hundreds of thousands of dollars. Those who decide to resuscitate these great enterprises do so with full knowledge of the facts and of the risk they run. They know the fate which befell so many similar enterprises in the hands of Englishmen, sometimes through palpable mismanagement, at others through the poverty of the mines; but they count in their favor the accessibility which railroads will give to their property, and the salutary effect of closer supervision on their superintendents, and they depend for dividends on the cheapness with which the railroad enables them to equip their mine and mill with efficient machinery. We admire the courage of these adventurers, and every one interested in mining wishes them the rich reward they deserve. But no sympathy is due to the sufferer who has eagerly swallowed the fly decorated by some promoter with ridiculously gaudy feathers. Correct and honest information is within the reach of every investor, if he is willing to pay for it. He only offers a premium to dishonesty by investing his money without inquiry. Of this he may be pretty sure, that, as the Mexican is a good miner and a good metallurgist, if he abandons a small, shallow mine, his doing so affords strong presumptive evidence of its worthlessness. The Mexican does not conduct his underground operations on the same system, and does not break down ore from large veins as cheaply and with as little damage to the mines as we do; but he can trace with unerring instinct the course of the rich ore, and he removes only what it will pay him to treat. There may be some profit in mining and milling his leavings; but the profit will generally be scanty. Another fallacy which enters the stock in trade of a Mexican promoter is, that we can always make profit out of ores which the Mexican, with his clumsy method of treatment, has to reject. In certain localities, this is true; but it is by no means always so. At points near the railroads, we can undoubtedly smelt lead and copper ores with coke more cheaply than he can in his little furnaces, so expensive in labor and fuel. But we must recollect that heretofore labor has been one third or one quarter cheaper than it will hereafter be in the vicinity of the railroads, and this will go far to reduce the advantages which cheap freights will give us. But it is questionable whether, in localities where fuel and water are scarce, ore-mill processes and machinery will reduce free silver ores more economically and with less loss than the *patio*. It is of course inapplicable to very base ores, and, in handling these, a leaching process may in some cases be preferable to amalgamation after a chloridizing roast, or to the usual Mexican method of fusion with lead ores and litharge. But it is unwise to start with the assumption that Mexican methods are crude and inefficient, and that we can of course make money where they, in their ignorance and unskillfulness, failed. It is also hardly necessary to contradict the ridiculous stories of the richness of the ores. There is everywhere very rich ore, confined to very small veins or bunches. The average of very large bodies is comparatively low.—J. D., JR., in *Engineering and Mining Journal*.

Miners' Lien.

There is no species of meanness so reprehensible as that of the man who will deliberately contract for labor which he can not or will not pay when properly performed. Mine managers may, on rare occasions, be drawn into such contracts by the well justified belief that the money will be forthcoming at the right time to settle the account; but this excuse can not be justly played by those whose habit it is to default in nearly every instance of the kind, upon some pretended defect in the work, or without any defense whatever. When the hard-worked miner is the sufferer, there is little chance of recovery, and the time is coming when, if the law does not show a better protection, some harsh but summary punishment will be meted out to the rascals who have been pursuing this despicable course in our midst.

We have long felt the need of more stringent laws in this state to meet just such cases as this. Apparently the laws relating to miners' liens are very defective in certain particulars. As they now stand, it is not difficult for shrewd operators to use the time and labor of a dozen or more men to test the vein; then if it does not prove profitable, to abandon it and leave the worthless property to the laborers for their wages. While it is true that the miner is very frequently to blame for making contracts with those whose record for such dealings is notorious, and it is also true of making contracts, still the miner is by far the most frequent sufferer.—*Silverton Democrat*.

SOUNDING SANDS.—About twenty miles south of Stillwater, in Churchill County, on the Sands Springs Flat, at the foot of the mountain, there is a heap of sand about a hundred feet high and nearly a mile across, which sings in the wind and is constantly changing. The Reno *Gazette* says it is thrown by the wind, which there has a circular motion, into a vast wall, with a hollow in the center half a mile across, which goes two-thirds of the way to the bottom. It is steep and hard to climb to the top, and on the inside is even more steep—so steep that no one has ever dared to go down, for fear that the loose sand would slide down and bury him up. There are similar dunes on the Sandwich Islands, on the Hebrides and on the Atlantic Coast. Prof. Bolton, of Trinity College, Hartford, Connecticut, is collecting data in regard to them.

MECHANICAL PROGRESS.

Priming of Steam Boilers.

Suppose a 10-inch cylinder with a 2 inch supply pipe—such ill proportions are to be found in use by some who complain of foaming—and the piston velocity to be at the moderate rate of 300 feet per minute. In such a case the area of the cylinder is just 25 times as great as the area of the steam pipe, and the steam in the pipe must move 25 times faster than it does in the cylinder, or equal to 7,500 feet per minute, which is a little more than 85 miles an hour. With this velocity a lessened density is caused immediately around the mouth of the pipe, and the steam pressure in remoter parts of the boiler forces water instead of steam into the vacuity, just as the atmosphere forces water into a suction injector. If the steam pipe were twice the area, steam would have only half the velocity, and so in proportion. It is not the amount of steam that is taken that causes priming; it is the velocity, whereby we disturb the equilibrium of pressure in the boiler; and boilers should have plenty of steam room, water space, water level, and width of spaces, to help equalize the pressure; and steam pipes should be proportioned and placed so as to disturb the equilibrium of pressure as little as possible. Taking steam from two or more different parts of the boiler often helps very much.

But dirty water; how does that act to cause priming? I found a satisfactory answer to this question in a very simple way; at least it satisfies me, although others may have a different light. After wondering for years why dirty water should foam any more than clean water, I happened to be in the village drug store when the old doctor himself was tending the soda fountain. One customer took plain soda water; it sparkled some as the gas escaped from it, but there was no foaming. The next man took plenty of syrup in his, and it was all foam. I asked the old doctor why the first glass did not foam like the second one. He said there was more gas, more effervescence in the first glass, but there was nothing but the weight of water to prevent its escape, while the syrup was of a glutinous or adhesive nature, and formed films and membranous cells, which hold the gas from escaping, the whole forming so light a substance that it rose up in what we call froth or foam. Here was the answer to my question. The impurities of the water are adhesive, and form films and cells which hold the steam and yet are carried upward by the steam, and the lightness of the foam makes it easily carried off with the steam even at a moderate velocity of escape.—*American Miller.*

The Progress of Invention.

Like many other human activities, the patenting of new inventions "breaks out in spots." An example of this is found in the recent rapid issue of patents and applications for patents in a very few lines of invention. The first class to be mentioned, which, indeed, is the one that would be guessed by every intelligent reader of the newspapers of the day, is mechanism for the practical use of electricity. A new principle, such as that of converting sound-waves to electrical-waves, on a wire, as exemplified in the telephone, brings after it numerous devices for its practical application. Every great invention is thus followed by a numerous train of subsidiary patents, usually dependent upon it, as all the varieties of the sewing machine, with their many "attachments," were dependent upon the device of a needle with the eye in the point. So the telephone, with its improved transmitters, receivers, switchboards, and devices for "shunting," occupies a large share of the attention of the patent examiners.

Another impulse has been given to inventive talent by one of the whims of fashionable life. Four years ago the number of recent patents on two-wheeled vehicles might have been counted on one's fingers. In October, 1880, two patents of this sort were taken out, followed by others, and now the examiner in that line of conveyances is kept busy looking into the merits of new styles of village carts, with their paraphernalia. For several years past only a small number of applications for fire-escapes have been received, but since the disastrous hotel fire in Wisconsin such applications have been coming in rapidly. It has been said, in a figurative way, that once in his life every man of a mechanical turn of mind invents an automatic car-coupler. The records of the Patent Office, and especially the collections of rejected models, give some color to the saying. In the class of Car Couplings and Driving Carts," 184 patents were granted for July, 1882. For the same month this year 198 were issued.—*Iron Age.*

BLAST FURNACES IN ENGLAND thirty years ago generally averaged from 35 to 40 feet in height. The original "Middlesbro'" furnaces of Bolekow & Vaughan were 42 feet high, with 15 feet boshes. In 1855, Messrs. Cochrane's "Ormesby" furnace was the largest in the district, being 55 feet high, with 16 feet bosh. The height of the furnaces and width of boshes was gradually increased, until 1866, when Messrs. Bolckow & Vaughan erected a furnace 95 feet 6 inches high, with only 16 feet bosh. This furnace, however, proved too high, having regard to the width of the boshes. Furnaces in England are now generally built to a height of from 60 to 75 feet. Two furnaces just erected at the Spring Vale Iron Works, near Wolverhampton, are 60 feet in height, with 21 feet boshes. Cowper stoves are being put up in connection with these furnaces. It is a remarkable fact, as showing the enterprise of the pioneer Cleveland iron masters, that of the 53 furnaces built prior to 1862, only one was in existence (and that out of blast) in 1875, the whole having been rebuilt on improved principles. There are now 909 blast furnaces in England, Scotland and Wales, which are owned by about 190 companies. The Cleveland district has 163 furnaces within its limits, Scotland 144, South Wales 142, North Wales 10, South Staffordshire 116, North Staffordshire 40, and Lancashire and Cumberland 106.

IMPROVEMENT IN THE MANUFACTURE OF STEEL RAILS. A highly important improvement in the manufacture of steel rails, which is likely to still further decrease the already low price of those articles, by dispensing with a considerable proportion of the laborers now employed in the process, is indicated in the following special from Joliet, Ill., to the Chicago *Tribune*, dated October 15th:

A successful process for rolling rails at the works of the Joliet Steel Company, without reheating the ingots in the bloom-mill furnaces, was put in operation to-day. Two hundred and fifty rails were run through, direct from the shears; that is, they were taken from the converter direct to the bloom rolls, and instead of being taken from there to the bloom furnaces, were put at once through the rolls and finished, without losing a rail or sending back a single bloom. It is said that the rails worked just as well and as easily as they do when reheated and taken from the bloom furnace. The process will be adopted, and will throw from thirty to forty heaters, chargers, buggy-men and helpers out of employment, but this will be only a handful compared with the number that will be laid off when the new initial-heat and soaking-pit process is adopted. This will do away with both rail-mill and bloom-mill furnaces, and the one hundred or more operatives that man them, also fifty or seventy-five others engaged in the two extra meltings and heatings now used.

HOW ANNEALING MAKES METALS, ET ., PLIANT.—The annealing of wire, glass and other substances renders them soft, more ductile and less brittle. A substance is annealed by simply heating it and allowing it to cool gradually. Recent experiments have resulted in the conclusion that the heating results in a kind of rupturing or cracking open; and in seeking an explanation of this, it is thought that in bringing the substance—take wire for illustration—suddenly to a white heat, the air held both physically and mechanically in the wire is expanded and exploded, tearing its way out and leaving fissures and cracks all over the surface. These fissures are plainly visible, and assume the torn and ragged appearance that might come from such explosions of the contained air. The wire, before stiff, is now soft and yielding, simply because it is cracked, and bends readily at every break on its surface. To illustrate this we have only to paint a sheet of paper with a gum-like dextrine, or even mucilage; when the paper is stiffened, draw it over a sharp edge and crack the gum, and the paper will bend freely in every direction. Here the cracks are visible, and it is easy to see that they allow the gum to bend. It may, from this, be seen that annealing is a rupturing or cracking of a substance, and that its softness and pliability result from the free play given by the cracks.

ALLEGED LACK OF TECHNICAL EDUCATION AMONG AMERICAN MACHINISTS.—The Philadelphia *Ledger* says that a person who recently advertised for machinists tested the proficiency of all who applied, and remarked, when summing up the qualifications of the men, that, though the Americans pleased him the most by their brightness, the foreign workmen were, without exception, better educated. The Americans had picked up their trades in the shops, but most of the foreigners, in addition to their shop practice, had attended technical schools. The latter could not only do good work with the tools, but they could lay it out, make sketches, and, if necessary, draw the designs to scale. The American shop-taught workmen, though quick to understand, inventive, and skilled in the use of tools, were markedly deficient in drawing and such knowledge of mechanics as is required by the designer and draughtsman. Perhaps there is some truth in the above, but so long as American machinists continue to maintain their supremacy for superior ingenuity, excellence of work, and greater rapidity in its execution, they can afford to spend less time on the minutiæ of the schools. In some cases, where ignorance is bliss 'tis folly to be wise.

THE MACHINERY BUSINESS.—The *American Machinist* says that reports from various sections of the country indicate that, while the machinery business is not so brisk as it was one year ago, there are comparatively few complaints about dullness. It adds the special information that the erection of new car, locomotive and repair shops for railroads is probably greater this year than ever before, and gives a list of such shops erected this year that will employ many thousands of machinists and other mechanics.

SCIENTIFIC PROGRESS.

Another Cheap Light.

M. Soulzee has made another attempt to produce a cheap and brilliant light by the combination of gas and electricity. The arrangement comprises an ordinary gas flame, fitted with a curved metallic rod passing through the flame, provided with means for preventing overheating under the action of the electric current, which is taken from a secondary battery. It is claimed, in a notice of the arrangement given in the *Journal d'Eclairage au Gaz*, that under these conditions the illuminating power is considerably augmented in proportion to the additional expense. The light is also said to be white, and much cooler in respect of radiation than a corresponding light from gas alone, the relative proportion of luminous and heat rays being completely changed. What is supposed to render this combination practicable is the fact that the platinum does not require a great intensity of current, and that "one or two small elements will suffice to supply an ordinary light and make it give four or five times more light at a cost three times less than gas." These are nearly the same data of cost and illuminating power as those to which the public have been accustomed by electricians. It is a novelty, however, to find gas introduced into the combination in this fashion. According as the intensity of the current is increased or diminished, the flame may be rendered luminous or hotter, as the case may be, so that the arrangement is "capable of furnishing all gradations, from the brilliant flame to the most calorific radiations." Here, it is evident, is a gas stove and a light-house in one, and only needing a reliable secondary battery to be capable of use for either purpose.—*Artisan.*

SATURN'S RINGS.—Prof. Kirkwood, in 1868, accounted for the great division in Saturn's rings by the commensurability of the period of a body revolving at that distance from Saturn with the periods of the six inner satellites. Dr. William Meyer, of Geneva, has since investigated every possible combination of the commensurabilities of the revolution periods of the satellites, and finds six other places where a perturbing influence is exercised. The divisions most strongly marked seem to be at places where the commensurabilities are the closest and all the satellites take part. A faint division should be found in the inner bright ring, according to Dr. Meyer. Prof. Holden has noted a distant point at which the shading-off begins in the position indicated by Meyer's theory—a fact which seemed to have escaped Meyer's notice.

Dr. Meyer also gives a new determination of the orbits of six of Saturn's satellites—Eneeladus, Tethys, Dione, Rhea, Titan, and Iapetus. From each of these he has determined the mass of Saturn. The original observations are to appear in the "Memoires de la Societe de Physique de Geneva" during the present year.

Encke's division in the outer ring of Saturn has been examined by M. Schiaparelli, who finds that the position and lack of symmetry are the same as previously noticed, but the line is broader and more diffused than in 1881. He thinks the phenomenon is variable, and accounts for it by supposing the middle of the ring to be thinner, and by the change of orbit of the particles composing it. He also examined carefully the region about the inner bright ring and the dark ring. At times O. Struve's division was seen very distinctly, and on other occasions very faintly. More observations are necessary to determine whether the phenomenon is variable.

A NEW FORM OF DRY-PILE.—A new form of dry-pile has been described in "Wiedemann's Annalen," by J. Elster and H. Geitel. In the previous forms of dry-pile, from the time of Zamboni downward, the disks of foil and paper have been placed in glass tubes, with the result that the film of moisture collecting on the inner surface of the tube has always exerted a more or less destructive influence. In the new dry-piles the disks are strung with a sewing needle upon a single strong silk thread, which insures better insulation. Messrs. Elster and Geitel have made the very interesting observation that piles of this type can be charged from a Holtz machine. An ordinary Zamboni pile of 11,000 pairs of disks of tin and copper foil, gave, after ten minutes' charging, sparks 1mm. long, and was able to illuminate a small Geissler tube for some time with a discharge continuous at first and afterward intermittent. Following up this analogy, dry piles were constructed on the plan of a Plante battery. Thin disks of lead foil, alternating with disks of silk paper painted with a mixture of soluble glass and peroxide of lead, were strung upon silk strings. A charged pile of 7,000 such plates gave for 10 minutes a spark 1mm. long, and after 24 hours still showed electrification.

THE WHITE OF BIRDS' EGGS.—Tarchanoff has discovered that the white of the eggs of those birds whose young are born unfeathered differs from ordinary albumen, its most striking peculiarity being that it remains transparent after coagulation by heat. He designates it as "tata-eiweiss." It differs from ordinary white of egg in many respects. When coagulated it is fluorescent. It has less polarizing power, and contains more water than the white of hens' eggs. It gives no precipitate when abundantly diluted with water. It is at first strongly alkaline, but loses that reaction as the yolk develops. It is rapidly digested. It can be redissolved in water after drying at 40° C. It can be changed into what appears to be identical with ordinary albumen, *a*, by the addition of a few drops of concentrated solutions of neutral salts of alkaline bases, or, *b*, of concentrated ascetic or lactic acid; *c*, under the influence of carbonic acid at a temperature near boiling; *d*, by incubation. Experiments left it uncertain whether the ordinary albumen first passes through the "tata" form. It seems probable that the "tata-eiweiss" is a sodic or potassic albuminate. Tarchanoff, in the course of his experiments, produced yolkless artificial eggs by making fistulæ of the oviduct in hens. They bear the operation well, but it causes atrophy of the glands of the oviduct, and apparently of the ovary also. The mature ova are discharged into the body cavity. Under favorable circumstances, if a ball of amber is introduced into the upper end of the duct, the white with fully developed chalazæ and the membranous shell are deposited, producing a normally formed egg, in which the yolk is replaced by the amber ball. A ligature prevented the descent of the egg, during the experiment, into that region of the oviduct which secretes the calcareous shell.—*Pflüger's Arch. Physiol.*, xxi. 374.

THE JAVA UPHEAVAL.—The recent subterranean upheaval in the vicinity of Java grows more and more appalling as the facts in relation to it become better known and the real magnitude of the disturbance more fully comprehended. The changes in the configuration of the dry land and surrounding ocean bottom are even more extensive than was at first supposed. The London *Nature*, which ranks high as authority on such matters, in its latest issue speaks of the occurrence as follows: "The details which have reached us during the past week of the terrible seismal manifestations at Java prove it to be one of the most disastrous on record; probably, moreover, it is the greatest phenomenon in physical geography which has occurred (at least in the historical period) during the same space of time. It has altered the entire physical geography of the region, and the condition of the ocean bed. The existing charts of the strait (Sunda), with their careful soundings, are useless for purposes of navigation, and when quiescence is restored a new series of soundings will be necessary. Doubtless the results of the outbreak will receive minute attention at the hands of the Dutch government, and when all the data are collected they will form valuable material for the study of the physical geographer."

ARTIFICIAL PRODUCTION OF MINERALS.—Bourgeoise has succeeded in producing wollastonite artificially, by the direct fusion of the proper proportions of lime and silicic acid at a bright-red heat, and allowing the fused mass to cool in the furnace very slowly. Distinct crystals and crystalline masses were obtained, which corresponded entirely in form, though not in optical properties, with the natural mineral. The same investigator also succeeded in producing an artificial meionite, by fusion at a bright-red heat, of lime, magnesia, alumina and silicic acid, in the proportions corresponding to the composition of the natural mineral. De Schulten has produced an artificial analcime, by heating to 350° Fahr., in a hermetically sealed copper vessel, for eighteen hours, a solution containing the proper proportions of sodium silicate and sodium aluminate to constitute the mineral, with the addition of some lime-water to aid the crystallization of the resulting analcime. The resulting crystals exhibited the well known trapezohedral form characteristic of this mineral—the dodecahedron and combination of these two simple forms. The chemical constitution and the optical behavior of the artificial compound corresponded perfectly with those of the natural mineral.

DURABLE MOLDS FOR CASTING.—Doctor Schlagel, of Hoyerwerdaa, Germany, manufactures molds for casting, from clay and brown coal. Pure clay is ground very fine and kept dry for use. The coal is ground to a degree which is variable according to the kind of casting warranted. The clay and the coal are well mixed together, and when the clay is of good quality a mixture of the two in equal proportions will do for most purposes. Chamotte meal may be added to make the mold harder, but is not absolutely necessary. The mixture is worked, after the addition of water, into a stiff mass, which is used for the molds, the latter being made in a manner similar to sand molds, and dried slowly. When dry they are washed with a dilute solution of soluble glass and dried again, this operation being repeated three or four times. When perfectly dry, the mold is burned, to give it a glossy appearance.

IN HARDENING small steel tools, or any article of steel that is thin or light and heats quickly, it is advisable to remove, on a grindstone or emery wheel, the scale formed in forging before heating. The scale being of unequal density, if it is not removed it is generally impossible to heat evenly; besides, the degree of heat can be better observed if it is removed.

A GOOD READER.—A fair intellectual development, with good lungs and a good voice, will be a sufficient basis for one who desires to become skillful as a reader. Careful practice, daily, should be the rule, in accordance with the requirements of a teacher or a text-book.

GERALD PEMBERTON, who shipped as a hoy on the steam whaler *Bowhead*, on his arrival here this week from the Arctic, found that during his absence a fortune of £10,000 had been left him. On getting ashore he immediately asked for a discharge.

MINING districts in the western portion of Utah, long since abandoned, are being prospected successfully by miners.

ONE of the small mines of Tintic, Utah, has taken out $100,000 worth of high grade ore this season.

Mining Share Market.

The inactivity in the stock market continues. There is very little of interest to record, transactions being comparatively few and fluctuations small. Up on the Comstock they are still sinking away, but nothing startling has occurred there for some time. At the Ophir a considerable amount of ore in the shape of filling is being extracted from the 150 level. It is evident, from the explorations that have already been made, that not much new ore need be expected at this point. The ground has been pretty thoroughly worked over, and they must look deeper. At the Hale and Norcross they are still doing some prospecting, but the strong indications of water in various directions greatly circumscribes the operations. They will not be able to strike out squarely across the vein until the new hydraulic pump is in operation at the Chollar-Norcross-Savage shaft. Then they need have no fear of water drowning them out, and may go in whatever direction promises best. Then they may also fearlessly crosscut in the Chollar, the Savage and the Potosi. At Gold Hill the amount of ore extracted at the several mines—Crown Point, Belcher and Yellow Jacket—is being steadily increased. At the latter they are now daily extracting about 100 tons of ore, and have a large amount in sight, into which they have opened out on the Sagebrush level.

Bullion Shipments.

Ontario, November 6, $10,611; Horn Silver, 6th, $12,000; Hanauer, 6th, $2,560; Crescent, 7th, $2,490; Stormont, 6th, $2,490; Vienna, 7th, $1,827; Horn Silver, 7th, $15,000; Alice, (for Oct.) $105,836; Vienna, 8th, $3,372; Ontario, 3d, $9,775; Bullionville, 8th, $6,934; Horn Silver, 8th, $6,000; Hanauer, 9th, $7,200; Alice, 9th, $11,362; Vienna, 9th, $3,442; Ontario, 9th, $4,664; Horn Silver, 9th, $12,000; Alice, 10th, $14,809: Horn Silver, 11th, $9,000; Ontario, 11th, $4,592. Bullion and ore receipts in Salt Lake City for the week ending November 7th, inclusive, $176,468.69, of which $171,958.69 was bullion, and $4,510 ore.

News in Brief.

SEVERAL of the carriages which recently took the guests to the Guildhall banquet carried electric lights in place of the ordinary lamps.

A SEVERE gale swept over the lake region, New York and New Englaud, on Sunday, causing the loss of several lives and much property.

SEVERAL of the London newspapers recently published articles suggesting the establishment at New York of homes for the reception of English girls who emigrate with the intention of becoming domestic servants.

ONE Neehle having made a splendid pedestrian record without stimulants, a New York admirer offers to hack him against any other pedestrian in the world on an attempt to walk 250 miles in 100 hours, and to make two and one-quarter miles in each and every hour.

AH YOU, a Chinaman twenty five years old, applied to a United States Commissioner in New York, on Saturday, for first papers as a citizen of this country. The United States District Attorney decided that under the act of Congress he could not become a naturalized citizen of this country.

THE Mexican government definitely refuses the demands of the English hondholders to issue $20,000,000 three per cent honds in addition to the recognized debt, $80,000,000. The decision ends the negotiations, and the Mexican representative in London has been recalled. The Mexicau government desires a settlement, but considers the bondholders' demands excessive.

STRENGTH and health go together. Obtain this happy physical state by using a bottle of Brown's Iron Bitters.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. *Ledger*, Nov. 10: The Amador mill is running 20 stamps steadily. The company have got in heavy supplies of wood and timbers, which looks like business through the winter. It is expected that even if the rock now being crushed should be of low-grade it will improve as the tunnel advances towards the old works.

DOYLE.—W. Doyle, on Saturday, sold his quartz claim in Hunt's Gulch, to Daniel H. Sawyer, for $15,000. Recent developments on this claim are of a very encouraging character. A large body of ore, apparently of good quality, has been met with in the tunnel. It is plentifully charged with sulphurets, and prospects well in free gold.

NOTES.—In the Wabash claim, where a streak of rich ore was struck, the ledge has increased from 20 inches to 4 ft in width. The work now in hand is sinking a shaft from the tunnel. A. Hayward has secured a controlling interest in the Seaton mine. Humphrey Rees is superintendent. Ten or twelve men are employed about the mine. At present drifting for the ledge is the work in hand.

Calaveras.

NOT YET PLAYED OUT.—*Chronicle*, Nov. 10: Notwithstanding the placer diggings are considered "played out," a clean sweep has not yet been made. J. Hines & Co. recently struck a pretty fair little bonanza in Alabama Gulch where it debouches in the Calaveras River, below Rich Gulch. They have been at work for sometime opening the claim. The other day they succeeded in extending their work into the diggings, and, scraping the bedrock and panning the dirt, in about an hour's time they had gathered nuggets to the value of $120; the largest, which was shown us, being about the size and shape of an almond nut.

El Dorado.

GREENWOOD.—Cor. Placerville *Democrat*, Nov. 10: E. W. Hulford is at work on the Cederberg, Dr. Martin has resumed operations on the New El Dorado, the tunnel on the Morrell Con. is being quietly pushed along, and the Smith Bros. are having some work done on their American Canyon claim. At Zentgraf's, (near Wildgoose Flat) all is activity. Mr. Zentgraf has run a tunnel from the mill 309 ft along the ledge, giving him an ample supply of ore for milling during the winter, and at the mine he has built a water-power wheel to drive a 6-inch pump. The ore from this mine is of superior grade, and Mr. Zentgraf has every prospect of a profitable winter's work on his 2 mines.

NEW EL DORADO GOLD M. CO.—Georgetown *Gazette*, Nov. 9: This week Mr. A. W. Martin favored us with a prospectus of the new company. Mr. Martin has just returned from San Francisco, and will begin the work of development right away with a good force. On the south is the famous old Cederberg which has yielded close on half a million of dollars, which after a long period of idleness is now being opened up by Mr. Ed. Hulford. On the north is the Morrell Con. mine. This company is now driving a tunnel to cut the rich shoot seam 60 ft below the present level. It is well known that handsome specimens of quartz more than half gold and weighing from a few ounces to many pounds have been found from time to time on the hillside of this claim. Few mining enterprises have so good a promise for a rich reward as the New El Dorado. A new life is growing up all along the line of the great Greenwood seam belt. We feel confident of grand results flowing from the enterprises inaugurated there this winter. A shaft has been sunk in the ledge to a depth of 40 ft, from which $15,000 or $20,000 worth of rich ore was taken. One piece of quartz, some 18 inches square, taken from this shaft, sold for $6,400. A portion of this specimen is now on exhibition in the Academy of Sciences in Paris, France.

Fresno.

GERTRUDE ITEMS.—*Republican*, Nov. 10: The Enterprise mill is running again, and will doubtless make a very successful run, as there is a large quantity of ore on the dump and plenty of water. The Hamilton mine has been sold and the new proprietors are erecting a mill, and making extensive preparations to run the mine on a large scale in the future. A hundred tons of ore from this mine are being crushed at the McDonald mill. A car-load of ore is being "packed" down from Mount Raymond to Fish Camp for shipment.

Inyo.

BROWN MONSTER.—*Independent*, Nov. 3: Car-loads of ore are being shipped, and with returns that indicate the ores to be of high grade. The last car-load of 10 tons shipped to Oakland sold for $95 per ton. There is at the railroad another load of equally valuable ore ready for shipment or reduction. The adjoining mine, the Hirsch, is also being worked, and high-grade copper and galena extracted.

AT ELNA.—From advices we learn that the furnace is done, and that as soon as W. P. Miller arrives, who is expected every day, arrangements will be made for commencing operations and firing up for steady work. The new tunnel on the Montezuma is progressing rapidly, and is being driven in ground that shows a good quantity of carbonate ore of fine grade.

Kern.

PIRU MINING DISTRICT.—Cor. of Bakersfield *Californian*, Nov. 10: We have just struck the ledge we were running for. It shows quite a large body of first-class gold and silver bearing ore. We are down 70 ft. This is only one of the mines which comprise the new Comstock lode. There are ten claims in all, aggregating 15,000 linear feet. It would be a fine property for some strong company, as all these claims show ore on the surface, worth, under a working test, from $29 to $35 per ton in gold and silver. There is plenty of water and timber in the vicinity. The Frazier mine has a few men employed. It is understood that the owner is now in England negotiating the sale of the property. Rich ore has been found in every part of the district during the recent prospecting season. Quite a boom here is inevitable next year. We have ores precisely the same character as those of the celebrated Calico district. We are but 100 miles distant from it, and in the same mountain system.

Mariposa.

BUENA VISTA MINE.—*Herald*, Nov. 9: The O'Gorman brothers have made all arrangements for the erection of a ten-stamp mill on the Buena Vista, and the work will be commenced at once. Teams have been engaged to haul the machinery from Bear Valley. James O'Gorman thinks the mill will be ready for work within a month. Only 5 stamps will be placed in position for a short time.

Mono.

STANDARD-BULWER MILL.—Bodie *Free Press*, Nov. 7: The Standard-Bulwer mill, under the management of Sam McCurdy, is considered by millmen to be the very best on the Coast. The 30 stamps crush daily from 145 to 155 tons of Standard ore, which is handled so systematically that the visitor wonders how it can be done. From one floor to another material is conveyed by various appliances, most of which originated in the brain of Mr. McCurdy. An hour or two may be profitably spent in examining this model quartz-mill. It is safe to say that no other mining camp can boast of one like it.

NUMBER 78.—The Standard Con. Mining Co. has declared its 78th consecutive monthly dividend of 25 cents per share, or $25,000, payable in San Francisco and New York on Monday, the 12th inst. This makes the aggregate of dividends paid by the Standard Company $4,300,000.

MAY LUNDY.—Homer *Index*, Nov. 10: The south drift from No. 1 winze, 130 level below the lower tunnel, was advanced 10 ft during the week, and shows improvement in size of vein and quality of ore. All the stopes are looking well, and while the mill is crushing 30 tons per day, the teams are rapidly filling up the large ore yard. Seventy-five men are to be employed underground in the May Lundy alone during the winter, opening up new levels and running out ore, and a 40-stamp mill is to be erected at or near the foot of the tramway as early next spring as practicable

Nevada.

MERRIFIELD.—*Transcript*, Nov. 8: The Merrifield mine, which has been idle for 10 weeks past, has been purchased by a New York incorporation known as the "Merrifield M. Co. of New York," the transfer having been accomplished through the agency of D. T. Hughes. Mr. Hughes takes charge of the Merrifield, and will to-day start steam. He will begin with a moderate force of men, increasing the number as circumstances will admit. All the floating indebtedness will be paid in full on Saturday next.

IDAHO.—Grass Valley *Union*, Nov. 6: The Idaho M. Co. yesterday declared a monthly dividend of $2 per share, amounting to $6,200. The payment of a $2 monthly dividend is an increase of $1 per share over the dividends that have been paid for several months past. The company has been under extraordinary expenses the present season, but the prospects for regular dividends seems now assured. The mine is looking well on the 12th, 13th and 14th levels, and a strong ledge is in the shaft.

Placer.

DAMASCUS.—The Placerville *Democrat*, of Nov. 10, says: Messrs. E. Mortensen and Frederick Shermier, who are mentioned in the Placer *Herald* as having just made a remarkable strike in gravel at their claim above Damascus, in Placer County, own 640 acres, and have been working the claim for 7 years. When there last week they found that gravel had been cut into for 30 ft in width, and in prospecting no pan of dirt was washed containing less than 25 cents, and many went as high as $5 and $6. The indications are that they have several hundred ft of gravel.

Plumas.

RIVERDALE.—Quincy *National*, Nov. 10: The shaft is going down slowly, 1 side being in bedrock, which is pitching to the west, indicating that they are on the east rim of the channel. They will have to sink some feet further to bottom it. There is now no question but that the Riverdale ground is rich. It is also highly probable that the famous lead runs through the O'Neill ranch.

RICH PAY.—Loring & Leavitt have made another lucky strike in Elizabethtown, and the indications are that they have several hundred feet of the channel which have never been worked. We have no figures, but are told they are making big pay.

MILLS SHAFT.—The big tube is going slowly down into the bedrock at the bottom of the valley, being now nearing 230 ft deep. The rock is soft and the drills cut it easily. Some more tubing is on the road, which would indicate that it is to be pushed down some 20 ft into the bedrock before drifting will commence.

SOUTHERN EUREKA.—Greenville *Bulletin*, Nov. 7: The tunnel reached the ledge a week or two ago, and since then a drift has been pushed into the chimney about 40 ft, and at a depth of about 168 ft below where Taylor took out the last rock. The ore found in this drift is better than the best worked by Taylor. This is in accordance with what was seen in the upper workings, that the ore is richer the deeper it goes. The mill will be put in order and started up again without delay.

San Bernardino.

DAGGETT.—*Semi-Tropic*, Nov. 10: Jack Cockrane last week struck a splendid body of ore in his mine. One shot knocked loose 2 tons of ore which would assay fully $500 per ton. The King is doing splendidly; 16 and 18 mule teams are constantly on the road from Calico to Daggett, hauling ore. Calico mines generally are full of promise. Mr. Bateman, at the Lava Beds, recently made an immensely rich strike, the ore from which assays up in the thousands. The Lava-Bed mines are looking excellently.

Sierra.

RAINBOW.—Downieville *Messenger*, Nov. 10: The Rainbow M. Co., at Chips' Flat, is still employing Chinese in running their bedrock tunnel. It is reported that the celestials have been armed with rifles, with the expectation that the white men of Alleghany would attempt to drive them off. We have not heard that any resort to force was contemplated. Should, however, the Miners' Union at Forest City and Alleghany decide to remove the obnoxious workmen, a few rifles in the hands of the Chinese would not prevent their accomplishing that object.

GRIZZLY.—*Tribune*, Nov. 8: The old Grizzly ledge, which is located near the noted Alaska mine at Pike

City, is being reopened by direction of the present owner, formerly a resident of this county. The gentleman discovered the rich central pay shoot in the Alaska, which yielded such handsome dividends to the owners a number of years ago. The Grizzly was located in 1854 by some miners, who found rich gold quartz in the croppings, from which several thousand dollars were crushed out in a hand mortar in a few hours. At times since the ledge has yielded rich specimen quartz, but the bulk of the vein is a milling ore of excellent grade, carrying fine free gold and sulphurets rich in metal. Astonishing "pan-prospects" can be obtained anywhere along the walls in the upper tunnel, where some 500 tons of ore are already uncovered, awaiting extraction.

RENEWING AN OLD PROSPECT.—L. D. Davis was up at Lady's Canyon last week, surveying a quartz claim that he and George Davis are interested in. The claim lies north of the Columbo location. The ledge is of more than average width, prospects well in the croppings, and bears every indication of proving a true fissure vein.

BONANZA.—Mr. Sunderland, superintendent of the Bonanza mine, at Howland Flat, was in town last week. A small force of men are engaged in carrying on developments in that claim. It is believed that the company will succeed in uncovering a rich channel in their ground.

BALD MOUNTAIN.—From 300 car-loads of gravel taken out of the South Fork ground the Bald Mountain Extention Co. cleaned up 47 ounces of gold Sunday.

Trinity.

MINING NOTES.—*Journal*, Nov. 10: Supt. Loveridge is getting the Oregon Gulch mine in splendid shape for work the coming winter, and calculates upon taking out a large quantity of "the precious," if the water supply shall be good. John W. Shuford has our thanks for a number of specimens from the Little Donkey mine, in Trinity Center district. While free gold is visible in some of the pieces, all prospect well.

Tuolumne.

LAMPHIER.—Sonora *Democrat*, Nov. 10: Sinking in the shaft at the Lamphier mine has been recommenced. The shaft has been enlarged, and 3 shifts, of 4 men each, are putting it down with all dispatch. The ledge in the bottom is very large, and the quartz is very rich. The work of extracting rock has been stopped until the mill is ready to start. Five more stamps have been ordered, which brings the number up to nine. Four Frue concentrators are being put up.

RISING SUN.—Matters are progressing satisfactorily at the Rising Sun. The mine is developing beyond the most sanguine expectations. The mill is rapidly nearing completion. A ditch 4 miles long is being dug to bring water.

PATTERSON.—Developments in the lower levels of the Patterson mine continue to be of the most encouraging character. The quality of the ore has improved in a marked degree, and some of it fairly bristles with free gold.

GARIBALDI.—The Garibaldi mill is about completed. The machinery is being put in place and will be ready to start up in a few days. This is an experimental mill Huntington's centrifugal. The present condition of the weather and a scarcity of water makes it favorable for "dry washing."

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Nov. 10: Some ore of good quality was found in the east cross-cut from the main north drift on the 2700 level, and in the east cross-cut from the south drift the indications are favorable for finding the same streak. At some points it was found necessary to discontinue work until the new hydraulic pump at the Chollar-Norcross-Savage shaft goes into operation, as there were strong indications of water.

ALTA.—Are now engaged in placing a partition in the shaft for the purpose of creating a circulation of air that will cool and ventilate the 2150 level.

UNION CON.—On the 3000 level work has been resumed in the west cross-cut, which is being advanced in a soft and promising vein material. On the 3100 level a station is being cut out joint with the Sierra Nevada.

SIERRA NEVADA.—The upraise from the main north drift on the 2900 level is being advanced at the rate of 15 ft per week. It will be pushed up to the 2700 level as rapidly as possible.

MEXICAN.—Good progress is being made in the main north drift on the 3100 level, which is now nearing the south line of the Union Con. The ground continues dry and favorable to progress.

YELLOW JACKET.—About 100 tons of ore per day is now being extracted, and the amount is gradually increased.

CROWN POINT.—The amount of ore extracted is gradually being increased. The mills on the river will soon be running to their full capacity.

COMBINATION SHAFT.—The station for the new hydraulic pump is completed and the foundation finished, ready for the reception of the machinery, which will soon arrive from San Francisco.

CALIFORNIA.—On the 2700 level the joint Con. Virginia winze is being sunk and timbered at the rate of 10 to 12 ft per week, in ground of a favorable character.

BELCHER.—Some ore is being extracted, and the amount will be gradually increased as additional stamps are put in operation in the mills on the Carson river.

CON. VIRGINIA.—The joint California winze on the 2700 level is being sunk and timbered at the rate of 10 ft per week.

UTAH.—On the 1350 level east cross-cut No. 2 is being pushed ahead at the rate of about 30 ft per week.

BEST AND BELCHER.—Very good progress is making in the joint Gould and Curry winze on the 2500 level. Thus far the ground is dry and favorable.

GOULD AND CURRY.—Work in the joint Best and Belcher winze, on the 2500 level, is progressing favorably. It will be sunk to the 2700 level.

ANDES.—Considerable ore is being extracted and sent to the mills, and the drifts are still finding ore that will pay for working.

OPHIR.—A considerable amount of ore in the shape of old fillings-in have been extracted from the 150 level.

OVERMAN.—Some low-grade ore is still being extracted from the old upper levels.

IMPERIAL.—Rapid progress is being made in the west drift from the 600 station.

UNION SHAFT.—Are still cutting out behind and easing timbers at the 2300 station.

Bernice District.

WILD GOOSE.—*Silver State*, Nov. 8: The Austin *Reveille* learns from a gentleman just in from Bernice, that the Wild Goose mine has just had 13 tons of ore crushed at Rothwell's mill. The first grade went over $200 a ton, the second $107, and the third $80. The Wild Goose has a tunnel in 200 ft, and have opened out breasts 65 feet wide, in ore all the way. They have now six men at work.

Candelaria District.

COLUMBUS CON.—*True Fissure*, Nov. 3: The drift from cross-cut No. 1 was advanced 10 ft during the week, and is in favorable looking ground. The face is showing streaks of good ore. The raise to connect the 150 level with the lower level of the old workings will be completed some time during the coming week.

MOUNT DIABLO.—The stopes below the tifird level are turning out the usual amount of ore. The stope above the west drift drift on the third level is yielding some ore of a good grade and the ledge shows improvement. A bullion shipment of $11,371.48 was made last Monday.

Esmeralda District

MT. CORY.—*Herald*, Nov. 10: There is no particular change to note at the Mt. Cory mine or reduction works. All things run smoothly at both localities, and are being pushed by all the power of skill and money. Car-loads of huge iron tanks and hoppers are coming in and are fowarded to the mill.

Ploche District.

BULLIONVILLE.—*Record*, Nov. 3: The toot of the B. S. Co.'s whistle, that for the past 3 years has called to work some 50 emyloyees, will be heard for the last time some morning of the coming week, as every thing that can be profitably concentrated is cleaned up around the old tailing pits.

CLOVER VALLEY.—There is quite a little excitement at Clover valley over the discovery of a rich prospect in the Bull valley country by old man Crow. The ledge is 6 ft in width, with rich ore running through it, from the thickness of a knife blade to an inch. We were shown one of those pieces that assayed $5,500 per ton.

MENDHA.—At the Mendha mine the damage caused the shaft by the late fire has all been repaired. A whim has been placed on the shaft and the hoisting of debris commenced. In a couple of days every thing will be in readiness for hoisting ore.

Ward District.

MONITOR MINE.—Reno *Gazette*, Nov. 9: The Ward *Reflex* of last Monday says: From William Baker, who came over from Taylor yesterday, we learn that the Monitor mine is opening out big in the south end. The ore body is 12 ft wide, pitches into the mountain in a southeasterly direction, at an angle of 45 degrees, and assays from $80 to $5,000. It is chloride, black metal and horn-silver. He says he would give $1,000 an hour for the privilege of working the mine, as it looks, with four men, and would then make more money than the owners of the mine.

White Pine District.

GRANITE GOLD MINES.—*News*, Nov. 3: Fred. Gotchett and George Judson shipped 36 ounces of fine gold last Monday, the product of 10 days' run from their little 2-stamp mill in Telegraph Canyon. These men have some very promising gold prospects in their mines in Granite district, some 20 miles south of Cherry Creek, in the Egan range. We have been shown some specimens from these ledges that were speckled all over with native gold. There is more ore in sight in 2 of these mines than the price asked for the property.

TOANO.—Parties in from the railroad inform us that quite a mining excitement is stirred up in Toano by the discovery of what seems be rich silver mines near that place. Many claims have been located, some of which show splendid prospects.

ARIZONA.

SILVER MOUNTAIN DISTRICT.—Prescott *Courier*, Nov. 6: The once immense Agua Fria district is now divided into 5 or 6 districts, embracing Tiger, Pine Grove, Silver Mountain, Lane, Humbug, Castle Creek, and some others. Silver Mountain district takes in a large spur of the Bradshaw Mountain range. Its ledges are very large. One of them, the Mammoth, is the largest in Arizona. It is bigger than the Vulture, but is not very rich in gold. For this reason, it was sneered at by ancient prospectors. It is a great many years since we first camped on it. At that time we would not have given 6 bits for it. To-day we have not sufficient money and property to purchase 50 ft of it.

NOTES.—Prescott *Courier*, Nov. 3: Curtis & Co. are drifting and sinking in the rich Lynx Creek gold mine. T. J. Eaman, Supt. of the Black Warrior mill and mine, is in the city. He brought in some bars of silver, which are now on the road for New York. Jolly Ben Robinson has been examining mines of Black Hills district. Thirty-six thousand pounds of bullion were shipped to Chicago yesterday, from the Howell reduction works. This makes the shipments for the last month 200,000 pounds.

RICH.—Wash Hanna and Jas. Elmore relocated the Crook mine. One ton and a half taken from the bottom of the 75 ft shaft yielded, by arastra process, the sum of $175. They have a bushel or more of specimens worth hundreds of dollars. The boys have "struck it," sure pop.

COLORADO.

SNOWDRIFT.—*Miner*, Nov. 3: Last Saturday 79 sacks of ore from the Thompson level of the Snowdrift were at the Pelican mill. The weight was 3 tons. The ore ran 308 ounces silver per ton, netting over $1,000. It was taken out by 2 men in 10 days, making the product from 1 stope alone over $100 per day. Wilson & Sheets are the lessees. This week they have been taking out more ore than ever, which they estimate will run from 400 to 500 ounces.

BISMARCK.—From the stope on level No. 3 in the Bismarck, 2 men working 4 weeks took out 53¼ tons of ore, that ran, first-class 414 ounces, second-class 150 ounces silver per ton. The men received nearly $800. In level No. 2, Henry C. Bates is sinking on a 12-inch streak of ore that runs 283 ounces.

LITTLE MATTIE.—*Gazette*, Nov. 3: The shipments from the mine for the month of October amounted to about 95 tons. The returns from 84½, up to Oct. 31st, reached $5,000. Fifty-eight men are employed on the property.

RED ELEPHANT.—*Courier*, Nov. 1: A new and promising prospect has lately been made on Red Elephant Mountain. It is called the Bedford lode, and is located about 175 ft above the Young America. Out of a 10-ft hole the ore run from 220 to 325 ounces silver per ton. Syster & Co. are the lucky ones.

VULCAN.—Sam. Worthington & Co., who are leasing on the tunnel level of the Vulcan, 600 ft from the mouth, are in big pay. They have struck from 2 to 3 inches of high-grade "stuff," the first-class of which mills 500 ounces, and the second-class 200 ounces silver per ton.

DIAMOND TUNNEL.—This gigantic tunnel is now 2,188 ft in length. Much interest is taken in the developments lately made on the first intersection of the Corty City veins which this tunnel cuts at 2,100 ft from its mouth. Thus far 4 distinct and well defined veins have been encountered within a distance of 50 feet of crosscutting. The production up to the present time of the lodes cut by this tunnel is as follows: No. 5 and E. K. Baxter lode, $350,000; D. T. No. 6, $160,000; Pelican and Dives, over $2,000,000, besides considerable production from smaller veins.

IDAHO.

ELKHORN.—Wood River *Times*, Oct. 31: The Elkhorn mine has paid the owners a net profit of $25,000 per month. I. I. Lewis, the superintendent, states that new developments have placed in sight large bodies of high-grade galena. The average net receipts for every ton of first-class ore shipped to the Philadelphia smelters is $165 after the deduction of transportation and reduction. Besides a regular daily shipment of 12 tons of ore, much is being done to give the mine complete drainage, by a tunnel which will tap the vein at a depth of 500 ft. It is expected that it will be finished by the first of next month.

BULLION.—The camp of Bullion is yielding the usual 50 to 60 tons of ore per day, which are brought to Hailey and shipped by rail to Salt Lake, Omaha, Kansas City. This production, which is apparently quite large, is not half as large as it could be if a local market were provided for our ores.

ALLEN GROUP.—The Allen group of mines, on Warm Spring creek, has again changed hands. But this time the purchasers are a Michigan syndicate of mining men who have had experience in the copper mines of Lake Superior. The consideration stated is $50,000. The sale was negotiated by James McGregor and Sam. D. Conner, who bought the Allen group last June, and who have since had a force of men at work opening up the property.

MONTANA.

SUMMIT VALLEY DISTRICT.—Butte *Miner*, Oct. 31: In the Magna Charta, the drift from the 200 level shows a good body of ore assaying about 42 ounces. On the 100 level the ore body lately struck still improves in quality and size as the drift to the east is extended. About 100 tons per day are being crushed.

POLLACK.—A 100 ton lot of ore now being worked is running at an average of 80 ounces.

CLARKE'S COLUSA.—In the drift from the old discovery shaft 150 tons of 30 per cent copper ore have been taken out, and while doing this there has been taken out 2 car loads of copper-glance assaying 70 per cent copper.

WASHOE.—*Inter-Mountain*, Oct. 30: What promises to develop into a very important strike was made on Saturday in the Washoe mine, at a depth of 212 ft. Mr. Leggat states that a fair sample taken yesterday assayed $46 in silver and 12 per cent copper, and he therefore knows that he has at least 9 ft of good pay ore. There is no reason why the ledge should not be as wide at the depth of 212 ft as when penetrated by the shaft near the surface. The Washoe is beyond doubt on the same great copper-silver belt as the Gagnon, Original and Parrot.

MOULTON.—On the 400 level on the south vein, which has lately been connected with the level above by a winze, some very productive stopes are being opened about 750 ft from the east end line. The ore shoot is wide and continuous and of excellent grade.

ALICE.—Yesterday Supt. Hall let a contract for the extension of a drift from the bottom of the 800 ft winze for a distance of 100 ft. In all the upper levels good ore has been struck east of the shaft, and there is no reason why the experience on the 800 level should be different. Drifting on the west 800 level on the north or hanging-wall side of the vein progresses on about 3 ft of 40 or 45 ounce ore.

ANACONDA.—At the great smelter, now being erected by the Anaconda Co. on the north side of the creek, every thing is being rushed ahead as fast as possible. The calcining furnace room alone is 469 ft long. The concentrator building has a frontage of 340 ft. In fact the size of the plant fills one with surprise, and it will be a matter of regret should the failure to get material cause a temporary stoppage of part of the work until the spring, which is likely to be the case.

NEW MEXICO.

DUG-OUT CAMP.—Silver City *Enterprise*, Nov. 2: There was an old adobe smelter lying idle in camp that was formerly used by parties in the business of counterfeiting Mexican dollars. A few weeks ago it occurred to Marsh, Smith, Burnett and Divine that the old concern might be utilized to advantage in reducing ores. It was patched up, a torn and leaky 28-inch bellows was pressed into service to furnish blast, and a trial run was made. The outcome was satisfactory. The bullion flowed freely, and after a seven hours' run the delighted owners found themselves in possession of 500 pounds of base bullion, carrying silver to the amount of $400 per ton. When the repairs now in progress at the adobe are completed, it will be capable of treating about 4 tons of ore during 24 hours.

FLEMING.—The Carrollton mill, under J. W. Fleming, is working to perfection. The 15 stamps are run day and night on Old Man ore of low grade. The high grade will be treated as soon as the supply of low grade is exhausted. Twenty tons daily are being worked, and 82 per cent of the assay value is being saved, the balance running into the tailings, which will be concentrated. All the available teams are hauling ore from the mine to the mill. High grade ore to the amount of $40,000 has been sold.

ARTHUR LEE.—On the Arthur Lee claim, in Cow Springs district, adjoining the property purchased by J. W. Fleming in Givens' Camp, Ben Laswell uncovered 12 ft of a 40-foot ledge, that from an average assay goes $55 silver and a high per cent in lead. The claim is owned by Col. Bennett, Martin Maher and Ben Laswell, who commenced work upon it but a few days ago. The ledge is a monster. Sample assays that run fabulously high have been made.

SIERRA GRANDE.—Deming *Tribune*, Oct. 31: Dr. Endlich in two months has uncovered low-grade ore enough to keep the mill in operation for two years at least; he has got the mill in perfect working order; he has received and put in operation the diamond drill; he has shipped over 1,200 tons of high-grade ore—725 tons during October; he has a completely organized working force of nearly 300 men; he has straightened out the muddled accounts, and has put the mines in condition for regular and satisfactory production. This has all been done without any flourish of trumpets.

OREGON.

MINERAL CITY.—Cor. of Bedrock *Democrat*, Oct. 31: They have struck it rich in the Black Maria mine. Assays from the bottom of the incline went $600 per ton. The Boone is looking fine, and assays $500 per ton. The shaft is down 40 ft, and shows well. The Muldoon is looking well. The owners are running a tunnel that will develop the ledge in good shape. The Egan and Nevada mines, lying side by side, look well; the owner is running a tunnel on the Nevada, and the ledge shows a large body of high-grade ore. The miners are in high spirits over the prospects. There has been a new discovery made in the last few days that bids fair to rival any thing in the camp. C. B. Gunn is the lucky boy this time.

NOTES.—Jacksonville *Times*, Nov. 2: The Sailor Gulch diggings near Waldo are being fitted up for an extensive run. Joe Epperson & Co., of Steamboat are putting their hydraulic pipe on some diggings on Applegate. Jack Layton is piping away at Farris Gulch. Hays & Magruder, who have good hydraulic mines on Rogue River, are making extensive preparations for winter. Saltmarsh Bros. inform us that miners of Sterling are ready to take advantage of the winter season. Curtis Bros. are working over the old tailings and ground on Jackson Creek. G. B. Caldwell was making some arrangements Monday for hydraulic pipe for the placer mines on Steamboat.

UTAH.

HORN SILVER.—Southern Utah *Times*, Nov. 3: The average weekly shipment of the Horn Silver Co. is 22 cars, valued at $66,000. Shipments since the first of January last to Oct. 19, $2,662,000; present total for the Horn Silver $2,728,000; and yet the stock keeps on declining in the face of the undoubted fact that the mine is better now than ever before.

The Salt Lake *Tribune* of the 6th says: A few days ago Major Goodspeed visited the Horn Silver mine, the first time since he experted the property 4 year ago. At his recent visit he made some very interesting measurements. By actual measurement he found the average width of the ore body between the fourth and sixth levels to be 70 ft, and the average length 150 ft, by 200 ft in depth, containing 2,100,000 cubic ft of ore. The dividends paid by the company up to date show that this $60 orc has yielded $20 per ton net profit. Therefore, between the fourth and sixth levels of the mine, in the 147,000 tons of ore there is contained $2,940,000 in dividends for the stockholders. At $60 per ton, the gross value of the ore now exposed between the sixth and seventh levels is $8,064,000; or, at $20 per ton, the net value of Horn Silver ore, $2,688,000, to be paid in dividends to stockholders. Up to the present time the Horn Silver has put out 150,000 tons of ore, and has paid $2,700,000 in dividends, besides buying into the Utah Southern railroad, putting up the smelter, and now having en route to New York several hundred thousand dollars' worth of bullion. According to Major Goodspeed's figures, there is ore in sight between the fourth and seventh levels to the gross value of over $17,000,000, and net profits of $5,628,000. He was asked to explain why the Horn Silver stock, in the light of these figures, has, within the past month, declined to $5.75 per share, and his answer was that there is a stock panic in the East. People, he says, have been so badly left on Little Pittsburgh, Chrysolite, Con. Virginia, and other high-priced mining stocks, that they will have no more mining investments at any figure.

PARK CITY.—*Record*, Nov. 3: At Daly's group, the new hoisting-works building is under cover and will soon be ready for the machinery. Work is to be commenced on the Barry Con. Mining Co.'s property next week, and sinking will probably be kept up all winter. The Uintah Mining Co. are making extensive preparations to work their property up Thayne's Canyon this winter. They are building a large tunnel house, and expect to run the tunnel 500 ft, to prospect the hill thoroughly.

WASHINGTON.

CŒUR D'ALENE.—*Inter-Mountain*, Nov. 3: The Cœur d'Alene excitement is still at fever heat in a good many places; yet, latest reports are to the effect that it is not only impossible to work the mines this winter, but extremely doubtful if the men now en route reach the mines or find accomodations when they are reached. The *New Northwest* publishes a correspondence from a man who attempted to reach the mines but failed. He talked with several who had been there, and nothing but encouraging reports were heard. Berry Davis' claim cleaned up ten ounces the last day's run, among which were two specimens weighing $10 and $14 respectively. But few claims were being worked with sluices, owing to the scarcity of lumber and lateness of the season. The most that was being done was locating claims and preparing for winter. Many of the claims were unprospected, and even their owners were not sure that they could "raise a color". Good judges estimate that at least ten out of every hundred that stay there this winter will die of pneumonia.

Poisonous and Troublesome Plants of California—No. 1.

Written for PRESS, by J. G. LEMMON.

Zygadenus Venenosus,

Poison lily, or so-called "Lobelia," or death camass.

"What ails my horses" is often heard in the agricultural valleys of the mountainous portions of California. The inquiry is always made by one not accustomed to the products of the country, and is answered by a citizen, "They have been eating lobelia; dose them at once with a handful each of salt."

The animals have suddenly become gaunt and colicky, weak, disinclined to travel, or to eat or drink. They groan, glare about them, dreul, and cough, perspire easily, breathe hard and frequently, with other signs of distress. Eventually they are affected with diarrhea, and often long sickness and emaciation follows, and not rarely death.

Usually salt, if administered at once, is a specific remedy, no other as yet being known.

The plant causing this distress, and often great loss, is often called by the farmers lobelia. It is, however, in no respect related to the lobelia family, but is a kind of melanthium, lately classed with the lilies. I suppose it was called "lobelia" because its effects are similar to that of the lobelia inflata of the East. Having once received the cognomen, it adheres, despite much effort on the part of the writer to correct the error and substitute "poison lily." Another popular name for the plant is "death camass," the name of camass being applied to the noted Indian food camassie esculenta, also a lily, often found in the same localities. The specific name of this species of Zygadenus being venenosus, is very appropriate, for it means poisonous. The plant grows sparsely in meadows, along with grass, sedges and other forage plants, maturing a little prior to them, but not too late to have its stalks with well loaded capsules of seed harvested along with the hay. The small, black seeds, in their leathery triple-pods, are supposed to contain the poisonous principle. This poison lily springs from a small deep-seated bulb, which is also possessed of a virulent poison. The Digger and Washoe Indians, who annually procure tons of roots from the same meadows where grows this bulb, are known to carefully reject the latter. However, in certain valleys it is said that hogs eat and thrive upon them, so they are called hog potatoes. This does not prove that the plant is not poison, for swine, it is well known, are unaffected by some kinds of most deadly poison, such as that of rattlesnakes, scorpions, etc. Farmers have been advised to dig up the bulbs and destroy them. The hog-rooting method is not to be recommended, for it destroys too much of the forage plants as well; and in certain very valuable meadows but little infested this could readily be done with a pick or a crowbar in early spring, when the lilies first appear.

Only horses are reported to be affected by this poison lily, though it is probable that other animals suffer from it, but naturally they are less in sight, and so escape notice.

Another lily similar to this, and perhaps as mischievous, is often mistaken for the one under discussion. This one is larger (two to three feet high), with yellowish-white flowers, and grows near meadows, on the dry, often stony, hard bluffs; never in the low, damp meadows, the natural habitat of the small white-flowered plant first described. The large one does not get into the hay, and so is not apt to be eaten in quantity.

Ranchmen whose hay contains poison habitually, suffer little or no trouble from it, either their stock rejecting the plant from their food instinctively, or by becoming proof against ill effects.

I am sorry to class this villainous plant with the generally beautiful order of lilies, but the great master, Dr. Gray, has declared it, and in it must go. The lily family is now a very large one, its characters having lately been carefully revised by the venerable Dr. Gray, and found to include four former orders now reduced to tribes; viz., smilaceæ, trilliaceæ, liliaceæ and melanthaceæ, comprising about 180 genera, with 1,900 species. Of these 50 genera and 235 species are found in the United States and British America.

The lilies are distributed well over the earth, principally in its temperate regions. In the tropics they become arborescent. The Dragon tree, dragœna draco, of the Canary Islands, being found 45 feet in circuit and 70 feet high. It yields the powerful astringent "dragon's blood." The properties of this great order are various, and range through every conceivable quality of usefulness or harmfulness.

The two first tribes, Smilaceæ and Trilliaceæ, contain but few species, all of which are innocuous but not edible.

The Liliaceæ or true lilies comprise four-fifths of the enlarged order, and include the most valued and splendid plants in cultivation. Their bulbs, however, usually abound in a bitter stimulant principle not to be trifled with. The magnificent "Crown Imperial" has a strong fœtid odor, and the bulbs are very acrid; and of the lovely tuberose, with its wonderfully abundant and sweet odor, it is wicked to have to say that when confined in a room it causes headache, and often death. However, among the lilies are some most edible bulbs, such as the onion, the "camass," or Indian potato of this Coast, and the asparagus.

The tribe Melanthaceæ are nearly all of them provided with drastic, narcotic, poisonous or medical properties, and to this tribe belongs our poison lily or Zygadenus. The tribe is principally distinguished from the other lilies by characters of the pericarp or seed vessel. It is produced in three erect tubular carpels, slightly adhering together at base and inclosing the seeds, as shown in adjoining cut. The other plants of this now great order have their three carpels united like valves, and forming a single three-celled seed vessel. All lilaceous or three-parted plants exhibiting the character of separated, distinct tubular carpels, may be regarded as suspicious. One of those claiming much attention on this Coast is the Veratrum Californicum, or California hellebore. This also grows in meadows, often in company with the Zygadenus described.

The plants often form dense thickets of large stout erect stalks, 2 to 5 feet high, clothed with large ribbed leaves like corn husks, the stalk upbearing a large open panicle of hundreds of greenish-white flowers. The green shoots in early spring are greedily eaten by all kinds of stock, and opinions are about equally divided concerning alleged effects. Perhaps the truth is the stock suffer from its use at first, then instinctively counteract ill effects by other plants which become an antidote. Instances are numerous where young cattle and sheep have suffered severe sickness and even death in large numbers, after they were known to have made a hearty meal from those sprouts.

The well known drug colchicum, growing in Western Europe, belongs to this tribe, and is a most powerful narcotic. Other plants are veratrum, poke-root, rattlesnake root, etc. rendering it quite proper to proscribe the whole tribe from careless experiments as food.

Seed Vessel—Natural Size.

ZYGADENUS VENENOSUS—POISON LILY.

JOHN W. MACKAY, the San Francisco millionaire, has gone into mining in Colorado, having bought the Hukill mines near Georgetown.—*N. Y. Graphic.*

TWELVE brigands have captured the Duke of Castellemore, at Tripoli. The brigands demand a high ransom for the body of the prisoner.

Mineral Statistics of Victoria.

The official statistics of the mineral productions of Victoria, which are presented year by year to both Houses of the Colonial Legislature, show that in 1882 the yield of gold maintained the improvement upon the production of the preceding year which that year showed upon 1880. The total quantity produced by Victoria last year, based upon the estimates made by the mining registrars, and on the amount of gold purchased by the Royal Mint and banks from private holders, was 894,486 ounces, being an increase of 35,636 ounces on the production of 1881. According to a memorandum prefixed to the returns by the Minister of Mines, the improvement is entirely due to the development of new alluvial mines in the colony, and he expresses belief that the further opening up of the basaltic areas in the localities where the improvement has occurred will for a long time continue to operate favorably upon the annual returns of gold. This prospect is satisfactory in view of the disappointment occasioned by the failure of gold fields in other parts of the world and the non-discovery of any fresh source of supply; but, although indirectly, no doubt, European countries must feel the benefit of any improvement in the production of the precious metal in Victoria, last year at least they would not appear to have received any direct benefit, for the quantity of gold exported was 54,460 ounces less than that shipped in the previous year. No explanation is given of the cause of this falling off, whether it was due to the colonial requirements prohibiting the export of a larger quantity of gold, or whether to some other cause; but there can be little doubt that, as the Australasian Colonies increase in wealth and population, more and more of their production of gold will be absorbed in internal uses.

The quantities of gold yielded by quartz mines and by alluvial mines, respectively, were 512,532 oz. and 352,078 oz., the former being a decrease of 7,018 oz. on the production of 1881, and the latter an increase of 38,250 oz. The sum of the two quantities we have named will be found not to agree exactly with the total yield mentioned previously, the difference representing the amount of gold purchased from private holders the source of which is not traced. Although the quantity of gold derived from quartz mines has decreased slightly, yet the average yield of the quartz obtained shows a small improvement. The parcels of which the mining registars received definite information last year produced an average of 9 dwts. .44 gr., as against an average yield of 8 dwts. 18.2 grs. in the preceding year. The richest district in point of yield of gold per ton of quartz continues to be Gippsland, which, however, only produces a small part of the total yield; its average last year was 1 oz. 4 dwts. 7 grs. per ton. The district of Sandhurst shows a marked advance both in its total production and in the average yield, and, taking both together, now ranks as the most important of the quartz-producing districts of the colony. Some interesting information is given as to the yield of quartz worked at considerable depths. The most noteworthy cases are the following: Quartz obtained at Stawell, from depths varying from 800 feet to 1,120 feet, yielded from 19 dwts. 14 grs. to 6 oz. 13 dwts. 19 grs. of gold per ton; while some stuff wrought in the Castlemaine district, at depths varying from 250 feet to 600 feet, yielded from 4 dwts. 3 grs. to 12 oz. 3 dwts. 1 gr. of gold. It is, unfortunately, not rendered plain whether the greater yield in either case was given by quartz procured at the greater depth, and it is worthy of remark that in other districts, where the quartz was brought from a distance from the surface much greater than in either of the cases just mentioned, the yield was by no means equal. The number of miners employed in the gold fields continues to diminish. The mean number at work during 1882 was 37,446, against 38,436 during 1881, or a decrease of 990, which is attributed to the gradual exhaustion of some of the old workings. The number of Chinese engaged in mining operations also continues to show a falling off, and on December 31st last there were 667 fewer employed than at the end of the year 1881.

So far as metals and minerals other than gold are concerned, it can not be said that Victoria has as yet been proved to be a rich country. The most important is tin. The quantity of the ores of this metal raised last year was 1,078 tons, which is a large increase upon the preceding year's production of 120 tons; and there are apparently prospects of a yet further development of this department of mining industry when the miners get settled down to steady work. It is, however, somewhat curious and instructive to read in the report from one district that certain revelations in connection with companies had had a most disastrous effect on the prospects of tin mining there, capitalists not caring to take the trouble to discriminate between the good and the worthless concerns, so that it was feared most of the tin-mining lease-blocks would be abandoned for want of the necessary funds to work them. As in 1881 so in 1882 no silver ore was raised in Victoria, but 20,343 ounces were extracted from gold at the Mint. The quantity exported amounted, however, to 71,446 ounces, while there would appear to have been only 18,350 ounces imported by the colony. The quantity of copper ore raised showed a small improvement on the previous year's production, but altogether it was only 692 tons. Attention would seem, however, to be directed more to the solution of the problem of extracting in an economic manner the gold contained in the copper than to the actual work of mining for copper. It is stated, that should some cheap means be discovered of separating the metals, the district where the copper ore was raised would prove to be one of the richest places in Victoria for mining. Of iron ore, 600 tons were raised against 1,092 tons in 1881. The remaining minerals worked in the colony do not call for particular notice from us, with the exception of coal. Since the possession of an abundant supply of fuel may almost be regarded as an essential to a country's prosperity, we are sorry to find that, so far as has yet been proved, Victoria is not rich in coal. Only ten tons were raised in 1882. Borings have been made at various points, but the results can scarcely be described as encouraging. It is not remarkable, therefore, that coal figures as the chief mineral imported. The trade of Victoria in metals and minerals other than gold is not large, the total imports last year having been valued at £564,824, and the exports at £53,155. The aggregate value of the mineral production of the colony since the first discovery of the gold fields to the end of 1882 amounted to £206,532,001, of which gold alone contributed £205,747,348. With mining operations carried on so extensively as they are in Victoria, it is natural that the question of explosives should receive considerable attention. From the report of the Inspector of Explosives we learn that dynamite and lithofracteur are the favorite explosives in most mines, and that few complaints are now heard of injuries or sickness being caused by their fumes. The principal part of the report is occupied with matters having a purely local interest, however, and of a character not likely to prove of concern to our readers.

THE Marysville levee system has been strengthened, and should be able to stand a flood several feet higher than the highest that has ever visited the city.

J. C. BANCROFT DAVIS has been appointed official reporter of the United States Supreme Court.

The Engineer.

Pullman Cars.

Through Pullman cars are now run between St. Louis and San Francisco, a distance of 2,440 miles. This is the longest continuous sleeping-car run in the world, with one exception. The Southern Pacific road, we believe, runs through-sleepers between San Francisco and New Orleans, a distance of 2,496 miles. A journey of 2,500 miles or so in the same car, on a continuous line, is something wonderful to contemplate, and yet is now an everyday affair.

A through fast line will soon be in operation between Paris and St. Petersburg. Arrangements have been made for running this train on the American plan, with Pullman sleepers, drawing and reading room and dining cars. The cars will be supplied with adjustable wheels, on account of the change of gauge at the Russian frontier, and the speed for the entire run is intended to be 56 miles per hour, not including stops—an extraordinary rate for so long a run. To those who have compared the miseries of a single day and night's ride in a compartment car with the ease and luxury of a journey of thousands of miles in a train on the American plan, it is only wonderful that the latter has not long ago been adopted on the great lines of Europe.

Probably the largest and most complete junction system in the world is that at Clapham, England, where the great railroad systems of London connect. The roads there lie together like the wires of a piano. Sixteen hundred trains a day run over them. But, unlike our own noisy stations and junctions, with our English cousins there is no shrieking of whistles, or clanging of bells. They keep their signals for their officials, and outsiders must expose themselves at their own risk. A tunnel-way for passengers connects the whole, so that no one is allowed to cross the rails except the employees, who grow foolhardy and now and then come to grief. On the average one man is killed every six weeks.

London *Truth*, in referring to the revolution now in progress in regard to railroad cars in England, says: "The French railroad carriages are the most uncomfortable in Europe. The seats are narrow, and the passengers are packed in them like herrings. In Germany and Switzerland, on the other hand, the carriages are roomy and comfortable; and unless the French find means to remedy this state of things they will infallibly lose the through traffic between England and Italy. If they want to hold their own they should have carriages somewhat after the model of the Pullman palace cars, running through from Calais to Genoa. Nothing but dire necessity ever leads a sane individual to pass a day and a night in the present French carriage."

Sources of Error in Spirit-Leveling.—Precise leveling in this country has been done by the United States Lake Survey, which has determined the elevation of all the great lakes, with a probable error of less than one foot; by the Coast and Geodetic Survey, which is carrying a line of levels across the continent from Chesapeake Bay to San Francisco; and by the Mississippi River Commission, which has a line from the Gulf as far north as Central Iowa, to be connected with Lake Michigan, and thence with the sea-level at New York. Mr. J. B. Johnson has been connected with some 900 miles of this work, and discusses the sources of error. He first classifies errors into compensating and cumulative. Then he treats them as, first, errors of observation, in the instrument or in the rod; second, errors from instrumental adjustment; third, errors from unstable supports; fourth, atmospheric errors, from wind, from tremulousness of the air caused by difference of temperature, and from variable refraction. He concludes that, with good instruments and proper care, thirty miles of line should be duplicated a month with one Y-level and a target-rod, and all discrepancies brought within five-hundredths of a foot into the square root of the distance in miles; or with the United States precise levels and speaking-rods, reading three horizontal wires, one instrument should bring the discrepancies within two-hundredths of a foot into the square root of the distance in miles.—*Jour. Ass. Engineers.*

More Railroads.—A project is on foot to build three more railroads in this state, the survey for one having already been commenced. This one will be an extension of the road at present running from Marysville to Oroville. It will be extended from the latter town to Big Meadows, Plumas County. The second road will extend from Rocklin, on the Central Pacific railroad, to what is known as The Bridge, thence to Cooperstown Ravine, then through Greenwood and Georgetown to Forneys, thus opening up a large fruit district. The third projected route will extend from Napa to Berryessa Valley, from which Lake County is easily reached. This road is to be constructed so as to connect Berryessa Valley with Napa, thus giving it an outlet to the bay.

Another Electric Railway.—The much talked of electric railway from Portrush to the Giant's Causeway, Ireland, a distance of about six miles, was opened on September 28th.

Useful Information.

The Properties of Oils.

M. Chevreul found metals to have, in certain cases, a remarkable influence on the oxidation of oils. Recently, the *Times* says, M. Livache has used, in this relation, finely divided metal—such as is got by precipitation—instead of metallic plates, and the effect is greatly increased. He thus tried lead, copper and tin, and found lead to have the strongest action. If precipitated lead moistened with oil be exposed in air an increase in weight is very soon observed, and this is greater the more siccative or drying the oil. With linseed oil, the increase of weight reaches a maximum in thirty-six hours, whereas, exposed alone to air the oil would take several months to reach the maximum. A solid and elastic product is obtained. With non-drying oils the increase of weight is much less, and takes much longer to be completed. The result in question, M. Livache points out, can not be attributed to a simple division of the matter, allowing more active circulation of air, for the same experiment made with various other substances in fine division does not result in any like increase of weight; the effect here is merely like that in the case of a thin layer of oil exposed to air. The change in the other case must be attributed to a direct action of the metal. He suggests what industry may derive certain advantages from the facts observed. Thus a rapid method is indicated of distinguishing drying from non-drying oils. Further, the heating of oils might be advantageously replaced by a circulation in contact with air, and in the cold state over iron or fine plates having precipitated metallic lead on their surface. The oils so obtained would be always less colored, and would retain great fluidity, while the objectionable odors and the danger of fire which attend the present mode of treatment would be avoided.

The Lead Pencil.—There is no lead pencil, and there has been none for fifty years. There was a time when a spiracle of lead cut from the bar or sheet sufficed to make marks on white paper or some rougher abrading material. The name of lead pencil came from the old notion that the products of the Cumberland mines, England, were lead, instead of being plumbago or graphite, a carbonate of iron capable of leaving a lead-colored mark. With the original lead pencil or slip, and with the earlier styles of the "lead" pencil made direct from the Cumberland mine, the wetting of the pencil was a preliminary of writing. But since it has become a manufacture, the lead pencil is adapted, by numbers or letters, to each particular design. There are grades of hardness, from the pencil that may be sharpened to a needle point to one that makes a broad mark. Between the two extremes there are a number of graduations that cover all the conveniences of the lead pencil. These graduations are made by taking the original carbonate, and grinding it and mixing it with a fine quality of clay in differing proportions, regard being had to the use of the pencil. The mixture is thorough, the mass is squeezed through dies to form and size it, is dried, and incased in its wood envelop.—*Scientific American.*

Improvement in Chimneys. — The best chimneys are made by inclosing hard baked glazed pipe in a thin wall of bricks. Such chimneys will not only draw better than those made in the usual way, but there will be less danger from "defective flues." A four-inch wall of bricks between us and destruction by fire is a frail barrier, especially if the work is carelessly done or the mortar has crumbled from the joints. To build the chimneys with double or eight-inch walls makes them very large, more expensive, and still not as good as when they contain the smooth, round flues. To leave an air chamber between them for ventilating is better than to open directly into the smoke flue, because it will not impair the draught for the fire, and there will be no danger of a sooty odor in the room when the circulation happens to be downward, as it will be occasionally. The outside chimney, if there is one, should have an extra air chamber between the very outer wall and the back of the fireplace, to save heat, a precaution that removes to a great extent the common objection to such chimneys. A very large per cent. of fires come from defective chimneys.

Water-Proof Canvas.—According to the *Milling World*, sackcloth or canvas can be made as impervious to moisture as leather, by steeping it in a decoction of one pound of oak bark with fourteen pounds of boiling water. This quantity is sufficient for eight yards of stuff. The cloth has to soak for twenty-four hours, when it is taken out, passed through running water and hung up to dry. The flax and hemp fibers, in absorbing the tannin, are at the same time better fitted to resist wear.

Caring for Harness.—This is the season of the year when every person using a harness should see that it is properly cleaned and oiled, to secure its durability. If this were done there would be a great saving in the wear of it as well as in the comfort of the horse, which, above all other things, should receive the best of attention. There are many who get a new harness and wear it out in a short time, just for the want of a few good oilings. The more it is used in mud and rain the more care it should have. To clean a harness, take a small tub of lukewarm water, dissolve about two ounces of sal soda, and when your harness soaks a short time you can make quick work of it with a stiff scrub-brush. When almost dry, use good oil freely.

Cleaning Gilt Objects.—Gilt articles, if of metal, may be cleansed by rubbing them gently with a sponge or soft brush moistened with a solution of half an ounce of potash, or an ounce of soda, or, perhaps best, an ounce of borax, in a pint of water; then rinsing them in clean water and drying with a soft linen rag. Their luster may be improved in certain cases by gently heating them, and then applying gentle friction with a soft rag. A very dilute solution of cyanide of potassium will answer the same purpose, by applying it in the same manner as above, washing in water and finally drying by gentle friction with a linen rag; but as this substance is very poisonous, it is not to be recommended for household uses. Gilt frames of mirrors, pictures, etc., should never be touched with any thing but clean water, gently applied with a soft sponge or brush.—*Manufacturer and Builder.*

Railroading in Europe and America.—What is known as the Vanderbilt railroad system, when completed, will, it is stated, be the greatest system in the world, and reach the most productive agricultural, manufacturing and commercial territory in this country. It now consists of the New York Central and Hudson River railroad, 450 miles and four tracks; Lake Shore, 550 miles double track; Canada Southern and Michigan Central, 550 miles double track; Northwestern, 4,500 miles; Nickel Plate, 550 miles; or a full 66,000 miles of double and quadruple track, not to speak of thousands of miles of side tracks, etc. In addition to his large interest in each of these railroads, Mr. Vanderbilt has blocks of Rock Island and Burlington stock.

Germany's Linen Industry.—Half a century or so ago Germany controlled the linen markets of the world. Then the industry was crushed down by war in the Fatherland, and Great Britain stepped in and monopolized the foreign business. Wars having ceased, Germany gathered herself together, and what is the result? During the last twenty years the industry has increased in Germany 300 per cent. In Great Britain it has decreased eighteen per cent. Germany now employs 200,000 persons in flax-spinning, and Great Britain 150,000. The wages in both countries are about the same, but the purchasing power of the money is greater in Germany, and the condition of the operatives is in every way better than in Great Britain.

Good Health.

The Wholesomeness of Canned Foods.

There is much apprehension among many respecting the possible poisoning of canned food, now so largely used, by the action of the acids contained therein on the metal of the cans, or the solder used to seal them. This apprehension is doubtless not altogether without foundation in fact; but if the results reached by Mr. Francis P. Hall, and reported in the *Popular Science Monthly*, are to be believed, there is little to be feared on the score of poisonous adulteration of food from these sources.

The report in question refers to a series of experiments undertaken by Mr. Hall on the action of the vegetable acids—acetic, tartaric and citric—on lead and tin, and, as our contemporary puts it, "the results seem hardly to bear out the assertions that are made respecting the danger of lead-poisoning from tinned goods." It is stated by the investigator that the most danger arises from the solder, and from the action of the acids on the tin itself. He found that the rate at which corrosion takes place does not bear a direct relation to the strength of the acids, but that, in the case of canned fruits, it takes place very rapidly after opening the can, indicating, therefore, the advisability of emptying a can at once after it has been opened.

Mr. Hall also reports as the results of his examinations of bright tin-plate that he has not discovered, in even the cheapest specimens, sufficient lead to warrant the inference of intentional adulteration. He finds that tin foil, often used as a wrapping for various articles of food, is sometimes very pure tin, and again is heavily adulterated with lead.

These conclusions, which appear to have been reached after a faithful series of examinations of the several grades of tin-plate entering into the manufacture of cans for preserved food, should serve to assure those who may be apprehensive of the danger of lead poisoning from this cause, that it is far less serious than has frequently been affirmed.

An Alleged Cure for Hydrophobia.—Some interest is felt on the assertion lately made, on the authority of a leading physician, that the "woorari," a poisonous drug prepared and used by a number of tribes of South American natives, was a certain specific against the terrible and hitherto incurable disease known as hydrophobia. Several authentic cures are reported to have been made with its aid. Little is known of the method of concocting this subtle substance, and but little of its nature, save that it is highly poisonous; and doubtless a number of substances are prepared and sold by this name. The natives use it as a specific against the bite of venomous serpents, and also upon the tips of their arrows and other offensive weapons. In poisonous doses it produces paralysis.

In Germany, Dr. Offenberg recently attracted the attention of the medical world by successfully treating a hydrophobia patient with a species of woorari obtained from the Indians of Brazil. The announcement of this fact soon attracted attention in this country, and similar trials of the remedy here, as above stated, have proved equally satisfactory.

It would prove a boon, indeed, to humanity should these very hopeful assertions prove to be correct. It would add another to the many beneficent services of medical science, and it would rob of its horrors one of the most terrible and fatal of diseases.

Bad Teeth and Dyspepsia.

While every one is liable to suffer, at times, with indigestion, no matter how well preserved their dental organs may have been, there can not be found to-day one whose teeth are decayed, broken off, and out of order generally, that does not suffer continually with "heartburn," or some of the multifarious gastric troubles incident to such a condition of the oral cavity.

Persons having no teeth, or those whose teeth have been neglected and allowed to become diseased, are unable to masticate their food properly, which is deficiently mixed with saliva (a very essential auxiliary in the digestion of solid substances); and therefore, this food, being carried into the stomach without proper trituration and insalivation, imposes double duty upon the gastric apparatus—that of mastication and digestion.

Again, carious teeth serve for lodgment of particles of food which are retained in and about the organs until fermentation is set up. Friends, did you ever think of it, those whose teeth are rotten and rotting, that your mouths are regular cesspools? And this putrescent matter is conveyed into the stomach continually with the saliva, and consequently produces an irritation of the lining membrane, which is the worst and not uncommon form of dyspepsia, which is impossible to cure (not with even 999,999,999 patent medicines now in the market) until the dental organs have first received proper attention. Indeed, cases of dyspepsia of years' standing have been permanently cured by judicious attention to the oral cavity, and without medicinal agents to any extent, when, on the contrary, all the medicines that can be given will not effect a cure until the *cause* is removed.

Nay, more than this: in all mouths where there are tartar-covered and decaying teeth there are millions of *leptothrives buccalese* (*microscopic parasites*) which are also carried into the alimentary canal, and it may be produce other complicated diseases the origin of many of which are now unknown.

How Salt Injures Flesh Foods.—A French physician, Dr. Hussen, has been making experiments to discover the effects of salt and other condiments when used in cooking, and adds his testimony to the facts already in possession of the hygienists. His experiments show, among other things, that in cooking butchers' meat only an ounce of salt should be used with from six to twelve pounds of meat. If more is employed, it will do one of two things: it will modify the structure of a portion of the muscular fiber so as to render it more resistant to the action of the gastric juice, or it will itself check and retard the peptic fermentation, the very groundwork of digestion. It follows that salted and smoked meats are more indigestible than fresh. Vinegar, it appears, may be used with good effect, provided it is not in a quantity to irritate the stomach, and it is a pure dilution of acetic acid, freed from sulphuric or hydrochloric acids; the latter of which, though an active principle of the gastric juice, must not be in excess in the stomach, or it will retard digestion. The hungry man will, therefore, be careful how he uses salt and vinegar, and Dr. Hussen will by and by tell him something about pepper and mustard.

Cold Drinks in Indigestion.—Sufferers from certain common forms of indigestion forget the effects of loading the stomach with cold liquids. Cold drinks are often depressing, and the peculiar form of indigestion just now very prevalent, in which food is retained an unreasonable time in the stomach, is in a large proportion of instances the direct effect of persistent chilling of the gastric organ by copious draughts of cold drink.

Dangerous Cosmetics.—Dr. C. H. Von Klein has made the observation that the cutaneous irritation so frequently found upon the foreheads of fashionable ladies is the result of the quince-seed mucilage used for the purpose of arranging the "bangs" and other nonsensical flub-dubberies.—*N. Passing Events.

Among miners just now the Coeur d'Alene placers, Idaho, are attracting the most attention. Miners are leaving Salt Lake now with the intention of being on the ground early in Spring; and some persons suppose that by May next there will be 1500 or more prospectors in the region. Miners from Montana, Wood River, and elsewhere are preparing to go.

The Manufacturers' Association, to which we have before referred, has regularly organized and incorporated, and we give elsewhere a statement of its purposes. It will be in a position to accomplish much good to the manufacturers of this city and vicinity when in full running order.

The whaling fleet is coming in one vessel after another, and in a few days all the Arctic whalers will be in this port. The steamers have had the best luck, though the catch has been poor all around. It is probable that more steamers will be built here. A large factory and refinery is to be put up here, a local company having been organized for the purpose. It is probable that San Francisco will do the bulk of the whale oil trade of this country hereafter.

At the Alta mine, on the Comstock, they are now going down to the 2150 level to stay. They are taking down with them a supply of pure air by means of a partition that is being placed in the main shaft. As fast as the planks of this partition are put in position, there is a following draft of cold air down on one side and up on the other.

Cross Lodes.

This is the season for doing assessments on mining claims for the year now drawing to a close, and a great deal of such work will be done before the last day of December next. The law upon this point is now generally well understood, and we do not deem it necessary to enlarge upon the subject. The law requires an annual expenditure of $100 in improvement upon each claim, and unless such a sum is actually expended in good faith, within the prescribed period, the claim is subject to relocation.

The question of rights of miners in reference to cross lodes is, however, not so generally understood, and as many such cases exist, in which the claimants of cross lodes continue to do the assessment work, some honestly believing themselves entitled to the lode "to the point of intersection of the main lode," and others holding on simply for blackmail purposes, we propose to give, for the benefit of all, the law and the latest decisions on cross lodes.

Section 2322, General Mining Laws of the United States, is as follows: "The locators of all mining locations heretofore made, or which shall hereafter be made, of any mineral vein, lode, or ledge, situated on the public domain, their heirs and assigns, when no adverse claim exists on the 10th day of May, 1872, so long as they comply with the laws of the United States, and with state, territorial and local regulations not in conflict with the laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes, and ledges throughout their entire depth, the top or apex of which lies inside of such surface locations; but their rights of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward, as above described, through the end lines of their locations, so continued in their own directions that such planes will intersect such exterior parts of such ledges; and nothing in this section shall authorize the locator or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim over or possessed by another." And section 2336, referring to cross lodes, reads as follows: "When two or more veins intersect or cross each other, priority of location shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection; but the subsequent location shall have the right of way through the space or intersection, for the purpose of convenient working of the mine; and where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including the space of intersection."

We can give no better nor clearer explanation of these sections than to quote the gist of a recent decision by the United States Court of Colorado, in a case of cross lode controversy, in which A had made a location on a main vein, and subsequently another location upon a cross lode which intersected with the vein of the first location. He sold the first location to B, and afterwards laid claim to the ore in the cross lode within the surface lines of the first location, which he had sold to B. The case was tried by the State Court of Colorado, and decided in favor of A. B then appealed the case to the United States District Court, which tribunal reversed the ruling of the State Court, and in doing so gave the following explanation of the law, which has been accepted, according to our information, by all the United States Courts: "The act of 1866 allowed surface ground for the convenient working of the lode or vein, and for no other purpose." The Act of 1872 enlarges the rights of the locator by a grant "of all veins, lodes and ledges, the top or apex of which lie within his surface lines;" still his right to surface is dependent upon his right to the principal lode, and his right to other lodes within his surface limits is equally dependent. This enlargement of the rights of the locator was doubtless intended to stimulate his enterprise by increasing his reward; but the controlling reason was to prevent the controversies which were constantly arising respecting veins or lodes connected or associated with the lode claimed. These controversies obstructed the full and proper enjoyment of the principal lode granted, and the design was to settle and prevent them. In this, and in the case of surface ground, it was intended to grant that which was associated with the principal lode by proximity within prescribed limits. A mineral vein or lode is a term in both acts. There must be a Code discovered and appropriated by compliance with the requisites of location. This is the prominent and pronounced subject of the grant. This is what the miner had discovered and claimed by right of discovery. The security of his title thereto was the practical necessity with which the Act of 1872 dealt. All else we think incident thereto—under the Act of 1866, the right of the surface ground; under the Act of 1872, both the right of the surface ground and to other veins, lodes, and ledges. The principal lode constitutes the measure of the miner's right to the surface ground, as the surface ground, when determined, in turn constitutes the measure of his right to other veins, lodes, and ledges.

Men and Events in the Pioneer Days—No. 2.

[Prepared for the MINING AND SCIENTIFIC PRESS, by HENRY DEGROOT.]

Why Fremont Failed to Discover Gold.

Having in a preceding number of these papers related all that was known as to the existence of gold in California prior to January, 1848, we come now to consider some of the principal actors in, and the circumstances that led to, that event. Before entering upon this subject, it may, perhaps, be proper to state that some surprise has been manifested that John C. Fremont failed to discover gold at an earlier date, seeing he was sent out by our government to explore the country, was accompanied by a competent mineralogist and geologist, and arrived here nearly two years before the find occurred at Sutter's mill. It is argued that, having been dispatched on such special mission, and being aware that some placers had previously been found and worked in the southern part of the state, he ought to have struck gold somewhere along his route, inasmuch as it led down the south fork of the American River, on which the great discovery was afterwards made. But to this it may be replied: General Fremont, with his command, consisting of sixty-two frontiersmen, scientists and guides, entered the country in an exhausted and famished condition, having been forced to slaughter his pack animals to save himself and his men from starvation, and to cross the Sierra in the dead of winter. He was therefore obliged to push on to Sutter's Fort with all possible expedition, and having stopped there for a few days to recuperate his men and animals, he hastened forward to Monterey. Arrived at that place, then the capital of the Department of Alta California, the Mexican authorities, suspecting that Fremont meditated some revolutionary movement, at once attempted to drive him and his party out of the country. What with resisting this attempt and the active part he took in effecting the conquest of California, the Great Explorer had quite enough on his hands for the next two years, without thinking about or hunting after gold. That General Fremont actually did make an important discovery of gold, and refrained from giving publicity to the fact, as a few have surmised, is, for obvious reasons other than the above, a hypothesis with hardly the shadow of a reason to rest upon.

General John A. Sutter.

The most prominent character connected with the epoch in California history under consideration, and the most noteworthy of all our pioneers, was born in Switzerland, in the year 1805. Bred to the life of a soldier, after distinguishing himself as a captain in the armies of France, he emigrated to the United States. Arriving at New York in 1834, he at once proceeded west, going as far as New Mexico, where he tarried for a time. Not liking that country and having heard much of California, he joined a party of trappers and crossed the continent, going, contrary to his intention, first to Oregon. From the rebe took ship to Honolulu, whence he voyaged in like manner to California. This circuitous route was taken to reach his point of destination for the reason that there were then no vessels running between Oregon and Yerba Buena, while the overland journey was one not easily made. On reaching California our adventurer at once made his way up the Sacramento River, and there, near the junction of that stream and the American Fork, erected, in August, 1839, the fort that afterwards bore his name, he having been guided to this spot by the descriptions of the old beaver hunters, with whom it had been a favorite camping ground, and who had recommended it to him as an eligible site for an agricultural establishment and trading post.

This accomplished, Sutter engaged in carrying out his purpose of growing wheat and manufacturing it into flour for the Russian settlement at Bodega, and of raising horses and cattle on an extended scale. For effecting his plans, a flouring and a saw mill became necessary. The former, a large three-story frame structure, was built only a few hundred yards without the walls of the fort. The nearest place at which timber suitable for making good lumber could be obtained being on the south fork of the American River, distant about 35 miles from the fort, Captain Sutter determined to put up a saw mill at that point. The business of getting out the timber and constructing this mill was intrusted to

James Wilson Marshall.

Who, assisted by a small company of white men and Indians, commencing work in the fall of 1847, had the building about completed and ready for running by the end of that year. Marshall, who was born in New Jersey, in 1812, and brought up to the trade of his father, a coach and wagon maker, emigrated, when about twenty-one years of age, to Indiana, where he worked for a time at carpentering. Leaving that state, he sojourned for a while in Illinois, whence he made his way to the Platt Purchase, in the state of Missouri. Here he engaged in farming and trading, and being tolerably prosperous, made up his mind to settle permanently. But a severe and protracted attack of fever and ague shook this good resolution out of him, and, as a means of escaping the dread disease, he finally concluded to come to California. This determined upon he made due preparation, and joining a company having a train of a hundred wagons, left about the first of May, 1844, on his journey overland. As the safest way for reaching California, Marshall with a portion of the company, took the route through Oregon, where they wintered, and starting out the next spring came on to California. Reaching Sutter's Fort in the month of July, 1845, Marshall there made a halt, working afterwards most of the time for Captain Sutter.

When the Bear Flag war broke out Marshall joined the American party, and did good service in the field. Hostilities ended, he returned to the fort and was soon after employed to take charge of the mill-building business, an enterprise that he had some time before strongly urged Captain Sutter to engage in.

Finding the Gold.

In regard to this event there are several versions extant. All, however, agree as to the main facts, their differences relating for the most part to unimportant particulars. Marshall's account of this affair, which has been generally accepted as entitled to credence, is about as follows: Finding the race he had dug below the mill not quite deep enough, he had adopted the plan of hoisting the gate and letting on a full head of water, for the purpose of washing it out to a greater depth. Walking down the race one morning to see what progress he was making with this work, he noticed a small piece of yellow metal lying in a crevice of the soft granite, which at that point composed the bottom of the race. Picking it up, he began to ponder what it might be, having an impression from the first that it was gold. Its weight and the crude tests he was able to make of this metal—such as pounding it between two stones and finding it malleable—so tended to confirm this idea that Marshall thought it best not to say much about the matter just then, for fear it might cause the men employed under him to quit work and go to gold digging. But for all that the notion that this metal might be gold gradually spread among the men, who failed not to notice that Marshall continued to look after and pick it up, he having in the course of a few weeks collected from the mill-race several ounces of it. This incident, afterwards fraught with such momentous consequences, occurred on the 19th day of January, 1848—not 1849, as stated in Hittell's excellent and generally accurate work on California—this error in date being a mistake of the printer, and not of the author.

Peter Wimmer, who was with Marshall when he found the first piece of gold, had also gathered a small quantity. Taking a portion of this, his wife, who did the cooking for the men, had subjected it to to what was considered a crucial test, boiling it in a decoction of strong lye. As the stuff stood this trial without tarnishing, it was concluded on all hands that it must be gold; and so a feeling of interest began to show itself among the employees about the mill, despite the efforts of Marshall and Wimmer to conceal the real facts and suppress the growing excitement.

Meantime, Marshall having occasion to go to the fort, took some of the metal he had collected along with him, and showed it to Captain Sutter, who proceeded to test it with nitric acid, whereby its true character was fully established. Comprehending the importance of the find, Sutter accompanied Marshall on his return to the mill, where he soon satisfied himself that the precious metal existed in such quantity as would be likely to work an early revolution in the then existing state of things. Nevertheless he found the men still at work, and affecting to treat the gold find lightly, managed to keep them busied for some days longer, until the mill was fully completed and a small stock of logs gotten in.

By this time the news of the discovery had reached San Francisco, to which place a man named Bennett, one of the hands at the mill, had gone, taking some of the gold dust with him. Among others who happened to see this sample was Isaac Humphrey, who, having formerly worked in the gold diggings of Georgia, as soon as he beheld it not only pronounced it good gold but expressed the opinion that much more would be found where this came from. Such was the confidence of this Georgia miner in the new discovery that he left San Francisco about the end of February, and in company with Bennett went up to the mill. Arriving there on the 7th of March he found the men still at their work, none of them having as yet gone to gold digging. After prospecting a little with a pan, Humphrey constructed a rocker, such as he had been accustomed to use in Georgia, and, commencing on dirt taken from the mill race, washed out from one to two ounces of gold dust daily.

The News Spreading, and Its Effect.

This result of Humphrey's few days' washing put an end to all further operations on and about the mill. Work of every kind was in fact abandoned, all the whites in the vicinity building rockers and betaking themselves to gold washing. Even the mill, which Sutter and Marshall had so exerted themselves to complete, for a time stood idle. Getting in logs came to an end; building ceased; every thing but gold digging was for the time being suspended. Everywhere, as the tidings spread, business

*This series of articles will be issued in a new form, with other matter, during January, 1884.

came to a standstill. San Francisco was emptied of its adult male population. The American settlers residing in the valleys geared up their teams and set out for the mines, some of them taking their families with them. The rancheroes and the vaqueroes mounted their mustangs and started for the new El Dorado, driving their pack animals before them. And thus the country, before so quiet and inanimate, was now all astir: the whole population being moved by a single impulse—the eager thirst for gold.

So extensive was this movement, which may be said to have commenced about the middle of March, that there were collected in the mines before the end of the year as many as ten or twelve thousand men. While the most of these were residents of California, many of them came from Oregon, Mexico and the Sandwich Islands, with a few from Central and South America. As population flowed rapidly into the mines, so also was the business of gold gathering speedily extended over a broad stretch of country, having been in the course of a few weeks engaged in at widely distant points. Coming to Sutter's Fort about the middle of March, from his ranch at the head of the Sacramento Valley, Pearson B. Reading visited the site of the new gold discovery. Finding the appearance of the country similar to that in the vicinity of his ranch, he returned home, and taking his domesticated Indians, was engaged before the end of the month washing out gold on Clear Creek, nearly two hundred miles to the northward of Coloma. John Bidwell, another large ranch owner in the Upper Sacramento Valley, having, in like manner, visited Sutter's Mill, returned and went to work with his Indians on the bars of Feather River, nearly midway between Clear Creek and Coloma. Towards the south the gold-seeker also made his way, pushing out in that direction as far as the Tuolumne before the season was over; so that mining by the end of the first year was being pursued at intervals along a linear extent of more than two hundred miles.*

Manufacture of Charcoal in Kilns—No. 3.

Conical Kilns.

The conical kilns are generally smaller than either of the other varieties before described. They are usually from 20 to 25 feet in height and from 25 to 30 feet in diameter, and are intended for 25 to 45 cords of wood. They are constructed in such a way as to require no bracing of any kind. They are often built into the side of a bank, a part of the earth of which is removed so as to make a charging-door near the top on a level with the ground; or they may be built on a plain, in which case there is no upper door but only a charging hole in the top, which is reached by a ladder in order to close it.

The usual dimensions of these kilns are:

	Diameter at base, feet.	Height, feet.	Capacity, cords.
American Fork Canyon Utah	26	20	25
Norton's Iron Works, Plattsburg, N. Y.	30	20	35
Wassaic, N. Y.	30	23	40
Readsboro', Vermont	28.6	28	45

There are three types of this kind of kiln, shown in Figs. 6, 7 and 8. 1. That at Readsboro', Fig. 7, in which the top of the cone is at a different angle from the bottom; there are two doors of the same size for charging. 2. That at Wassaic, Dutchess County, N. Y., Fig. 6, in which the cone has but one angle; there are two charging doors of slightly different size, and a hole in the top of the kiln to be used in firing. 3. That at Plattsburg, No. 8, in which the conical form is the same throughout; there are two charging doors, one below, and the other in the top of the kiln. This last form is on the whole the best of all, being the simplest in construction and easiest to manage.

At Readsboro', Vt., Fig. 7, the walls are 12 inches thick at the bottom, but at a height of 7 feet 4 inches they diminish to 8 inches. From this height upward all the bricks are laid in headers. At the height of 23 feet the kiln is capped by another cone, which is 5 feet 4 inches high, and of much flatter angle. The details of construction are different in different localities, but the principle of all the kilns is the same. At Wassaic, Fig. 6, the walls are made 30 inches thick at the bottom, diminishing gradually to 14 inches at the top, which is made flat for a cast-iron vent-hole. On one side a doorway, 7 feet high and 6 feet wide, is built out, into which a sheet-iron door fits against flanges made for the purpose. On the line of the American Fork Canyon railroad the bottom walls are carried up vertically on the outside to a height of five feet, where there is an offset. At the bottom the walls are 18 inches thick; at the offset they diminish to 1 foot in thickness. The interior is, however, conical throughout. The foundations are of the same thickness as the lower walls, and, as they are in earth, are 10 feet in depth.

At Norton's Iron Works, near Plattsburg, N. Y., Fig. 8, the wall is built with a batter 3 inches to the foot up to 5 feet. At this point, the height of the kiln being determined as 20 feet, a perpendicular is raised, and somewhere on this line a center is found from which an arc of a circle will meet the flange of the charging hole at the top, which is made of a cast-iron ring 4 feet in diameter and 8 inches deep, projecting 6 inches over the top. This makes the wall a little thinner at the top than the bottom. The flange of the ring is normal to the curve of the masonry, which is generally built of red brick (Fig. 8 shows the way this kiln is constructed). Sometimes the kilns are made of stone, which need only be strong enough to resist the low heat of the operation. Constructed in this way the kiln requires no braces of any kind. When the kiln is built against the side of a hill, the upper charging door is generally made of the same size as the lower one, but in Utah it is only 4 feet square. These doors usually have iron frames. Sometimes the upper part of the door-frame is directly under the top of the cone, as at Wassaic, Fig. 6, and in Utah; the lower one is then on a level with the bottom of the excavation made in the side of the hill. Sometimes the upper door is much lower, as at Readsboro', Fig. 6, and is connected with the woodyard by means of a bridge. At Plattsburg the kilns are built on a plain—the top opening is reached by a ladder. The discharge door is square, and has a cast-iron frame 6 feet high and 4 feet 6 inches wide. It is best to put in at the top of this door-frame a rod ¾ of an inch in diameter, to prevent the tearing of the wall by expansion. The door itself may be in one or two pieces.

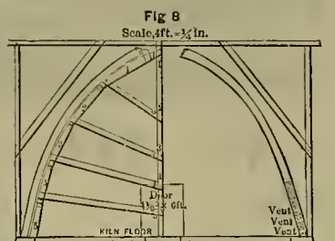

Fig 8

Scale, 4ft. = ½ in.

CONICAL CHARCOAL KILN

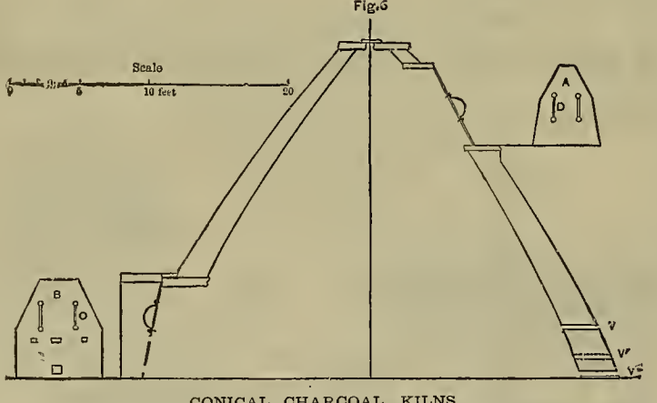

Fig. 6

CONICAL CHARCOAL KILNS.

It takes 33 M. Brick to construct the Plattsburg kiln. About 40 M. brick to build the one at Readsboro'. The floor of the kiln is very nearly level, and on the sides comes up to the bottom of the lower tier of vents. It is usually 4 inches higher in the center than at the sides. It is generally made of clay 8 to 12 inches thick, and must be well beaten with mauls and very carefully tempered. The kiln has 3 rows of vent-holes, which usually commence on the level ground.

Each kiln is usually constructed to hold 35 cords of wood, solid measure. This is intended to yield 1,750 bushels, which is 50 bushels to the cord. Either soft or hard wood can be burned; the former is generally used in the manufacture of blooms, and is preferred by many workmen.

To charge the kiln, skids two inches in diameter are laid three feet apart, keeping the ends up to the outside. They must be placed in the radii of the circle, for if the smoke is at all confined it will cause an explosion. The wood used is cut 4 feet 8 inches long, and is of all sizes from four inches to two feet in diameter.

A fireplace or chimney four feet square is made in the center of the kiln, and carefully preserved in the filling to the top. An air-channel is made from it to the opening in the lower door. This is filled with shavings, brands and light wood, thrown in loose, which when the kiln is lighted is fired with a long pole from the door.

The yield of the kilns at Norton's Works is often as high as 60 bushels per cord for hard, and 50 for soft wood. The average is about 50 bushels.

There are 13 kilns here, and 4 at 12 miles distant, built of firestone, which hold 50 cords each. It requires 8 men for the 13 kilns. These 13 kilns can make 22 turns a year. Working an fast makes it difficult to burn the charcoal thoroughly, so that they usually run only 18 kilns a year. It requires 13 days to fill, burn and empty a 35-cord kiln. It takes one day to fill, and one to empty it.

In Utah the charcoal is packed in bags, containing 2 to 3 bushels, which are hooked up under an opening 18 inches square in a table 3 feet high. This table is 4 feet square on the top. The charcoal is thrown on to the table and pushed into the bags. Six men will empty a kiln, sack the charcoal, and put it on the cars in one day. The wood is mostly poplar, which is cut dead. The charcoal is very light, and so much was lost by this method that it is now proposed to ship, in cars constructed for the purpose, without packing. It takes 9 to 10 days to burn a kiln. At the end of 5 days all the vents are closed, and they no longer watch it. The fire is extinguished with water; it is not allowed to die entirely. The kilns are whitewashed after every operation. Poplar costs $3 per cord. Pine costs $3.75 per cord. Six men do all the work. The loss in fine coal is very large. The charcoal made from those very soft and often dead woods is very light, so that it crushes by its own weight, and bears transportation very badly. The use of such woods is, however, partially justified by the fact that the coke for the lead furnaces costs in this locality $45 per ton. Thirty-five cords of wood make 1,000 to 1,200 bushels, of 2,680 cubic inches each, of charcoal, or about 45 bushels to the cord. In 1875 the contract was made to deliver at American Fork at 18 cents a bushel.

It seems to be very generally conceded in the Eastern States that the conical kilns holding from 25 to 35 cords are the most profitable. They are less expensive in construction, more easily filled, cheaper to manage, give a better yield, and can be turned more frequently than any of the other varieties of kilns.

Statistics of Conical Furnaces.

Diameter or length, inside in the bottom	28	feet.
Height to spring of arch	19½	feet.
Capacity in cords	35	
Number of thousand brick	33	
Number of vents	94	
Weight of cast iron vent-holes, each	14	lbs.
Pounds of cast iron	3,000	
Pounds of wrought iron	1,000	

A man remains about the kiln all the time.

1	1	6	1	1	0	0	3	1	4	2	5

Cost per hundred bushels	$0 85
Foundation 50 P. of stone, 3 to 4 feet are required, costs	100 00
Bricks $5.50 per M., laying in wall $4.50 per M.	320 00
Cast iron for frames, vent-holes, etc., 1 ton	75 00
Total cost of furnace	$495 85

At Plattsburg, in 1879, it cost $7.50, on Lake George $7, and in a few localities in Vermont $6 per thousand bushels to fill, burn, and empty; the average will be from 6 to 7 cents.

The per cent of brands in a well-burned kiln will be from one cord in 17.5 cords to one in 18.5. It takes for a 50-cord kiln 12 days, for a 35-cord kiln 9 days. The charging requires 1 day for 4 men for 35 cords, and 1 day for 5 and 6 men for 50 cords. Two horses are used for the 35-cord kiln at Plattsburg, but the whole work is done by men with wood barrows.

	50 cords.	35 cords.
Days charging	1	1
Men employed charging	5 to 6	4
Horses used	barrows	2
Number of days burning	10	6 to 7
No. of men employed burning	1	1
No. of days discharging	1	1
No. of men discharging	3 to 4	2
No. of horses	2	2
Yield of wood in bushels	50	50
No. of bushels of charcoal to cord wood	50	
Weight of bushel	20 lbs.	(soft, 11 to 14 (hard, 15 to 19

The cost of these kilns will vary with the locality, depending on the local cost of the materials used. It will cost about $500 to build a conical kiln, of from 35 to 50 cords, in Plattsburg, and about $600 in Michigan, with brick at $17.50 per thousand. There seems to be no doubt that the Plattsburg kiln, with iron vent holes, is the best type of all the kilns.

SMELTING FURNACES.—A contract has been concluded with the Arizona Copper Company, owners of the Clifton and Longfellow mines, for three of the Fraser & Chalmers improved 42-inch water-jacket furnaces for treating copper ore. The entire order is for about 200 tons of machinery, and includes an automatic engine of 110 horse-power, one of 35 horse-power, one of 25 horse-power, two steel boilers 60 inches by 15 feet, three Leffel water-wheels, for use when water is plenty, a No. 6 Comet crusher, two large sized Blake crushers, 186 sets of ore-gates for ore bins, three No. 6 Baker blowers, and all accompanying machinery. Messrs. Fraser & Chalmers have also received an order from the District Copper Company, of Clifton, Arizona, for one of their copper furnaces, and have recently shipped the Concordia Smelting Company, Mexico, a complete copper plant. The same firm has also an order in hand from the Benson M. and S. Company for a 60-ton oblong galena furnace, similar to the one previously furnished by them.

OLD miners who formerly operated in Stockton, Ophir and Dry Canyon, Utah, are returning to these camps to again try their luck. Development work done in the past six months convinces them that there is a bright future before the districts which once produced so much ore.

C. H. AARON, one of the oldest and best assayers and metallurgists in the west, has come to Prescott to work and make it his home. His assaying rooms are in rear of Huhhard's cigar store, Montezuma st.—*Prescott, Ariz., Courier.*

CONSIDERABLE outside capital will be invested in Utah mines this winter.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

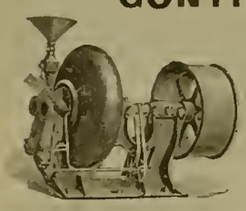
Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Piuo Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.



HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Hagg n or Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanica in design a nd of first-class constructi m. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

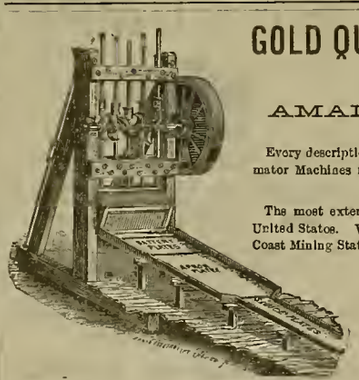
HYDRAULIC GRAVEL ELEVATORS.

The Great Problem of Shallow Hydraulic Mining Solved.

NEW FIELDS OF ENTERPRISE IN HYDRAULIC MINING OPENED UP.

These machines are thoroughly effective for working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.



No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon.

At the property of the Yreka Creek Gold Mining Company, in Siskiyou county, Cal., an Elevator of the Improved Form has been introduced, which, with a head or pressure of water of 266 feet, is elevating through an 18-inch machine to a vertical hight of 46 feet from bedrock to upper flume.

☞ Descriptive Catalogues and prices furnished on application to the undersigned, who are the sole manufacturers of these machines.

Disposal of Tailings.

The Case of the Spring Valley Mining Company.

In the PRESS recently we gave briefly the decision of Judge Keyser, of the Superior Court of Butte County, in the case of Allen S. Noyes vs. Spring Valley Hydraulic Gold Mining Company. Many persons thought this decision had a direct bearing on the debris question, but it had not. In fact, the Spring Valley Company, who have paid large sums to the Miners' Association, asked that association to take up the defense of the case. The association, however, refused, on the ground that the question was a local one, not bearing on the general "debris" proposition at all. Some of the editorial comments of the papers in this state show that the facts are by no means well understood. In conversation this week with the Superintendent of the mine, we have learned many points which will be of interest to the mining community:

The nominal plaintiff in the case is Allen S. Noyes, but the real plaintiff is Wm. H. Parks, of Marysville, late speaker of the House. Parks and Noyes own all of the swamp and overflowed land in the sink of Butte Creek, east of the creek, aggregating about 500 acres.

This land forms the natural sink of Butte Creek, and was, we are told, purchased from the state as swamp and overflowed land for the sum of fifty cents an acre. The sink of Butte Creek is a tule swamp, which has never been nor can be cultivated. The land lies only a short distance from the Sacramento River, with which it is connected by means of the Butte Slough. As soon as the Sacramento River commences to rise a portion of it runs out through this slough and fills the basin called the sink of Butte Creek, and floods all the land owned by Parks & Noyes. During high water this land has been flooded to a depth of sixteen feet, and every year the land is under water to a depth of several feet, which remains on the land, or on a large part of it, until the month of July. During the past summer the land was entirely dry. It produces a rush grass of little value for grazing or for hay.

The old Spring Valley Company allowed the water from the mine to flow down to and upon this land during the summer or dry season. As soon as the present company was informed in regard to the flow of water on this land, it immediately took measures to prevent any further damage (if it can be called a damage, to flow water taken from Butte Creek back into the sink of Butte Creek) to Noyes & Parks' land.

The testimony as to the deposit of slickens was entirely in favor of the mining company, which produced in court samples of both the deposit on the land and the water standing on it. Neither of these samples showed any slickens or tailings from the mine—the Spring Valley mine.

This mine is situated at Cherokee, Butte County, and has been worked since the early days of California. It is elevated about 1,000 feet above the Sacramento Valley, and is distant about 40 miles from Parks & Noyes' land. In the year 1872, a large supply of water was brought to the mines by means of ditches, flumes, and iron pipes, at a cost of several hundred thousand dollars. The sources of supply are Butte Creek, 1,800 miners' inches, and west branch of Feather River, about 400 inches. This amount of water, to wit, 2,200 inches, is led to the mine through a thirty-inch iron pipe. The pipe can not carry more than the above amount, so there can have been no increase of water during the past eleven years. The debris from the mine is run into Sawmill Ravine, which empties into Dry Creek. Dry Creek ran across the Sacramento Valley. During the summer time it was dry, and during the winter its waters emptied into the sink of Butte Creek.

By the constant use of this large supply of water, the debris from the mines began to fill the ravines, and soon flowed down and filled a part of Dry Creek. The owners of the mine, finding that the debris was fast threatening destruction to agricultural lands, commenced the purchase of these lands, and expended more than half a million dollars in these purchases and in the construction of a canal. This canal commences about eight miles below the mine, and extends across the valley for a distance of more than 20 miles. It is a half mile wide in places, and at no point is less than 400 feet. It is constructed with two levees on each side. The side levees are about 30 feet apart. The space between the side levees is being constantly filled up and the banks raised by causing the sediment to be deposited by means of cross dams which retard the flow. The heavy material is deposited near the mine. The fine gravel and sand flow down and are deposited in the bed of Dry Creek, upon lands owned by the company. At a point about 6 miles below the mine a substantially built brush dam (not one of Parks' Yuba dams) has been constructed. By means of this dam not only all the sand and heavy material but also a large amount of the so-called slickens are caught and retained. Nothing but the very lightest material which is held in suspension is allowed to flow into the canal. This sediment is being continually deposited in the side channels, until it reaches a point near the lower end of the canal, where by means of a dam it is turned out into Keppel Lake, covering about 200 acres. The water being brought into this lake on one side and taken out on the other is freed from all earthy matter. From this lake the water (clear enough to drink) is turned into Butte Creek, the same stream from which nearly all the water was taken to the mine. This is a fair and truthful statement of the case for the greater part of the year.

Let the facts for the balance of the year be presented. The canal above mentioned was constructed of sufficient size to carry the water of all the streams which drain the land lying between the water-sheds of Butte Creek and Feather River. During a heavy storm the canal carries from fifty to one hundred times as much water as is used at the mine. During the winter there is a large flow of natural drainage water through the canal. This water would naturally have flowed down Dry Creek, the terminus of the canal being in the bed of Dry Creek. The water is now discharged at the same point it would have been discharged had no canal been constructed.

It is impossible during heavy storms to turn so large a body of water out of the canal and into the lakes. It is therefore allowed to flow out through the end of the canal. From the end of the canal down to Parks & Noyes' land the distance is six miles. The mining companies own a continuous body of land comprising about 4,000 acres between the end of the canal and Parks' land. This land is covered with tules, rushes, willows and grass, so that the water from the canal is filtered and all sediment is deposited before it reaches Parks & Noyes' land or lake, for at such times as the water is allowed to escape through the lower end of the canal the land owned by Parks & Noyes is entirely covered with water. This lake at times reaches up to the terminus of the canal. It can not be claimed that the land is damaged by water, when it is already flooded to a depth of several feet. Besides, the amount of foreign water used at the mine is only 400 inches, the balance being from Butte Creek, and would flow into this lake if not used by the miners.

Such are the facts as they were brought out before Judge Keyser. Such are the facts as they really exist. Can any fair-minded man say that the mining company did not have good reasons for defending this suit and good reasons for expecting a fair decision on the facts? The mining company in this case does not claim the right to flow water or debris on agricultural or grazing land. All that is claimed is to use the waters of Butte and other creeks and turn the same, free from sediment, into Butte Creek or into the sink of Butte Creek when the same becomes a lake. This is the right which Judge Keyser has denied by injunction.

Miners generally have little hope of winning a suit in Sutter County. Judge Keyser found "that now more than half of plaintiff's land is kept continually covered by water, etc., from defendant's levee;" yet we are told the Judge, when he previously visited the land, found it entirely free from water. He found, also, "the water when it leaves the lake near the end of the canal still laden with sand, sediment and light matter," though when he visited the lake with several gentlemen representing both sides, he is said to have drank of the water after it flowed from the lake. The findings also show that a part of the water, after passing through Keppel's Lake, still flows into Dry Creek and down on plaintiff's land; yet when the Judge visited the tract he found in crossing Dry Creek that it was dry in name and fact. The Court also considered that the canal was not necessary to the working of the mine, and evidently did not consider the only testimony on this point, which was sworn to by several witnesses for the defendant, to the effect that the issues could not run unless permitted to run through the canal.

In conclusion, it may be stated, that as the Spring Valley Company is not able to continue the purchase of lands until it owns the whole of the Sacramento Valley, or that portion of it lying south of its canal, it may be compelled to cease mining for a part of the year, until it can perfect another system of disposing of its tail water.

IT is seldom that you will feel unwell or suffer from indigestion if you use Brown's Iron Bitters.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Oh, My Back!

That's a common expression and has a world of meaning. How much suffering is summed up in it.

The singular thing about it is, that pain in the back is occasioned by so many things. May be caused by kidney disease, liver complaint, consumption, cold, rheumatism, dyspepsia, overwork, nervous debility, &c.

Whatever the cause, don't neglect it. Something is wrong and needs prompt attention. No medicine has yet been discovered that will so quickly and surely cure such diseases as BROWN'S IRON BITTERS, and it does this by commencing at the foundation, and making the blood pure and rich.

Wm. P. Marshall, of Logansport, Indiana, writes: "My wife has for many years been troubled from pain in her back and general debility incident to her sex. She has taken one bottle of Brown's Iron Bitters, and I can truthfully say that she has been so much benefited that she pronounces it the only remedy of many medicines she has tried."

Leading physicians and clergymen use and recommend BROWN'S IRON BITTERS. It has cured others suffering as you are, and it will cure you.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Ageney, the following are worthy of special mention:

CAISSON GATE.—George F. Schild, Vallejo, Cal. No. 287,178. Dated, Oct. 23, 1883. This is an improved caisson or floating gate for harbors, canals, river locks, deep-water basins, and the different kinds of drydocks. It consists in a gate formed of a plate shaped like and adapted to fit the entrance of locks, harbors, or docks, on a peculiar boat-like structure or buoy, connected with it, to keep it afloat and upright, and in means for sinking or floating said gate and buoy, consisting of certain water tanks and peculiar valves. The gates which are ordinarily used consist of two leaves swinging on parts below, and in straps above water. A great amount of mechanieal foree is necessary to operate them, causing much wear. Repairs are eostly. The caisson gates which are generally used are boat-like, floatiug structures, the keel and stems of which fit into grooves at the entrance of harhors or docks, and prevent the water flowing out or in. These caisson gates are very heavy. The object of this invention is to provide a floating gate or caisson gate which will be light and easily handled, requiring no stationary ballast to lower it and keep it steady, and no pumps to raise it.

THRASHING MACHINE AND SEPARATOR.—Samuel Hamilton, Salinas, Monterey Co. No. 287,925. Dated Nov. 6, 1883. It is a fact well known to those familiar with the art that the eylinder of a thrashing machine is capable of thrashing two or three times as much grain as the cleaning-shoe can separate and clean, and if the thrashing cylinder is fed up to its capacity or forced, the mass of straw becomes so great that, in addition to the grain which goes to the shoe not being properly cleaned, much is so entangled with the straw that it is never separated or gets to the shoe at all, but is lost by being carried out at the tail end with the straw. Mr. Hamilton's invention relates to certain improvements in these machines, and it consists of a duplex arrangement whereby the straw and waste from the straw-carrier and cleaning-shoe respectively are conveyed through a second and similar apparatus, the two being continuous and automatic.

HYDRAULIC PORTLAND CEMENT.—William Jones, S. F. No. 287,941. Dated Nov. 6, 1883. This invention relates to a new and useful process of manufacturing or forming what is known as hydraulic Portland cement, and it consists in the treatment of argillaceous limestone or dolomite containing an excessive quantity of clay (silicate of alumina), with lime or its carbonate, and in subsequent steps. Heretofore Portland cement has usually been made by an artificial mixture of lime and clay. In argillaceous limestone or dolomite there occurs this mixture naturally; but seldom are the proportions requisite for the manufacture of the cement. More frequently there is too small a quantity of lime and an excess of clay. Consequently, such argillaceous limestone or dolomite is worthless for making the cement. The object of this process is to utilize such limestone or dolomite by adding thereto the requisite amount of lime.

INCUBATOR.—Chas. F. Winkler, Bakersfield, Cal. No. 286,756. Dated Oct. 16, 1883. This invention relates to certain new and useful improvements in that class of incubators employing an endless traveling conveyor for receiving and advancing the eggs. The object is to overcome certain difficulties now existing in this class of machines. It is so constructed as to allow the introduction of a fresh lot of eggs at short intervals, and gives to each lot its own required temperature. The machine hatches the eggs in small batches, removed from the unhatched eggs, so the temperature is not lowered in removing them, nor are they injured. The machine provides for the different temperatures necessary to hatch out all kinds of eggs—goose, duck, turkey and chicken, giving each its required time and temperature.

LOOM FOR WEAVING BAGS.—John Laird, Jr., Forfar, Scotland, assignor to Wm. Rutherford, S. F. No. 286,711. Dated October 16, 1883. The invention has special reference to looms for weaving fabrics in which the eloth has at definite intervals or spaces to be woven into rough cloth for the purpose of forming the bottoms or sides of such bags, sacks or similar articles, according as the said artieles are woven with their length lying longitudinally or transversely with the web or warp of the cloth. The object is more especially to render the whole of the operation in connection with the weaving of such goods or fabrics, and especially the bottoming and weaving operations, automatic.

IF YOU want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. Co., for "Lubrice." It is the best compound-grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Colorado, Utah and Montana.
M. H. JOSEPH—Eureka, Nev.
I. M. LEHIY—San Bernardino and San Diego counties.
J. J. BARTELL—Santa Clara county
C. E. CURTIS—Kern and Inyo counties.
A. S. DENNIS—San Mateo county.
A. C. KNOX—Butte and Sutter counties.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.
It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.
While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

HERCULES POWDER

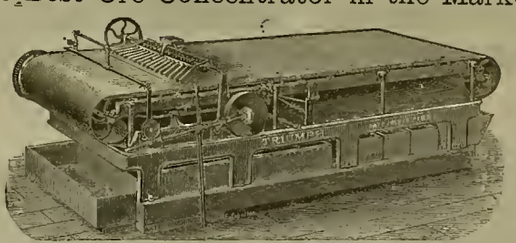
HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.



ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francieco, Cal.

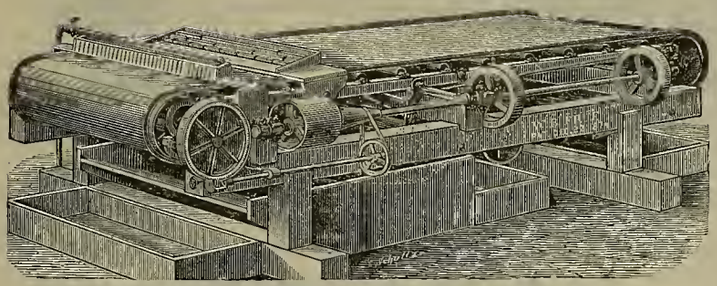
NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.



Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

Dewey & Co.'s Scientific Press Patent Agency.

No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

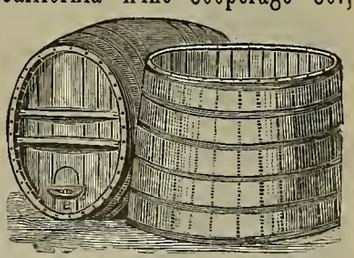
THE ROLLER ORE FEEDER.

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.



In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

The Clayton Improved Air-Compressors.

Our illustration this week shows the "Clayton Improved Duplex and Double-Acting Belt Air-Compressor," with pipe and belt connections, etc., as in actual work.

These compressors are extensively used in working rock-drills, coal-cutting machines, underground pumping, etc., and are made to supply a demand where compressed air at a pressure of 50 to 200 pounds is required. These compressors are geared on crank shafts so as to give an even strain on cranks. The cranks are made of the best wrought iron, and are placed at right angles; the connecting rods are of improved pattern, the cross-heads have composition gibs, and work on slides of wide wearing surface; the pistons are metallic, with a series of rings made of the best composition or phosphor-bronze, and will last a long time and remain perfectly air-tight.

THE CLAYTON AIR COMPRESSOR.

These compressors are driven by a heavy pulley, which acts also as a fly-wheel, and gives a steady motion, and the entire machines are built very strong.

The cylinders are encircled by water jackets of recent design; the water is received into the jackets through pipes, which may be seen in pairs connected with the top of the cylinders near the center, such partitions being placed in the jackets as force the water to circulate from the center along the top to and around the ends of the cylinders for one-fourth of their length, at which points the greatest compression of the air takes place, and consequently the most heat is generated, and then passes around the center of the cylinders, discharging at the top, thus equalizing the temperature of the middle of the cylinder to the same degree as the ends and top. Thus, the water-jackets can never be without water, as they could be if the water was discharged from the bottom.

Notice is especially called to the fact that in these compressors there are no sliding valves, rotary valves or so-called positive moving valves, for the admission of the air, as it is claimed that such valves produce much friction and wear, and can be kept tight only a short time. The induction and eduction valves are both placed in the cylinder heads, and are so arranged that the valves and seating can be unscrewed and removed by taking off the covers. Disks of a semi-elastic material are interposed between the valve faces and seats, which protect the metal surfaces from wear, besides being quickly and cheaply replaced when worn.

The suction valves which form a most important part in a good air-compressor are of the poppet style, having flat faces and a slightly elastic disk between valve and seat, which disk takes all the pressure and protects the metal surfaces against wear, and keeps the valves tight, they being subjected to no sliding or rubbing motion.

The suction valves are very numerous, and give plenty of opening for air admission until the cylinders are filled to almost the atmospheric pressure; they are placed in the air-cylinder heads, which experience has shown is the proper place for the inlet valves, and all danger of their falling into the cylinders through the stems breaking or the nuts coming off the stems is now overcome by the introduction of the "patent safety stems" or bolts, which effectually secure the valves from falling into the cylinders, and enable the engineer to put the nut on again without taking off the head; or should the valve-stem break, the valve may be fastened against the seat until it is convenient to repair it.

The following partial list of the mines and improvements which are using the Clayton Air-Compressors shows the popularity in which these machines has attained, viz.: Northern Pacific railroad; Bismark, Dakota; Portland, Oregon; Ainsworth, Washington Territory; Hudson River tunnel, New York and New Jersey; Callao mine, South America; Monte Cristo gold mine, California; Highland Mary mine, Colorado; Moose River Gold Mining Co., Nova Scotia; Silver Peak M. & S. Co., Colorado; Sullivan Mining Co., Maine; American Emma Mining Co., Utah; Equitable Silver Mining Co., Colorado; Equator Mining Co., Colorado; Lebanon Mining Co., Colorado; Mass. and New Mexico Mining Co., N. M.; South Barcelona mine, Nevada; Bonanza and Union Tunnel and Mining Co., Colorado; Rossie Iron Works, Bay State Iron Co. and Chateaugay Ore & Iron Co., New York; Hecla Iron and Mining Co., Ohio; Albion Mining and Milling Co., Michigan; Breece Iron Mining Co., Colorado; Green Pond Iron mines, N. J.; Musconetcong Iron Works, N. J.; Hastings Iron Co., Ontario; Morris Run Coal Mining Co., Morris Run, Pa.; (This is an eighteen-inch diameter by twenty-four-inch stroke duplex air-compressor, and is employed in running the Harrison coal-cutting machines, two flywheel water pumps and a hoisting engine in the mines); Burlingame and Scranton Coal Mining Co., Kansas; Trinidad Coal and Coking Co., New Mexico; Osceola Copper Mining Co., Michigan; New Almaden Quicksilver Mining Co., California; Bergen Post Zinc Mines, Pa.; Missouri Valley and Blair Railway and Bridge Co., Iowa; U. S. Government Works, Flood Rock, N. Y. Harbor (who are using a Clayton Duplex Air-Compressor for supplying air to the divers engaged on the work); Bradford Gas Light and Heating Co., Bradford, Pa. (who are using three No. 4 and one No. 9 Clayton Duplex Air-Compressors, which compress the gas at the natural wells at Rixford and force it a distance of thirteen miles, heating and lightning the city of Bradford); Jamaica Government railways (Parus and Ewarton extensions), West Indies; etc., etc.

The new building for the Clayton Steam-Pump Works, which is one of the largest and most substantial buildings in that section of Brooklyn, was completed in May of the present year, and is located near the approach to the New York and Brooklyn Bridge; the large wire sign on the roof, "Clayton Air-Compressors," being distinctly visible the entire length of the bridge. It requires but ten minutes from the City Hall, New York, to reach these Works via. the Bridge Cable railway, now running.

The works are equipped with improved machinery and they propose to build and keep in stock, ready for prompt delivery, a full line of the Clayton Improved Air Compressors, of capacity to run from one to fifty drills.

Copies of their new catalogue, October, 1883, estimates and general information, will be furnished on application to the Clayton Steam-Pump Works, 45 and 47 York Street, Brooklyn, N. Y.

The Pennsylvania railroad is now building a gigantic inclined plane at Pittsburgh, up which teams and freight and passenger cars will be hauled by means of steel cables, now being made by the Hazard Manufacturing Company, of Wilkesbarre. The plane has a total length of 840 feet, the rise being nearly 43 feet in the hundred. It is built on arches. The longest span is 232 feet, another one is 120 feet, and the rest 60 feet each. The cables to be used in hauling up cars are entirely of steel, and will be the largest steel cables ever made in this country. The engines which will furnish the motive power are nearly completed, and will be of 700 indicated horse-power. The total cost of the gigantic structure, complete, will be $275,000.

CORRESPONDENCE.

Recollections of California Mining Life.*

Men and Events in the Pioneer Days -No. 3.

[Prepared for the MINING AND SCIENTIFIC PRESS, by HENRY DEGROOT.]

General Sutter's Account of the Gold Find.

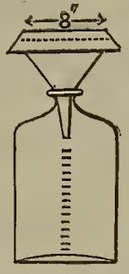
Before going on to further notice the changed condition of things produced by the discovery of gold in California, it may not be out of place to say a few words touching the accounts of that occurrence as given by different parties who had some agency in bringing it about or were in a position to speak authoritatively on the subject. General Sutter's version of the affair, as imparted by him to the writer, varies but little from that of Marshall, as already recounted. According to General Sutter's statement, Marshall, leaving the mill sometime near the end of January, 1848, came down to the fort, where he arrived towards evening wet, and covered with mud, the day having been stormy. His visit was unexpected, as he had been to the fort not long before. After talking a little about other matters he told his employer or partner—Marshall always claiming to have been interested with Sutter in the saw-mill business—that he had some important information to impart to him, so much so that he wished to see him apart and where no one could see or overhear them. Complying with his request Sutter took him into his private room, but having neglected to lock the door, a clerk entered just as Marshall, plucking a rag from his pocket was about to exhibit its contents. Alarmed at the interruption, he quickly replaced the package, and when the intruder left insisted on having the door to the apartment locked. This done, he again pulled out the package, and undoing a much soiled rag, exhibited two or three ounces of yellow metal, which he informed his employer he believed to be gold. Sutter was of the same opinion, and after reading a description of that metal in an encyclopedia which he happened to have at hand, proceeded to experiment on the dubious material with nitric acid, whereupon he found it to be unmistakably gold. So much was Marshall excited over the matter that he declined to remain at the fort over night, but left at a late hour and in a heavy rain to return to the mill, after exacting from Sutter a promise that the latter would follow him in the morning, which he did.

General Sutter relates that, despite the storm, which still continued, he started at an early hour the next day for the mill. While on his way, and when out about twenty miles, he saw to his surprise a man come out of the chaparral a short distance ahead of him. Riding up to the spot, he found this to be Marshall, who had already since leaving the fort been to the mill, and, there procuring a fresh horse, had returned thus far, when, overcome with fatigue and loss of sleep, he made a halt, crawled into the bushes and took a nap. When Sutter came up, having so refreshed himself and rested his animal, he had already gotten into the saddle and was about resuming his journey towards the fort. When interrogated as to his object in returning so soon, nothing very definite could be gotten out of him; the pretense that he had come on to meet the General and see that he did not miss the trail being evidently no part of his real purpose, as Sutter had already been over the road, which, being well marked by wagon travel, could not easily be missed. The truth was, that Marshall had become so excited when it was shown that the stuff he had picked up in the mill-race was really gold that he could neither sleep nor rest until he had his partner on the ground and something as to their future course of action had been determined upon. Hence this speedy setting out again for the fort, the poor man, in his anxiety, fearing that Sutter, an easy-going sort of person, might delay his coming, or, not fully appreciating the importance of the occasion, might fail to come altogether. This frame of mind on the part of Marshall sufficiently refutes the idea entertained by some that he was long in doubt as to the character of the metal he had found, and little conscious of the consequences likely to grow out of that event. He was not long in taking measures to confirm, what from the first he suspected, that the metal was gold, nor did he fail to comprehend the results that might be expected soon to follow.

On reaching the mill Sutter entered the race with Marshall, and walking down it picked up with his own hand several particles of gold. Adding these to some other pieces given him at the time by the workmen, he had a ring manufactured therefrom, on the inside of which was engraved the following inscription: "The first gold discovered in January, 1848."

The First Piece of Metal Picked up by Marshall, and Mrs. Wimmer's Version of the Gold-Find.

While the sentence as above inscribed was in some sense true, this ring of General Sutter did not actually contain the first piece of gold picked up by Marshall, though that is still in existence, and capable of being identified by many persons who at different times have seen and handled it. Owing to its size, shape and other peculiarities, persons who have once seen this piece of gold have no difficulty in recognizing it when shown to them again. It is rather flat, rough on all sides, of irregular shape and weighs about a quarter of an ounce, its intrinsic value being not quite five dollars.



Mrs. Jane Wimmer, wife of Peter Wimmer, who, as already stated, was cooking for the men at the mill, gives the following account of the discovery of gold, the circumstances under which it occurred and the history of the first piece of metal picked up. Her husband and Marshall, she says, were walking together down the race, when they saw this piece of metal, both at the same time, though Marshall being a little ahead was the first to pick it up. Neither of them knew what it was, though both surmised its true character, her husband being so impressed with the belief of its being gold that he brought it to her and insisted on her boiling it in lye, which was accordingly done. After standing this test so well, Wimmer, satisfied that it must be a noble metal, urged Marshall to take some of it to the fort and submit it there to further trials, which the latter consented to do, Wimmer staying at the mill and looking after the men and the work during his absence.

Marshall carefully preserved this first piece of gold for a time, saying he intended to have a ring made from it for his mother. But finally, being about to go away, having taken out a good deal of gold dust, and fearing he might lose this first piece of gold, he gave it to Mrs. Wimmer, both as a souvenir and as a means of greater security against its being lost. This occurred in the summer of 1848, and Mrs. Wimmer, who is still living, being a resident of San Luis Obispo County, has retained the specimen in her possession ever since. Though not rich, she has refused many liberal offers for it, being unwilling to part with it unless assured that it would be retained among the pioneers of California, or at least be kept in the state. Some years ago the Society of California Pioneers attempted to treat with Mrs. Wimmer for this interesting relic, which, owing to a failure of negotiations, still remains in the hands of its long-time owner.

*This series of articles will be issued in a new form, with other matter, during January, 1884. Rights reserved.

A Simple Rain Gauge.

EDITORS PRESS:—I think some of your readers may like to have a simple form of rain gauge, and I have pleasure in sending you directions for making one, at an outlay of but a few cents, that will serve every purpose where an exact scientific record is not demanded.

RAIN GAUGE.

Let the tinsmith make a funnel with a small—say one-quarter inch—opening at bottom, and having a two-inch band soldered round the top, as shown in sketch, to prevent the rain that falls within it splashing out again. The upper edge of this band must measure an exact 8 inches in diameter. Take a good large bottle—an ordinary wine bottle will serve, but in localities where the rainfall is heavy something larger is preferable—into this bottle measure 3½ fluid ounces, and mark the bottle at the water level: so on till the bottle is filled, marking the water level of each added measure of 3½ ounces.

Each of these gradnations shows one-eighth inch of rainfall. For convenient reference the gradnations may be marked on a strip of paper and gummed outside the bottle.—J. W. F., Stocktou.

CHROME IRON.—A discovery was recently made in this county which possibly may lead to the development of another of the many industries for which the county is famous. C. Borger, Superintendent of the Campo Seco Copper Mining Company, on the 10th of October, made a location of a chrome-iron lode in the John Bull mining district. Mr. Borger took some of the ore with him to San Francisco a few days ago, and an assay determined that the ore contained about forty-five per cent of chrome. Chrome iron is usually found in deposits, but in this instance it is found in leads or lodes, from one to three feet in width, and the formation is similar to that of quartz. There is considerable excitement in Campo Seco and vicinity, and quite a number of locations have already been made. As the discoveries are within a few miles of the proposed terminus of the S. J. and S. N. R. R., it may prove quite an important industry.—*Calaveras Citizen.*

COPPERAS.—The estimated production of copperas in this country during the year 1882 was 15,000,000 pounds, having an average spot value of three-quarters of a cent per pound. This material is largely made from the waste oil of vitrol from wire and galvanizing works, with scrap iron. It is also made from alum shale. The principal centers of production are as follows: Worcester, Mass.; New Haven, Conn.; Buffalo, N. Y.; Philadelphia, and Johnstown, Penn.; Cleveland, and Steubenville, Ohio; and St. Louis, Missouri. Its principal uses are in paper and print mills, bleacheries, dying establisments, chemical manufacturing establishments, paint and ink manufactories, and for sanitary purposes as a disinfectant.

Astronomical Notes.

The following short papers were read before the California Academy of Sciences at its meeting of November 5th, by the President, Prof. Geo. Davidson, of the U. S. Coast and Geodetic Survey:

Note on the Appearance of Saturn.

Upon turning the 5.4 inch equatorial of the Davidson Observatory upon Saturn about nine o'clock in the evening of October 29th, it was at once made evident that the object was unusually steady for this region.

I had failed to get any transit observations because the spider lines of the reticules of the instrument were so limp and slacked up by moisture in the atmosphere that they were unfit for work. Even when they had been heated and straightened out, they lost their tension in two or three minutes. The evening was clear and pleasant, and nearly calm, and the smoke of the city was to the southeastward. The atmosphere was charged with aqueous vapor, and the dew ran down the observatory almost like rain.

With a moderate power the division of the ring of Saturn was visible all around, and the gauzy or dusky innermost ring was made out. With a higher power the details came out marvelously clear and sharp, notwithstanding frequent shiverings of the image from atmospheric disturbance. The dusky ring was wonderfully well defined on its inner edge, and the main division of the principal ring was distinct and well cut; the division of the outer ring was made out further than given in the well known Cambridge drawing. The shadow of the planet on the ring was so well defined that the irregularity at the subdivision of the ring was unmistakable, the equatorial beltings were better defined and more marked than in the drawing referred to; the equatorial region was whiter than towards the poles; the line of dark clouding along the south border of this white belt was very distinct and in marked contrast therewith; the edge of the planet was traced around on the ring by its difference of color; the faint yellow green olive tint of the planet was in marked contrast with the white of the ring; the principal ring was toned faintly down as if exhibiting some of the features of the gauzy ring, but the separation of the two was distinct. There were six satellites visible. But one of the best revealed features of this spectacle was the undoubted difference in brightness of the gauzy ring at the two ansæ. The preceding part was decidedly brighter than the following ansa. Different eye-pieces and different powers were used, but this peculiarity remained. Mr. Marr noted it under all the circumstances in which I examined it. I have no doubt whatever of the matter. This phenomenon may have been described before, but I have no remembrance of meeting with it. I thought also that the inner edge of the gauzy ring was more than half way from the inner edge of the principal ring to the body of the planet; but under examinations with different powers and eye-pieces, I had some doubts. I made no measures.

Another feature was the apparent deeper shading of the preceding side of the planet: it was only a very little difference, but I was satisfied that it really existed.

I should mention that in my limited experience in examining Saturn I have never seen the atmospherie conditions so nearly perfect as they were that night. It was an exceptional instance in very many years. In this one case I saw more than is given in the beautiful Cambridge drawing.

Solar Eclipse, October 30, 1883.

The predicted time of the first contact of the moon's limb with the sun, and the point of contact, were computed for the Davidson observatory.

This predicted time was 3 hours 46.1 minutes; and the point of contact was 248 deg. 59 min. from the north point reckoned round by the east, corresponding to 203 deg. 43 min. from the vertex of the sun also reckoned through the east.

The observation was made with the full aperture of the 6.4-inch equatorial, using Airy's double-image micrometer, with a power of over 200 diameter. The color-glass exhibited the sun's disk of a whitish pearl color. The position thread was placed to cut off that segment of the sun's disk upon which the moon would first appear. The clockwork kept the image in the center of the field.

The border of the sun was much disturbed by the unequal refraction of the warm and cold strata of the atmosphere, so that the first contact was obtained under certain difficulties. The moon appeared exactly at the predicted position, and the local meantime of the contact was 3 hours and 46 minutes and 14.6 seconds, or eight seconds after the computed epoch. It is probable that this time may be a half or even one second late.

After this observation another eye-piece was introduced, and the projected image of the sun's border was exhibited upon a white paper screen, showing the ingress of the moon's dark limb, the groups of sun spots, and the disturbed border and cusps.

The time of greatest observation occurred just before sunset, when the moon had advanced .454 sun's diameter on the disk of the latter. Owing to the abnormal refraction so near the horizon, the sun presented the appearance of a very flattened eclipse, and the moon's disk was also similarly distorted, so that the distortion of the cusps was very striking and peculiar. At that time the boiling of the sun's border was excessively great.

There were two lines of sun spots across the solar disk, one north and one south of the equator; some of them were very large, and one group was visible to the unassisted eye. The faculæ upon the surface were fairly well made out.

The geographical position of the Observatory is: Latitude 37 deg. 47 min. 24.1 sec. north; longitude, 122 deg. 25 min. 37.6 sec. west, or 8 h. 9 min. 42.5 sec. from Greenwich.

A Brilliant Meteor.

On the evening of October 29th, at 11 o'clock, a remarkably brilliant meteor passed vertically downwards very near to Eridani (3 mag.). It illuminated the street, and its light cast a strong shadow. The train, about 5 deg. long, was persistent for three or four seconds, with an intense, vivid brightness, then faded away to a white, vaporous looking streak, which assumed a wavy motion for three or four seconds and then vanished. The color was an intense white, tinged with a purplish hue; and the brightest part of the train which was left was not at the point of disappearance but about the middle of its length.

Alum.

Native Alum.

Alum appears in the form of an efflorescence on argillaceous rocks in the Silver Mountain district, Alpine County, California, but the deposits are too light to be of much practical value. In the early part of 1875 the discovery of what was termed an alum lode was reported to have been made on Howell Mountain, Napa County, California. As is often the case with these reported finds, much was claimed for the extent and purity of this deposit; but as a very little alum from that locality ever found its way to market, the first accounts of this discovery were presumably much exaggerated. Some of the springs of the Geyser group, Sonoma County, also small springs near Owen's Lake, carry a small percentage of alum. Certain clays found in Santa Clara and Calaveras counties, in the same state, show a strong taste of alum; but if any valuable deposits of this mineral have ever been found in the Pacific division, the fact has not become generally known.

Alum occurs in small quantity at Mount Vernon, and in Jefferson County, Col. In other parts of the Rocky Mountain region small quantities of the mineral are found, but nowhere in economically available bulk.

Artificial Alum.

The alum of commerce is a manufactured commodity, and the supplies consumed in this country are both of the imported article, and that made in a few chemical works in the Eastern States, chiefly in Pennsylvania, New York and New Jersey, from alum shale, clay, etc. In the census year ending May 31, 1880, the production of artificial alum in the United States was 39,217,725 pounds, valued at $808,-165.

The production of artificial alum in 1882 amounted to between 16,000 and 20,000 tons, which at two cents per pound would be worth from $640,000 to $800,000. Nearly all was made from alum clays brought from France and England but the manufactured product is said to be superior in quality to that imported from England. The process of manufacture is very simple, consisting in mixing the clay with sulphuric acid, dissolving the sulphate of alumina thus formed, and then adding a solution of sulphate of ammonia and crystallizing the resulting salt. The leading manufacturers are Messrs. M. Kalbfleisch's Sons, of New York City and Buffalo, Chas. Lennig & Co., Harrison Bros. & Co., and Powers & Weightman, of Philadelphia; and the Pennsylvania Salt Co., of Philadelphia and Pittsburgh.

Gold Saving.

Peter Eddy and J. G. Hartwell, of Nevada City, received letters patent for a new form of amalgamator and grinder, the object of the invention being principally to render profitable the further reduction of quartz tailings known to contain free gold, but classed as of too low a grade to be worked with the ordinary apparatus now in use. The following are among the special claims of the inventor: A machine of ordinary size has a capacity of treating all the pulp that comes from a five-stamp battery, and can be geared to grind little or much as may be desired without sliming or impairing the condition of the sulphurets for concentration, but rather bringing them to a uniform size, which will increase the capacity of the concentrator, as it is continuously separating the previously slimed particles and light waste from the heavy and valuable particles, grinding only that portion that requires to be ground. The wearing parts of the machine are of such a character as to be worn down evenly. They consist of shoe and dies that do not plow through the pulp, as is the case with the common grinding-pan. The shoe and dies may be worn much thinner, on account of the even wear, before being replaced. The machine being of such large capacity for treating low-grade ores or tailings, it is destined to work its way between the concentrators and the battery, on account of its rapid and improved qualities of separating, amalgamating, and little or much grinding as may be required.—*Transcript.*

MECHANICAL PROGRESS.

Cast Iron of 47,500 Pounds Square Inch Tensile Strength.

The average tensile strength of cast iron being 25,000 pounds to the square inch, the extraordinary strength of the mixture below given demands the widest circulation among engineers. If it can be made uniform, it increases the usefulness of cast iron very greatly. Edward Gridley, member of the Institute of Mining Engineers, says, in *Van Nostrand's Magazine*: "A little more than a year ago, at the Wassaic furnace, Dutchess County, N. Y., we made a few hundred tons of iron from a mixture of two thirds raw carbonate and one-third Chateaugay ore, hoping that it would be suitable for steel purposes, but as the iron showed phosphorus .189 per cent, it was not offered. This iron looked well and seemed strong, and gave good results in malleable castings, but no special tests of strength were made. About February 1st, of this year, we began using two-thirds roasted carbonate and one-third Chateaugay, and noticing that the iron was stronger than usual, we had two samples tested, which showed tensile strength of 32,014 and 34,176 pounds per square inch. After our stock of Chateaugay ore was exhausted we put on one-third raw carbonate with the two thirds of roasted carbonate, and the first test made of the iron showed 40,008 pounds per square inch. The three tests given above were made by Mr. A. J. Copp and Mr. E. B. Manning, of the Phœnix Furnace, Millerton, N. Y. Since these tests were made they have broken samples made with all carbonate ore as follows: 39,669, 40,816, 41,882, 42,281, 39,902 and 40,130 pounds per square inch. A test taken from the same bed of iron as the last mentioned, 40,130, was broken, showing 40,151 pounds per square inch. A sample broken at Stevens' Institute, under direction of Prof. R. H. Thurston, showed 40,000 pounds per square inch. Another sample was broken by Prof. Thurston on his torsion machine, and gave torsion 7° and tensile strength of 44,500 pounds. And still another sample, tensile strength 47,500 pounds per square inch. The average of the thirteen tests by Fairbanks is 41,349 pounds. These tests were all made from iron cast in the pig-bed, direct from the furnace. Some were made from the full pig turned down, but most of them from samples obtained by making a hole in the sand at the end of the pig, from 10 to 20 inches long and about 1¼ inches in diameter. No tests have yet been made from the remelted iron."

Engine Details.

Nothing is more interesting than the very different and sometimes opposite opinion on the construction of the details of machines or steam engines. One would think that the superlative could be decided scientifically if the subject was carefully studied and no great divergence from the best for the place and purpose be seen in articles from the best designer's hands. Yet we are told by some that the halved box for an engine shaft, babbitted and bolted, is the best. The more ancient designer retains his old opinion of the quarter-box with good adjustable wedges, and it is the best, money not considered. The engines having the halved box are in no need of cheapening the construction to secure trade; in many instances, therefore, that form is best at any price, presumably. From the user's standpoint, his experience is the relative amount of trouble had with the thing. He will not always carefully discriminate between the proper and improper usage, and in many cases condemns unjustly. This is brought up for thought on the complaint of an engine with a bent crank and bolted half-boxes, that it pounded and had cost a great deal of annoyance and the customer was unsatisfied after a year's use. The box gets the blame — it may be in the care, it may be in the defective construction of some other part, an unbalanced crank or pulley, or the pound may be elsewhere. If everybody used this form of box and approved it, the user would not complain. Now, how nice it would be if we could lay before such complainants that our plan is the best and give good honest reasons. There is in machinery a great difficulty in determining the location of a fault. Cases are known where several good men could not agree. A recent narrative of locating a pound by the indicator may lead experiments in a direction that will be profitable.—*Cin. Artisan.*

LEAD-LINED JOURNAL BOXES.—The remarkable performance of some lead lined brass journal boxes on a certain railroad ought to cause a careful investigation of their value by machinists generally. These boxes, when first put in, at once take a bearing over their whole length, and as the thickness of lead is a mere nothing, the maximum being but little over one thirty-second inch, the journal soon obtains a well fitted bearing in the brass without any danger of heating or cutting. There is an old story current among Eastern railroad men of a car loaded with valuable perishable freight which ran into one of the Springfield depots with journals badly cut and boxes on fire. It was a question how to save the freight by getting the car through to its destination at once. The remedy was a peculiar one. A brass was extemporized and made to fit the journal by putting in strips of sheet lead, so as to get a bearing for its whole length. The combination brasses were slipped into place, well oiled, and the car sent on its journey. The remarkable part of the thing, however, was that shortly afterwards the car reached Springfield on its return with the identical brasses still under it. It had evidently got through all right, and nobody had seen any occasion to find any fault with its performance.—*Mechanics.*

Testing the Physical Changes of Metals.

A paper was read at the recent New York meeting of the American Society of Mechanical Engineers, by Prof. Thomas Egleston, on a a machine for observing the physical changes of metals. The machine was suggested by the breaking of a railway rail, different portions of which, when subjected to the ordinary tests, were found to exceed the required degree of strength.

The paper was prefaced by a short account on the breaking of rails and the fatigue of metals, in the course of which the author advocated discarding the term hardness and substituting abrasive resistance. The term hardness was remarked to convey no distinct meaning, signifying in some cases brittleness, in others toughness, and in still others comparative softness. Without going into particulars, we would here state that Prof. Egleston's method of testing the hardness of metals, or their abrasive resistance, as he would term it, embraced the use of a drill in connection with the specimen to be tested. This special point elicited considerable discussion, Mr. Towne suggesting that the operation of cutting the metal scarcely seemed to be a fair test, its accuracy depending upon the temper of the cutting tool, its angle, temperature of the material, and other equally important factors. Again, when using a drill as in the machine described, different portions of the tool worked at greatly varying speeds, and one of the members thought that by first drilling a small hole in the specimen operated upon, so as to allow only the more rapidly moving points of the drill to perform work, more satisfactory results might be obtained. The use of lathe or planer tools was proposed as still other remedies for what were considered as defects in the appliance. As already stated in the preceding remarks, the discussion in this case also gradually drifted away from the original subject, interesting comments being furnished as to the manufacture and composition of brass, copper and copper castings.

A NEW USE FOR BIRCH BARK.—The subject of absolutely water-proof cloth has long occupied the attention of scientists. Some years ago an Italian, Signor Muritans, supposed that he had satisfactorily solved the problem of Egyptian cloths being entirely indestructible, and he patented a material of the kind, the only objection to which was the cost. And now M. Peron, a Belgian, comes forward with an invention of a similar nature; having ascertained that bands used to smooth the heads of Egyptian mummies were impregnated with a kind of resin, he has had recourse to a substance from birch bark, and which is now used to perfume Russian leather. When the fine white bark of the birch tree is distilled it yields a red oil, nearly one-fourth of which consists of the special phenol or carbolic acid which gives a well known odor to Russian leather. It is now found that the residue or green tar of the birch yields neither acid nor alkaloid, and it forms with alcohol a solution of great fluidity, which, however, when once dried, is unacted upon by alcohol. It is this substance which will unite with the most brilliant colors, and is used by M. Peron for treating textile fabrics.

WATER JACKET FOR IRON FURNACE.—The Allentown *Chronicle* says: "The new water jacket furnace in Reading, Pa., owned by Henry S. Eckert, has now been in blast about one week, and up to this time the result has been very satisfactory; thirty tons of iron are being made daily, but it can be increased to forty. This is the only furnace of the kind in the United States. It was designed and built by David Campbell, the Superintendent of the furnaces. The jacket surrounds the furnace to the height of 19 feet 9 inches. It is made in sections, so that if any accident should occur to either section it could be replaced. Between the outer and inner plates of the upper section is a thickness of five inches of water, and in the lower section four inches. The fresh water is constantly running in above, and is allowed to flow off below through pipes. The experiment is watched with great interest by furnace men throughout the country."

PRESERVING WOOD.—An exchange says that a plan recently introduced into Belgium for preserving wood from decay produced by the atmosphere, water, etc., is to fill the pores of the wood with liquid gutta pereha, which is said to effectually preserve it from moisture and the action of the sun. The process employed consists in exhausting the air from the pores of the wood and filling them with gutta-percha solution. In pouring the solution into the pores, the solid gutta-percha is liquefied by mixing with paraffine in proportion of about two-thirds of gutta-percha to one-third of paraffine; the mixture is then submitted to the action of heat, and the gutta-percha becomes sufficiently liquid to be easily introduced into the pores of the wood. The gutta-percha, liquefied by this process, hardens in the pores of the wood as soon as it becomes cold.

SCIENTIFIC PROGRESS.

New Metallurgical Discovery.

At a recent meeting of the British Association, Prof. Chandler Roberts described some most suggestive experiments on the mobility of gold and silver in molten lead. Graham first ascertained the rate of diffusion of salts in solution; Dr. Guthrie has recently studied the diffusion in alloys; and Professor Roberts is now testing metals at temperatures above their melting points. If a lump of a gold lead alloy with 30 per cent of gold, covered with lead, is heated in a crucible, the gold appears at the surface the very moment when perfect fusion has been attained; the diffusion also takes place rapidly if the gold alloy is put in a small crucible, and this one placed within another crucible containing lead. By melting in a cylinder, 200 millimeters high, a solid cylinder of lead with a small piece of the gold alloy fused to its bottom, or, better still, by placing the gold at the top of one limb of a U-shaped crucible, withdrawing test portions from the top end of the other limb, Mr. Chandler Roberts arrived at the diffusion rate, 300 millimeters in five minutes for silver, this rate being probably a little higher than that of gold.

Sir William Thomson characterized this as a great discovery. The rate of diffusion of gold in lead, he said, appeared to be immensely greater than the rate of diffusion of liquids. The fact was, it was a subject of which we understood very little indeed, but which would probably prove of great value in metallurgy, where one example of it, the rapid mixture of spiegeleisen with iron, was well known. If the experiments were repeated with salt and water substituted for the gold and lead, it would take years—twenty years at least—to produce the result now attained in forty minutes, and which took place not much less rapidly than the diffusion of oxygen through hydrogen, or the transmission of heat through iron.—*Scientific American.*

MOTION OF GLACIERS.—It has been known for some time that there are long periods of time during which the Swiss glaciers advance down or recede up their beds. Thus, in 1741 they were advancing, but it was reported that in 1700 it was possible to walk from Chamounix to Courmeyer over the Col de Geaut without touching ice. They advanced all last century so far as is known, and up to 1817, then went back until 1840, advanced till 1859, and have since been receding till the present year, when many, including the Mer de Glace and the Rosenlaur glacier, have begun to advance. Observations were made during the past summer on the Glacier des Boissons, at Chamounix, and the important conclusion has been arrived at that the rate of motion of the same point on a glacier changes greatly from day to day. It was shown that while during the day the hourly rate or motion of one point observed was only .6cm., during the next night it advanced at the rate of 5.5cm. per hour. The rate of other points examined varied, but not so greatly. The change occurring at the foot of the glacier when it comes into the valley was also noticed. The downward motion of this point is determined by the fact that the parts above advance more quickly than the ice at the foot melts away. It was found that on one side of the glacier, where it rested against a bowlder, there was no apparent change in the outline of the ice or in the position of the bowlder during the day, while at the other side the end had moved in the same time 4 or 5 feet.

OCEAN FORMATIONS.—In discussing a paper upon the North Atlantic area, which, in the opinion of Professor Hull, was dry land when the regions of North America and those of Great Britain and Western Europe were submerged, Dr. Carpenter said before the British Association, recently, that the conclusion he had come to from the Challenger expedition was, that the bulk of the sea below the present sea level was to the bulk of the land somewhere about 20 to 1. He thought, taking the elevation of the different continents altogether, an elevation of 1,000 feet might be considered as about the average. On the other hand, the depression of the great oceanic area below the level of the sea might be stated at an average of about 13,000 feet. The elevations of land which in any way approached the same height were ridges, and one of the most remarkable facts brought out by the Challenger research was that there were strong reasons to believe that all oceanic islands were volcanic. In all their researches they found no indications of submerged land over these areas.

DISTILLATION IN VACUUM.—H. Schuller has observed the behavior of thirteen inorganic and twelve organic bodies when heated in a vacuum, their sublimations and distillations, and the nature of the residues. Many of the elements examined, especially selenium, tellurium, cadmium, zinc, magnesium, arsenic, and antimony, were capable of sublimation, while the very fusible metals, bismuth, lead, and tin, distilled with difficulty, the last mentioned scarcely at red heat. On the other hand, Demarcy found bismuth volatile at 202°, lead and tin at 360°, which Schuller explains by the presence of volatile impurities. During the whole time of the distillation of a metal an escape of gas was observed; but on repeated evaporation this phenomenon was imperceptible, or very slight. Sodium, selenium, tellurium, cadmium, zinc, arsenic, and antimony evaporate so readily in a vacuum that this method may be used for their purification. Among organic bodies many unstable mixtures, such as tallow, wax, and resin, distil so easily in a vacuum that they may thus be separated from impurities.

LIQUID OXYGEN AND NITROGEN.—We are slowly learning more of the liquid and solid states of the elementary and compound bodies formerly known as permanent gases. According to the latest researches, oxygen, when cooled to 213 degrees F., liquefies to a colorless transparent liquid at the very moderate pressure of 23 atmospheres, or thereabouts. Nitrogen at the same temperature does not liquefy at a pressure of 150 atmospheres, but yields a colorless liquid, with distinct menisens, when the pressure is cautiously allowed to fall to a point not lower than 50 atmospheres. It is now well known that ozone, under quite moderate limits of pressure and temperature, is a liquid of intensely blue color, which gives a vapor which can only be compared in color with the brightest blue sky. In this condition ozone is a most potent body, decomposing with explosion upon slight provocation into common oxygen. Pure alcohol is a white solid at about 202 degrees F. At a very slightly higher temperature it is viscous, like oil.

THE DIMENSIONS OF ATOMS.—In a recent lecture at the Royal Institution, by Sir William Thomson, on the size of atoms, the speaker, through a series of learned considerations which can not be given here, reached the following conclusions: It is very probable that in an ordinary liquid, or a transparent or semi-opaque solid body, the mean distance between the centers of two contiguous molecules is less than one five-millionth of a centimeter, and more than one billionth of a centimeter. To obtain an idea of the grain and of the corresponding relative sizes, let us imagine a globe of glass or water of the size of a croquet ball (16 centimeters in diameter), and let us increase it in imagination until it becomes as large as the earth, each molecule being increased in the same proportion. Then the structure of this mass thus increased would be more granular than that of a pile of musket balls, but certainly less so than that of a pile of croquet balls.—*La Nature.*

MELTED WOOL.—M. Heddebault has discovered a method of preparing soluble wool from tissues in which wool and cotton are combined. When subjected to a current of superheated steam, under a pressure of five atmospheres, the wool melts and falls to the bottom of the pan, leaving the cotton, linen and other vegetable fibers clean and in a condition suitable for paper making. The melted wool is afterwards evaporated to dryness, when it becomes completely soluble in water, and is called azotine. The increased value of the rags is sufficient to cover the whole cost of the operation, so that the azotine is produced without cost. It contains all its nitrogen in a soluble condition, and can, therefore, be compared to dried blood, which is worth 2.50 francs per kilogramme of nitrogen. M. Ladureau regards this discovery as one of great interest for agriculture and mechanical industry.—*Soc. Industr. du Nord.*

EVOLUTION.—The doctrine of transformation—man descended from the monkey, the monkey from some inferior animal, and this last from some animal still lower in the scale of beings, descending thus to the original polyp—has been considered exclusively a modern doctrine, perhaps thought of originally by Diderot, but of course principally credited to Darwin. However, there is nothing new under the sun, and M. Halevy, of the Academie des Inscriptions et Belles-lettres, has found among the works of an individual named Sanconiathon, who lived, according to the savants, about the fourth century B. C., the following passage, which was reproduced from the original work by Philon of Byblos, and later by Eusebius: "(Then) there was [on the earth] living beings deprived of intelligence, from whom descended beings gifted with intelligenee, who were called Zophasamin, contemplators of heaven."

ZYLONITE.—The newest discovery in plastic materials is zylonite. It is superior in many respects to celluloid, in that it can be formed into flat plates almost transparent, so it can be used instead of glass for stained windows. The discovery of this composition was made about fifteen years ago, although the company at present engaged in its manufacture has been in existence less than two years. The basis of zylonite is white tissue paper, made from cotton or linen rags. It receives a bath of sulphuric and other acids, which produces a chemical change. After the acid is carefully washed out the paper is treated with a mixture of alcohol and camphor. It now assumes an appearance resembling parchment. In this condition it may be worked into plates of any thickness, will receive the most brilliant colors, or may be made perfectly transparent.

POTASSIUM RECOVERY.—Water used in wool washing yields 4.50 per cent of a very dry potassium, which can be recovered, says M. Delattre, at a considerable profit.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

RICH STRIKE.—*Ledger*, Nov. 17: An important strike has been made in the South Spring Hill mine near Amador City. This mine is owned by Boston capitalists, and has been operated for the past four years under the superintendency of John R. Tregloan. In the face of many discouraging prophecies from mining experts he has kept steadily on with his work, not only having faith in the claim himself, but inspiring confidence in the stockholders to such an extent as to lead them to put up the funds to carry on prospecting for four years. During the whole of this time Mr. Tregloan has never seen the color of gold in any rock from the shaft, until the present strike. The shaft has been sunk to a depth of 600 ft. After reaching this depth, a drift was run eastward. Last week when this drift had reached a distance of 60 ft, a fine body of quartz was met with, between the granite and slate formations. The ore is streaked with dark lines, and known as ribbon rock, which is very similar to that in the Keystone mine. It carries a large percentage of sulphurets. Assays of specimens have given over $500 per ton. We were shown on Tuesday samples which would assay much higher than that. The whole face of one piece was covered with specks of fine gold, whilst the reverse side was studded thickly with sulphurets. The ledge has been penetrated 3 ft, without getting through it. The Talisman mill, purchased by the same company, is being fixed up. The ditch has been cleaned out, and if water can be had, the mill will get to crushing next week. It is intended to run through 200 or 300 tons as soon as possible. The prospect is also encouraging for the Talisman mine to start up at an early date.

The *Sentinel* says of the above strike: It is only second to that made at the Nevills mine recently. The ore is of hard ribbon throughout, and gold can be discovered in every portion of the rock, the whole 5 ft across. An assay proved the presence of $514 gold to the ton and some silver. Other rock that has been taken out will go $1,500 to the ton.

NOTES.—*Sentinel*, Nov. 14: The Matson mill at Butte City will start to crushing next week. The mine has a 3-ft ledge of good rock. The Talisman mine of Amador City, which is owned by the same parties as the South Spring Hill, will start up in the spring. All the mills with the exception of the Zeile are now running on water from the canal. They have nearly a full head running in from the river. Spagnoli & Hutchings of Clinton are digging a large ditch three-fourths of a mile long to take water from the south fork of Jackson creek to their placer claim. S. G. Spagnoli is working a quartz claim near Clinton which at a depth of 40 ft has a ledge 10 ft wide. He is having a tunnel run in from an adjoining gulch that when 150 ft in length will tap the ledge at a depth of 200 ft. The work of digging the receiving reservoir for the Plymouth mines is being vigorously pushed. Forty more men went on this week. The reservoir is intended to hold water enough to run 200 inches for 24 hours. The large reservoir in Tyler's ranch is intended to hold sufficient water to run 200 inches for 3 months. A large force of men is employed on Slate creek.

VOLCANO.—*Dispatch*, Nov. 17: The mining interests are looking up since the last rains. The Tunnel Co. are only running part of the time as the scarcity of water will not permit. Gillick & Phillips have struck it very rich in their mine. We have seen the rock which we think will go $100 to the ton. They are going to sink 100 ft on it immediately. Robert Stewart has leased the Tellurium mine and has started to work on it.

DOWNS.—The mill will start up with its full capacity—20 stamps—this week. The ore that has been taken out lately from the old shaft is of splendid quality.

Calaveras.

WEST POINT.—Cor. *Citizen*, Nov. 17: The Scorpion is running a full set of men night and day. The ten-stamp mill now building at the Star of the West will soon be completed. The mine, we believe, will prove to be a bonanza. At a depth of 170 feet the ledge is about 15 inches in width and the ore will yield $30 per ton. The drift north of the shaft extends 90 feet, and the ledge at that point is about 3 feet in width, and quite rich. The Sterling mine is showing well and work is progressing finely. Mr. Sterling will soon start his mill and arastra. Mr. Desmond is pushing work on the Wood House mine. We are told that the Valentine Hill mine will soon be worked.

LAMPHEAR.—The *Chronicle*, Nov. 17th, insists upon the truth of the Mint Director's report upon this mine, in these words: That the mine embraces 1,800 feet in length, of a well defined ledge; that there are two shafts sunk upon it, 160 and 130 feet respectively; that a level 300 feet in length has been run showing a solid, well defined ledge averaging 5 feet in width the entire distance; an excellent 12-stamp mill run very cheaply by water power; with hoisting works and other neeessary machinery; average yield of ore per ton, $7; cost of extracting and milling, $3.50, are all facts that can be substantiated by reliable persons who are ready to certify to the correctness of the statements.

El Dorado.

KELSEY.—Cor. Placerville *Democrat*, Nov. 17: The mining outlook of this place is somewhat brighter. Quite a number of capitalists have been visiting the most prominent mines. Among them Mr. Bibbons, who intends commencing developments on the New York mine by the 1st of next month. The Baltimore mine has suspended operations for a brief period, to resume on a larger scale, after the return of the Supt. The Delmarcia mine and others still continue good.

GARDEN VALLEY.—Georgetown *Gazette*, Nov. 16: We have seen some fine specimens of copper ore this week from the ledge now being prospected in the Halcyon Copper mine, near Garden Valley. The ledge is 6 ft wide, looks well, and ranges all the way from 10 per cent to 60 per cent in copper, besides some silver and gold. The prospectors are much elated.

EUREKA STAMP MILL.—We learn from Mr. Benjamin that work for the new stamp mill on the Eureka is progressing favorably, and that the first load of lumber arrived on the ground to-day.

Inyo.

POTOSI TUNNEL.—*Independent*, Nov. 10: The ledge uncovered in the Potosi tunnel some time ago has now been explored by a cross-cut extending 53 ft from wall to wall and by a drift on the vein 30 ft west on the ledge. In this drift has been found some of the finest ore, the best since the original work was done on the "big cut," of the Ygnacio, near the surface from which was extracted several thousand dollars.

RUSS DISTRICT.—The May Queen mine, in Russ district, above the Brown Monster, and apparently on the same vein, is being worked with good results. Within a short time they have extracted 40 tons of fine galena ore, 10 tons of which are now sacked for shipment. The ledge is 3 ft wide.

CERRO GORDO.—Active work is being done on the Nemesis, St. Paul and Carbonate mines. In the first a large pocket of rich galena ore has been recently struck. They are down about 80 ft on the Carbonate, and have a good vein of quartz rich in gold and silver. This mine is a relocation of an old claim.

INDIANA MINE.—On Saturday, 6 ft north of the old works in the Indiana, Swansea district, a fine ledge of the rich ore for which this mine has been celebrated was uncovered, the samples of which assay from $1,500 to $6,000 per ton in silver.

A NEW STRIKE.—Report comes from Cerro Gordo that a 4 ft ledge of fine silver-bead ore has been opened in the Abalone mine, and in the North Extension of the Union.

Mono.

MAY LUNDY.—Homer *Index*, Nov. 17: No material change to note in the May Lundy since last report, except continued improvement in quantity and quality of ore with every foot of progress in the south drift on the 130-foot level below the lower tunnel. All the stopes are looking well, and are yielding large quantities of high grade ore. One hundred and ten men are now employed in the mine.

GORILLA.—The recent cold nights reduced the flow of water to such an extent that the Gorilla Co. has been compelled to shut down its reduction works, and in consequence the working force in the mine has been greatly reduced.

NOTES.—All the arastras in Mill Creek and Lake Canyon have been closed down on account of accumulating ice. The White Cloud, a short distance from the May Lundy, shows fine development. Pat Ragen is engaged in the development of the Mountain View. A good deal of "assessment work" is being done on claims, and numerous campfires may be seen nightly on the mountain sides, 2,000 and 3,000 feet above the town.

STANDARD CON.—Bodie *Free Press*, Nov. 16: During the week ending Nov. 10th there was shipped to the mills 1,357 tons of ore, and 1,000 ounces of crude bullion received. The upraise from south drift No. 2, 1,000-foot level, has been raised during the past week 11 feet, total height 123 feet. The vein is 5 feet wide and looks well.

BULWER CON.—During the week the north drift, 700-foot level, was advanced 13 feet; total length 440 feet, with nothing new.

Nevada.

IRONCLAD.—*Transcript*, Nov. 15: The revival of work at the Ironclad mine has infused considerable life in Rough and Ready and vicinity. The workings have been pumped dry, and some excellent looking ore is being extracted from the 100 level and also from the bottom of the shaft.

CEMENT.—The two 10 stamp cement mills at You Bet, one of which is being built by the Birdseye Creek Co. and the other by the South Yuba Co., are nearly ready to start up. They will be used in crushing the cemented auriferous gravel.

HOCKING.—*Tidings*, Nov. 16: The contractors who were working on the Hocking ground on Auburn street, had a clean-up on Wednesday of 45 loads of gold quartz, yielding $30 per load. The contractors, Abram & Co., have been working about 8 weeks and made on an average, clear, $4.25 per man per day. The shaft is about 60 ft deep, disclosing a ledge from 6 to 15 inches in thickness.

Placer.

FOREST HILL.—*Herald*, Nov. 17: The Washington Co., a short distance north of Forest Hill, have a considerable force of men at work, and are sinking a shaft in hope of striking the big channel of that divide. They are down over 100 ft, and are preparing to put up improved hoisting machinery. In the vicinity of Forest Hill there is more stir and more life than for some years.

DUTCH FLAT.—A. A. Ferguson says nearly all the miners at the Flat are expecting to do some work this winter, though very few are going to any expense in fitting up in consequence of the uncertainty of being allowed to continue. The slickens agitation, he says, is proving a grand harvest for the Chinamen. Nobody shows any disposition to molest them, and as a result they are either buying or leasing nearly every mine that has anything in it.

ALTA.—Dutch Flat *Times*, Nov. 17: Work in the new shaft on the Alta Mining Co.'s claim is progressing. A depth of 140 ft has been reached. At a depth of from 190 to 220 ft the bedrock is expected to be reached, when drifts will be run in either direction in search of the main channel. Some flattering prospects in the higher gravel have been cleaned up.

Plumas.

ELIZABETHTOWN.—Quincy *National*, Nov. 17: Loring & Leavitt are making arrangements to put a steam pump in their mine. The channel looks better than ever, and the gold is coarse, one piece picked up a few days ago weighing three ounces. It is encouraging to know that the deep channel comes down into the Riverdale claim, and the indications are strong that it will be found all the way through the O'Neill ranch, and in the ranch of Mr. Mills below.

ARCADIAN.—Greenville *Bulletin*, Nov. 14: For some months past the proprietors of the Arcadian mine have been running a tunnel to explore the ledge at a greater depth; the tunnel reached the ledge last week, a drift was started, and an ore body opened up that is much superior to any found in the upper tunnels.

NOTES.—John Ellis turned on the water upon his claim at Providence Hill about a week ago. He is confident he has struck a good thing. Loring and Leavitt have struck good ground and are taking out gold. So far from being worked out, the claim is likely to yield better than ever.

San Bernardino.

RED ROVER.—Calico *Print*, Nov. 17: This mine, under the foremanship of Harry Clay, is developing finely. Harry says he has thirteen tons of first-class ore on the dump, and every thing looking lovely below.

SUE.—Mr. J. B. Osborne has three men at work at the mine and building a road from the Falls to the Mammoth road.

CUBA NO. 1.—Keys & Co. are working steadily and taking out fine ore.

SAM HOUSTON.—Two men are at work on the No. 2 sinking a shaft and taking out ore. This claim is now owned by Wm. Raymond, of the Garfield mine.

PINACARTE.—San Bernardino *Index*, Nov. 10: Mr. T. J. Bryant, who has been prospecting in the vicinity of Pinacarte for weeks past, has been rewarded in finding a ledge of tin ore which is claimed to be an extension of the famous Temescal tin mine ledge. Seven claims have thus far been found and located, and the ore brought to Riverside taken from the surface out-croppings compares favorably with specimens taken from a depth of 160 feet or more in the Temescal mines.

TUJUNGA.—Los Angeles *Herald*, Nov. 10: This is at the head of Tujunga Canyon, 30 miles in a direct line northeast from this city. The ore from this mine has been worked by an arastra during the summer and has yielded at the rate of $60 per ton. With a quartz mill it should have yielded $100 per ton. The ore-bearing ledge is 16 to 22 inches in width, on which are four claims of 1500 ft in length.

San Diego.

MINNIE FEE DISTRICT.—Riverside *Valley Echo*, Nov. 14: We had a trip overland to the new gold fields last Saturday. These mines are in San Diego county 30 miles from this city, and about 6 miles southeast of Pinacarte station on the California Southern railroad, and are in what is known as the "Minnie Fee Mining district." We visited a number of mines, among them the "Nelson," located less than a month ago. The "Nelson" is developed by one incline 5 or 7 ft deep on the ledge. We have several pieces of ore showing free gold.

Shasta.

FLAT CREEK.—*Democrat*, Nov. 14: Weil, Conroy & Murray have decided to erect a quartz mill on the mine at Flat creek. The mill was ordered last week. It is the cannon ball pattern, with a capacity of crushing 5 tons every 24 hours. One of these mills has been running on Tom Green's claim in Deadwood, and has proven satisfactory. Dan O'Neal will also erect one on his claim above Buckeye.

TRINITY CENTER.—Redding *Free Press*, Nov. 10: Mr. Holland intends working the Holland, Rumfelt & Co. mine on Coffee creek this winter, which mine enjoys the reputation of paying regular dividends; this is no "dry gulch" or "winter claim," for it has a full head of water the year round. The Ella May drift mine is idle. Mr. Larson will start the wheel as soon as freezing weather is over.

Sierra.

RAINBOW.—*Tribune*, Nov. 15: At the Rainbow mine, below Alleghany, arrangements are being made to begin work in the upper stopes, and to start the mill. The two Burleigh drills are kept at work driving the lower tunnel. When completed, the tunnel will be 2,300 ft long, and will tap the vein 400 ft below the present workings. It can be authoritatively stated that the crew of Chinamen put to work in the lower tunnel a few weeks ago will be discharged in a few days, and their places filled by white men. The statement made that the Chinamen were armed with rifles by their employers last week was false.

ALASKA MINE.—Several months since, the hoisting works of the Alaska at Pike City were laid in ashes at a loss of $40,000 to the company. It was a glorious thing that previous to the burning of the works the mine had yielded handsome returns. On Tuesday of last week, the new machinery was put in motion, and the work of bailing out the shaft begun. Two tanks, with a capacity of 700 gallons each, are used for bailing purposes. On Friday, the shaft had been emptied of 70 ft of water. When the third level is reached, a steam pump will be put at work.

PLUMBAGO.—The Plumbago quartz mine, at Minnesota, has been bonded to parties in San Francisco. This mine has a good record. An 8 stamp mill was erected a number of years ago, and a tunnel run that tapped the ledge 60 ft below the surface. The ledge was worked on to that depth with handsome profits. Later on, however, in consequence of the lack of funds to prosecute developments, the owners were compelled to close down.

COLUMBO.—The engine and boiler are being placed in position at the Columbo mill this week. Superintendent Deidesheimer is building a residence and will remove his family to the mine as soon as it is completed. A force of men are grading for the tramway from the mill to the tunnel above.

NOTES.—The prospects of the Ruby mine were never brighter than at present. The working force is being added to daily. At the Sierra Buttes mine grading has been commenced, preparatory to building a tramway between tunnels Nos. 8 and 9. The new mill at No. 9 tunnel is nearly covered. Maxon & Van Slyke are pushing ahead work on the Maxon quartz ledge, in Pig Canyon. The gentlemen propose to erect a mill at the mine as soon as praticable. The extension of the Plumbago mine, at Minnesota, is owned by J. Boles. A tunnel is run on the vein and the owner is constantly taking out ore that pays him to crush in an ordinary hand mortar.

Tuolumne.

NOTES.—Sonora *Democrat*, Nov. 17: Work at the Oakland mine, near Columbia, has been suspended, owing to lack of water. The ditch for the Rising Sun mill will be finished in another week. The 25 stamp mill at Quartz mountain has resumed crushing ore from the Heslep mine. The 40 stamp mill of the Alabama mine, at Jamestown, will soon be started up. Gus. Weidekind is taking out about $6 per day to the hand from his gravel claim at Pine Log. The boiler of the Buchanan hoisting works has been repaired, and the works have been started up again. The work of putting up the Huntington quartz crushing mill at the Garibaldi mine is rapidly going ahead. The Knox & Boyle mill (10 stamps), at Quartz mountain, has been shut down owing to scarcity of water. It is the impression that we are on the eve of a mining boom. Old Tuolumne is bound to come to the front.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Nov. 17: Ore of good quality was found in the east cross-cut from the north drift on the 2700 level; also, in the east cross-cut from the south drift. In these cross-cuts, however, the indications of water were so strong as to forbid the pushing of explorations to the east beyond a certain point.

UNION CON.—The station at the 3100 level, joint with the Sierra Nevada, is completed, and are now cutting out on the south side for a donkey pump. In cutting out to the west for the station, quartz of good character was encountered. It carries more silver than the streaks found in the winze. They will now drift north and south from the new 3100 station.

GOULD AND CURRY.—The winze below the 2500 level, joint with Best and Belcher, is in harder material. The peculiar streak of dark and decomposed rock has passed to the eastward. The work of repairing the old Banner shaft is in progress.

BEST AND BELCHER.—The winze below the 2500 level, joint with Gould and Curry, has passed through 15 ft of material containing some iron and other base metals. This formation was quite soft. The bottom of the winze is now in harder material. Not much water is yet encountered.

ALTA.—The partition placed in the main shaft gives a good circulation of air, and the work of putting in new guides and overhauling and repairing the cables is progressing well.

COMBINATION SHAFT.—The new hydraulic pump is probably completed by this time, and as soon as it is properly tested it will be shipped to this city and put in place.

ANDES.—The north drift is in quartz of fine appearance, but of low grade. In the north drift from the winze some ore of low grade is being obtained.

SIERRA NEVADA.—The upraise from the main north drift on the 2900 level is progressing at the rate of 15 ft per week.

YELLOW JACKET.—The usual amount of ore is being extracted and sent to the mills, and this amount can be increased as required. Considerable work in the way of explorations is being done.

CROWN POINT.—About the usual quantity of ore is being extracted and shipped to the mills on the river.

MEXICAN.—The main north drift on the 3100 level is within 10 or 15 ft of the Union Con. As soon as it reaches the line the drift will be taken by the latter company.

BELCHER.—Some ore is being extracted, and the amount will be gradually increased as additional stamps are put in operation in the mills on the Carson river.

UNION SHAFT.—It is still necessary to keep a certain number of men at work at cutting out behind and casing timbers at the 2300 station.

UTAH.—Good progress is making in east cross-cut No. 2 on the 1350 level, which is passing through ground of a favorable character.

CON. VIRGINIA.—The joint California winze on the 2700 level is being sunk and timbered at the rate of 10 ft per week.

IMPERIAL.—The west drift from the 600 station is being pushed as rapidly as possible for the works in the old upper levels.

CALIFORNIA.—The joint Con. Virginia winze on the 2700 level has been sunk and timbered about 10 ft.

OPHIR.—Are still extracting the usual amount of low-grade ore from the old fillings on the 150 level.

OVERMAN.—Some low-grade ore is still being extracted from the old upper levels.

Bernice District.

BOTHWELL MILL.—*Silver State*, Nov. 15: S. R. Young, of Lovelock, informs us that the suit brought against G. W. Bothwell of Bernice has been settled, and Mr. Bothwell has made arrangements with the mine owners to run his mill all winter. Bullion valued at $2,500, from the Botbwell mill, was received at Lovelock on Monday.

Belmont District.

BELMONT MINE.—*Courier*, Nov. 10: The prospects in the Belmont mine are brightening as the work of development advances. It is now believed that Superintendent Fassett has always been on the right track. It is now known that the Company has passed the north-end "horse," and that the mining experts who always claimed there was no more ore south of it were in error. Ore is where you find it, and not where experts would have it.

The following is a copy of the Superintendent's letter of Nov. 10: "No. 1 level in Laity ground is now 206 ft south of Highbridge shaft. Ledge widening and improving in appearance as we go south. Winze No. 1, 55 ft north of face, is down 25 ft and yielding splendid black metal and chlorides. All stopes in south tunnel and in Laity ground are yielding first-class ore, some of which assays up in the hundreds. Mill is doing splendid work; chlorinations averaging 91 per cent. Will commence bullion shipments to-morrow."

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Nov. 10: The cross-cut on the fifth shaft level has been extended 10 ft, being now in a distance of 57 ft, and is showing a small streak of sulphurets in the face which gives assay as high as $225 per ton. The main cross-cut on the fourth shaft level has passed into a very hard slate formation. The progress in running for air connection is slow, the ground being exceedingly hard. A drift is being run on the old twelfth level to ascertain if the ore body found on the levels above extends that far downwards. Every thing in and about the mine is progressing smoothly. The total bullion shipment for the month of October amounted to $33,278.84.

COLUMBUS CON.—The west drift from cross-cut No. 1 remains about the same. The drift to the east from the same point has been extended 5 ft in mineral-bearing ground, some of which gives fair assays. The stope from the 150 level is yielding a considerable amount of high-grade ore. A considerable amount of ore has been taken out since the work of

extraction was resumed. The best of it is being sacked in the mine before it is hoisted to the surface, where it is stored.

MOUNT DIABLO.—The stope near winze No. 1 and below the third level is giving some $50 ore. The stope from lower winze No. 2. is yielding a little ore of fair grade, while that above the west drift on the third level is looking well and giving considerable $60 ore. There was a shipment of bullion amounting to $6,468.43 made on the 3d instant. This was the last shipment on October account, the total amount being $47,108.77.

THE GREAT SUIT.—Reno *Gazette*, Nov. 12: Perhaps no mining suit ever tried in this state has created more general interest than the suit that came up in the United States Circuit at Carson this morning, between the Northern Belle and Holmes mining companies. It involves a matter of $2,000,000 damages, claimed by the Holmes Co. An array of legal talent, the best in this state and California, have been secured, and the most noted experts in the whole country have visited both the mines at various times for the purpose of further enlightening the court, and the jury which will be impaneled. It is estimated that at least $200,000 have already been expended in the preparation of the case.

Eureka District.

ALEXANDRIA.—*Sentinel*, Nov. 15: The Diligent shaft on this mine is now down 250 ft, and will be carried to a further depth of 50 ft, when drifting will be commenced from that point. At present the work of development is slow, but when spring opens it will be pushed ahead rapidly. The new engine from San Francisco is working all right, and every thing about the place goes smoothly. Tributers are exploring the old works, and are pretty successful. One set at work on the Sterling tunnel has now about 12 tons of rich ore on the dump.

MINERAL HILL.—George Rives has started up the Christie mill at Mineral Hill on the Co.'s tailings, of which there are about 30,000 tons in the gulch. Mr. Rives says that he is working the stuff up to 60 per cent. R. D. Clarke will make a test of 50 tons of ore and tailings in the Bertrand mill, and if the experiment proves a success, the mill will be converted into leaching works at once, at a cost of about $15,000.

RICHMOND.—The Richmond mine, says the Eureka *Leader*, was last Saturday partially closed down, a few men only being kept on. The reason for this act on the part of the management is scarcity of ore on the upper levels, and too much water on the lower levels. The machinery will be started up as often as the tributers have ore to hoist.

Humboldt District.

HUMBOLDT QUEEN.—*Silver State*, Nov. 14: T. K. Stewart, who recently returned from a surveying expedition in Humboldt County, says the largest and richest quartz mine in the state is situated a few miles north of the old town of Limerick. He thinks the owners have at least $100,000 worth of ore now on their dump. The ore is gold-bearing, and what is considered unusual for that country, is free-milling and of uniform richness. The mine alluded to is the Humboldt Queen.

Pinto District.

NOTES.—Eureka *Sentinel*, Nov. 13: That portion of the Queen mine leased to Steve Bedell is turning out ore valued at $450 per ton. George Yerrick is preparing to resume work upon the Nahant mine, owned by George Hilkey and himself, and says that he will punch a hole through the mountain as fast as it is possible to do it. John Steel has for the time being, quit work at Newark to lease the Diagonal's tunnel. He will run that property for 2 years. James Berryman, Mark McGath and Richard Berryman, who have a tribute pitch in the Rescue mine, took out 200 sacks of rich ore yesterday from above the old Madden chamber. Bill Long and Hon. J. W. Smith have filled 100 sacks with ore from the old dump of the Silver Stone mine, and will ship the same to the furnaces at Eureka. The tributers to the Champion mine are taking out considerable ore. The vein is smaller than it has been, but the ore is very rich. The Champion is on the same ledge as the Fairplay. The miners of Pinto district are at a loss to know why the White Rose mine lies idle. It is situated directly between the Fairplay and Champion mines, and is on the same lode. It is owned by a Boston company.

Pioche District.

KINGFISHER.—*Record*, Nov. 10: The Kingfisher mine is greatly improving. The shaft is now down 45 ft below the tunnel level, and the ore enhances in value the deeper it gets. The last batch of assays J. C. Lynch had made, the ore being taken from the bottom of the shaft, showed an average of $107.50 in silver.

DRY VALLEY MILL.—The last bar of bullion that will be shipped by the Dry Valley mill arrived in town Wednesday, valued at $1,701. The mill was closed down, owing to the water freezing during the night. There are 50 tons of concentrations yet piled at the mill for shipment.

Tuscarora District.

NAVAJO.—*Times-Review*, Nov. 10: There is ore enough in the upper levels to keep the mill running steadily for a year, by which time the lower levels will be opened and prospected. The opening out of the 650 will develop 200 ft of virgin ground. The vein at the 450, the lowest point at which it has been prospected, is strong and well defined, with no indication of "petering." There is no reason for an inference that it does not continue its downward course or that it will not be encountered in the bottom cross-cut.

THE SIPHON.—*Times-Review*, Nov. 14: The siphon from the North Belle Isle sump to the Navajo is completed, and the water from the former is being drained into the latter, from whence it is raised to the surface by the pumps. The entire flow from these mines will be utilized at the Independent mill, which will start up to-morrow on Navajo ore. Both of the ore houses at the Navajo are full, and hauling to the mill commenced to-day. There is every indication that the ensuing run will be the longest and most successful ever yet made by the Navajo Co.

White Pine District.

SADIE L.—*News*, Nov. 10: Wm. Sheik, who was in from Aurum yesterday, informed us that a strike of great importance has been made in the Sadie L. mine. The ledge, he says, is 10 ft wide, the ore being carbonate and very rich. He is not sure it can be milled and may have to be smelted. This mine is destined to make a name for itself in the near future.

ARIZONA.

CONTENTION.—Tombstone *Epitaph*, Nov. 14: Mr. Thompson informed a reporter yesterday that the pumps would be throwing water by the first of December. Work has been much delayed by the non-arrival of machinery. When in complete running order, the Contention pumps will have a capacity of 700 gallons per minute. This added to that of the Grand Central pumps, about 400 per minute, will give a total of more than a million and a half gallons per day.

GOLD.—Prescott *Miner*, Nov. 8: Two years ago Fermin Mejia found near the old Senator mill, on the upper Hassayampa, 7 pounds of gold quartz ore, from which he extracted $414, calculating the gold at $18 per ounce. He exhibited to our gaze to-day a sample of ore which is fully one-half gold, and will pay at the least calculation $60,000 to $70,000 per ton. This is the finest gold discovery ever made in Arizona, and perhaps in the world. Mr. Mejia is carefully sacking the richest ore, while that worth from $2,000 to $3,000 per ton is left on the dump as second-class.

NOTES.—*Courier*, Nov. 12: Mr. Campbell, of the Oro Belle mine, Tiger district, is getting ready to arastra his gold rock, some of which is worth $1 a pound. Lane's silver mine, between the Tiger and Tip Top, is large and rich. It is tunnelled in a distance of 300 ft. The Peck mine is being worked systematically at a depth of several hundred ft from the surface. The Warrior, Mr. Eaman's mine, is in splendid condition. Eight tons of good ore are every day taken out. Most of this ore yields, when roasted and milled, 113 ounces of silver to the ton. Mr. J. J. Egbert, from Turkey Creek, informs us that there is great activity in that camp. Gallagher & Co. have found high-grade ores in their claim. F. Fulkerson, who is working the National, is in a large body of carbonate and galena ores. John Holmes, working the Homestake and Homesite mines, is taking out very rich ores. Gavin & Co. are working a full force on the Pine Springs.

PIONEER.—*Silver Belt*, Nov. 10: Both Howard & Pioneer mills are shipping their usual quantity of bullion. The South Pioneer shaft is down 400 ft, and they are drifting to reach the ledge, which will be completed in a month. The Pioneer shaft is now down 370 ft, and if they have the quantity of rich ore they are taking out of the winze they will have a bonanza.

SILVER KING.—Pinal *Drill*, Nov. 10: This company has changed superintendent. R. M. Phillips requested the directors to accept his resignation and to appoint Arthur Macy as his successor. Mr. Phillips has accomplished a mighty work during his time. Every department of the business has been reorganized and put in complete order. Rich specimens are more plentiful than ever. They come from the 714 level.

COLORADO.

SURPRISE.—Georgetown *Courier*, Nov. 8: The Surprise lode, on Keith Mountain, has from 1 to 10 inches ore, assaying from 20 ounces to 5,586 ounces silver per ton. The last named assay was made by Robert Neuman this week. The mine is opened by a shaft 70 ft deep, with 8 inches of ore in the bottom.

ONTARIO.—Idaho Springs *News*, Nov. 9: The Ontario Mining Co. paid its 88th dividend on the 15th ult., of 50 cents per share. Total amount of dividends paid, $5,000,000. A tunnel 5 by 7 ft in the clear, and 5,763 ft in length has just been completed, which will drain the mine to a depth of 600 ft.

SILVER PLUME.—Idaho Springs *Gazette*, Nov. 10: Last week John Davidson had a specimen assay on a sample of ore taken out of his prospect on McClellan Mountain, which gave 10,800 ounces of silver and all at grass roots.

IDAHO.

PHILADELPHIA SMELTING WORKS.—Wood River *Times*, Nov. 7: These, Supt. Moulton said, would run 40 days longer, when they would be shut down for the winter. Since the opening, the works have produced 213 car-loads of base bullion averaging 25,000 to 26,000 pounds to the car-load, and carrying an average of 250 ounces silver to the ton. With the remainder of this year's production the total will be increased to 300 car-loads. This will make a total of at least 7,500,000 pounds of bullion, worth in the neighborhood of $1,300,000, produced by the Philadelphia Co.'s works this season.

COLUMBIA AND BEAVER MILL.—The mill has run about 45 days, and during that time has turned out $60,000 worth of bullion. It was a pronounced success from the start. The company guarantee 90 per cent, but Supt. Chase, of the Silver King, upon whose ore the mill was running nearly all the time, says that it did much better than that.

BALTIMORE GROUP.—McGregor & Conner, who a few days ago sold the Allen group of mines, on Warm Spring Creek, to a syndicate of Leadville and Detroit capitalists, yesterday purchased the Baltimore group of 5 claims, situated on Baltimore Hill, 1 mile from the famous Elkhorn mine. The price paid for the property is $30,000.

INDEPENDENCE.—Six men are employed on the Independence mine, east of the Elkhorn. In the breast of the main tunnel, 50 ft in on the ledge, a 10-inch vein of fine dry ore has been struck, containing rich chlorides and sulphurets bearing native silver. The galena vein holds good, about 1 ft in width. The dry ore runs up to 342 ounces, and averages 200 ounces per ton. The Independence and Silver Bullion have both been leased by Popham Bros. to Reid Bros. to July 20, 1884.

BULLION.—Operations at Bullion are assuming winter conditions. Ninety-five men were discharged from the Bullion, and forty-five from the Jay Gould yesterday. It is rumored that forty-five more will be discharged from the remaining mines. This will leave but about one hundred miners in the camp during the winter.

GOLCONDA.—*World*, Nov. 9: There is a large quantity of high-grade ore on the dump, and much more that can be taken out without sinking. The Golconda is situated higher than any other mine in the country, the altitude being 8,000 ft. The ore is free-milling gold ore. The gold is worth $14 per ounce.

BANNER.—A seam struck the other day in the east drift of the Banner mine comes pretty near being the pure stuff. Assays of the ore ran over $21,000.

LEVIATHAN.—Challis *Messenger*, Nov. 6: This is on the mountain south of Bayhorse, and is owned by Wm. J. Scott and Al. Gay. There are three men at work and the outlook is flattering. In the upper or old workings they are working on a vein a foot thick of high-grade copper, and in the lower workings they have a body of the same class of ore one foot and a half thick. In the past two or three weeks there has been taken out and shipped 17,000 lbs. of ore which netted over $600, and there are between 5 and 10 tons of the same class of ore on the dumps.

THOMPSON CREEK.—Jack Kirk and Joe Soucy have purchased a one-third interest in the Davitt, Poor Man and Monday mines, on Thompson Creek, from Godfrey Gagnon for $2,500. These, although mines which were discovered only a few months ago, promise great things. They are large veins of good grade ore, and a number of tons have been shipped to the Bayhorse smelter, which gave good returns.

MONTANA.

MOUNTAIN VIEW.—*Inter-Mountain*, Nov. 10: Work progresses with uninterrupted activity. The face of the 300 ft south level is in ore which is improving in quality as the hanging wall is approached. At a depth of 500 ft the north cross-cut within the past few days, at a point about 20 ft from the shaft, has passed through 3 ft of copper ore.

WASHOE.—In the Washoe the hanging wall has been struck. The ledge is 14 ft wide and all in ore. Drifting on the vein has begun and the extraction of plenty of ore will soon be expected. The 200 north cross-cut is in 70 ft from the shaft, but the north vein has not yet been struck.

ALICE.—Butte *Miner*, Nov. 7: Day before yesterday the contract was let to drift 100 ft on the 800 level, from the bottom of the winze. This company disbursed $41,600 during the past month, the product for the month being $105,836.63 assay value. The amalgamations for the month average 89.55 per cent and the chlorinations 84.02 per cent.

GOLD FLINT.—This property was recently purchased by Wm. A. Clark. Drifting is being done east and west on the east shaft at a depth of 60 ft with good prospects. Fifty tons of ore have just been hauled to the mill. The ore is of high grade.

BELL.—They are driving west on the 400 level to strike the body of ore which was in the 300 ft in the old workings. The 400 ft extends 40 ft to the east and 100 ft to the west. About 20 men are at work.

CLARK'S COLUSA.—The vein has been cut in the cross-cut north from the 100 ft station. They are still sinking the shaft as rapidly as possible with three 8 hour shifts. From the drift from the old discovery shaft during the past week 6 car-loads of first and second class ore were shipped. The first-class ore went 63.9 per cent copper and the second-class 36.8 per cent.

NEPTUNE.—In the drift west from the new west shaft is a fine grade of ore, the vein being about 3 ft wide. This ore runs about 150 ounces in silver and $30 in gold. A large amount is being taken out.

A REPORTER'S NEW EXPERIENCE.—Mr. John L. Thomas, of the Baltimore *American*, was one of the newspaper reporters forming a portion of the Villard party, who visited Butte some time ago. In company with Mr. Hall, the superintendent of the Alice, they visited the 800 level. We quote him: "Mr. Hall with two of my companions left me for a walk to a drift beyond, and I remained with the man in charge of the pump. It was cold and wet and lonesome, and the 'pumpman' had a delightful way of entertaining a stranger that made me feel quite at home. Among other things he told me was that the pump was liable to stop at any minute, and the whole of the lower level be inundated before we could get relief, and that decomposed granite frequently fell in large masses, crushing every thing beneath and that a man had been killed just where I was sitting about 2 days before. No wonder that when Mr. Hall returned I pleaded earnestly to spend the night there. Our opinion is, that miners do not receive half enough pay for the risks they run to life and limb, and, although the pumpman was evidently guying a 'tenderfoot,' yet I am convined the safest spot inside of a mine is outside of it."

NEW MEXICO.

PYRAMID.—Silver City *Enterprise*, Nov. 9: This property, under new management, has taken on new life. There is now piled around the shaft-house of the Viola mine 3,000 tons of stuff, which will have to be assorted to get out the ore, the latter in all probability amounting to more than one-third of the whole. The company has already expended $200,000 upon their property, and expect to put out $50,000 more or prove their property a paying one before that sum is exhausted. In the hands of competent managers, there are no reasons why the mine and mill should not be brought to a paying basis. The ore in the dumps can be assorted to a value of about $80 on an average. Arrangements are complete for supplying the mill, which is a dry-crushing and amalgamating plant, with water sufficient for every purpose.

LAST CHANCE.—Ore shows throughout the levels of the mine, and from the stopes in the 50 and 100 levels there are 18 tons of ore hoisted daily. One-half of this is first-class ore and is shipped to the smelter at Benson, while the rest is piled on the ore dumps. Of this latter there are several thousand tons, which will be milled at some future time. There are immense reserves of low grade standing in the mine. The vein averages 4 ft between walls with ore filling it completely in most places.

STEEPLE ROCK.—Cor. of Silver City *Enterprise*: The camp is in a flourishing condition. Newcomers are arriving every day. All the claims that are being worked are showing up well. Work has been temporarily suspended on the Nugget, on account of the non-arrival of the whim. Grant and Williams are having some work done on the Little Emily. Campbell, Barton and McDonald are doing some work on the Eagle, with fair results. Barton and Johndrews will soon commence work on the Beecher. Cadwell, Brown and Sheehan will do 100 ft more work on the Rain-in-the-face this fall. Livingstone and Stonewall are working the Jersey Lily. They are getting out good ore. George Graven took out some very fine specimens of horn-silver from one of his claims last week.

NOTES.—*Southwest Sentinel*, Nov. 10: The Sherman mine has a splendid showing at present. Nearly 300 tons of good ore have been knocked down recently that will run 40 ounces per ton, and in the main drift the ore is 13 ft or more. The Old Man mine promises to be a veritable bonanza. Another rich pocket has been struck on the eastern side of the mountain that will prove more extensive than the one that yielded $30,000.

BONNIE JEAN.—Charles Fink reports that work on the Bonnie Jean mine at Shakespeare is down 273 ft, and the outlook is favorable. Sixty-five ft of cross-cutting at the 200-level shows up four distinct veins of spurs running in copper, silver and gold to the value of $61 per ton.

KINGSTON.—Deming *Tribune*, Nov. 8: From the Bullion mine, four car-loads a month are shipped to Denver. The last one, for which returns had been received, netted nearly $3,000. This mine has recently yielded some of the richest sulphide and most beautiful native silver specimens ever found in the territory. Some of the former has assayed as high as 90.45 per cent in silver, or more than $29,000 per ton.

OREGON.

TRUE BLUE.—Baker City *Tribune*, Oct. 30: F. M. Bishop, of Salt Lake, after assaying 2 sacks of the True Blue mine—an extension of the Black Maria—says that the Washington district "is a good country to stay with." One sack yielded at the rate of 1,516 ounces silver and 1,020 ounces gold; the other 1,902 ounces silver and 802 ounces in gold per ton.

UTAH.

ONTARIO.—Southern Utah *Times*, Nov. 10: The Ontario Silver Mining Co. paid its 88th dividend, amounting to $75,000, Oct. 31. This makes a total of $5,000,000 paid to date. The Ontario mine shipped for the week ending Oct. 3d, 19 bars of the value of $24,497.11. The total shipments for the year are about $1,500,000.

CARBONATE CAMP.—The hoisting works of the F. M. & S. Co., over the Rattler mine in Carbonate Camp, are finished and in perfect running order. The machinery is of the latest improved pattern, heavy and substantial in construction, and powerful enough to enable the company to sink almost any depth. The ore body in the mine is said to show up splendidly, and promises to prove a low-grade bonanza to its owners. The concentrating works are awaiting for the accumulation of water. Kirby, the manager, has his work so systematized that the daily reduction is made to average 14,000 pounds.

CAVE MINE.—Another valuable strike has been recently made in the Cave mine in Bradshaw district. The discovery consists of another cave, 200 ft long and upwards of 60 ft wide. The ore deposit in the strike is richer than ever. The Cave now ranks second among the ore-producing mines in Southern Utah.

WASHINGTON.

CŒUR D'ALENE.—Cor. of Virginia *Enterprise*, Nov. 14: J. M. Robinson writes from Eagle City: By a glance at any recent map the position of this camp with reference to the Northern Pacific railroad and the well known lakes Cœur d'Alene and Pen d'Oreille can be determined. The camp lies in the very heart of the Cœur d'Alene mountains, about 80 miles east of Fort Cœur d'Alene, and nearly an equal distance south of Lake Pen d'Oreille. Pritchard and Eagle creeks are the 2 streams at the confluence of which is Eagle City. The first named has been the better pospected. Its length from its source in the mountains to where it empties in Eagle is from 20 to 25 miles. It has been prospected, and claims located along it, for 12 miles above its mouth. But few of the claims have as yet been worked by competent miners, though some have proved very rich in course gold. The gold is principally found on and in the bedrock, although in some instances pay has been found in the gravel; and even in the hillside, fully 300 ft above the level of the valley, rich drift diggings have been opened. There prevails among the miners and all who have yet visited this region the opinion that it will soon take prominence among mining camps, and before another winter develop into a very rich camp. Many nuggets have been found weighing from half an ounce to two ounces or more, the largest yet taken out, to my knowledge, being a trifle over 7 ounces in weight. In addition to the rich placer diggings, I may say, in all truth, that this is the richest country for gold-bearing quartz that I have ever yet seen. The winters here are of long duration—having now set in—and snow falls until late in the spring. The average depth of snow is from 7 to 9 ft, and ingress or egress is impracticable except by means of snowshoes until about July 1. Rathdrum, Idaho, is the easiest of access from this camp. It is on the Northern Pacific railroad and the county seat of Kootenai county. I expect to spend the winter in San Francisco, and my address will be there after Nov. 15. Any further information cheerfully furnished.

A DAMPER.—Bodie *Free Press*, Nov. 13: John T. Kelley, a Wood River pioneer who left last June for the Cœur d'Alene fields, writes from that new country as follows: "The country is overrun with excitement, but at least one-half the immigration turns around and may be seen going out within ten days from its arrival. The stories I heard before coming here I have found to be generally magnified about ten times."

AN UNBELIEVER.—Salt Lake *Tribune*, Nov. 14: Frank McCarthy, an oldtime mountaineer, came down from Missoula yesterday, and in being interviewed said: "I think the Northern Pacific Railroad Co. is largely interested in getting up a stampede to the Cœur d'Alene. It is the policy of that Company to fill up the great Northwest rapidly with a population." * * * * "Then you think there is more smoke than fire in this hurrah?" "Decidedly; and railroad smoke at that."

The Butte (Montana) *Inter-Mountain* of the 7th gives Mr. George Odell's report: He does not advise a stampede to Pritchard Gulch this winter, though any man who has money and nothing to do might go there now, and before spring get interests in some good ground. Bedrock has not yet been reached in the gulch, and until it is struck, the future of the gulch can not be determined. Mr. Odell is of the impression that Pritchard Gulch will next spring be the scene of one of the most exciting stampedes ever known.

Cinchona Growing in California.

The best information on cinchona growing in this state emanates from the College of Agriculture at Berkeley, for the horticulturist of the institution, Mr. W. G. Klee, has for several years made the culture a special theme of study and experiment, and the results thereof are contained in the valuable reports made by Prof. Hilgard of the work done in his department. From the last report we compile the following information:

Three species of Cinchona, the Succirubra, Officinalis and Condaminea, growing on the experimental grounds at Berkeley, partially sheltered, received no apparent injury from the frost during the winter of 1881, while the Cinchona calisaya and the hybrid died. In the spring, however, Officinalis and Condaminea were attacked by a peculiar fungoid disease, a little above the ground, spreading in a few days, causing the stem to decay and killing the plants completely. This disease, we have learned, is quite common in the young plantations in India, often making great havoc there.

The only species, therefore, that survived in the open air was the Succirubra, which continued to grow remarkably well through the summer, receiving but three waterings. The early rains and preceding moist but mild weather seemed to agree perfectly with its nature, and it continued to grow all winter, and by the time our first severe frost, that occurred in the beginning of January, 1882, it stood about four feet high, with a handsome crown. The cold, which probably did not go below 26°, killed it to the ground, and although it again has made a start from the root, the shoot is too tender to withstand any frost. Owing to our supply being so very limited, we have not thought it wise to try any more plants in this locality in outdoor culture. The first distribution was made at the end of April, 1881, when the severe frosts of the season were supposed to have passed. Plants were sent to twelve different persons (who previously had applied for them), living in ten different localities, situated in seven distinct counties, as follows: Fruitvale, Alameda County; Martinez, Contra Costa County; Rohnerville, Humbolt County; College City, Colusa County; Nordhoff, Ventura County; Carpinteria, Santa Barbara County; a location near San Gabriel, Los Angeles County; and Santa Rosa Island, in Santa Barbara Bay, besides a few plants scattered over Oakland and Berkeley. The plants were all carefully packed in boxes, and each plant in a pot, nearly all being shipped by express.

In June, 1882, a letter of inquiry was sent to each person having received cinchona trees, submitting the following questions:

Character of soil in which planted? Exposure of location? Condition of trees when received? Condition and size now? Amount of irrigation, if any used, and how late in the season applied? If dead, what was the probable cause? If killed by frost, at what time did it occur? If possible, give the exact temperature at which they succumbed, and also the atmospheric condition at the time, whether moist or dry.

Direct or indirect answers have been received from eight of the persons to whom inquiries were sent, some of whom were very careful and painstaking. It appears from these, that in all but two cases the plants arrived in splendid condition; that the soil selected for them was well drained, ranging from a gravelly, heavy loam to a lighter soil, rich in humus. In all the northern counties, as also in Ventura County, they grew fairly until the occurrence of frosts, when they were killed to the ground (temperature and atmospheric condition not observed), the only exception to this being the locality back of Fruitvale, where one is still living. In the southern counties, also, all but one died. The fact is attributed to various causes; in one case it is given as too hot, while in another, at Carpinteria, the failure of two of the plants is not definitely known to be due to frosts. From this locality, however, we have the report of the only surviving tree of the whole lot; but as it was partially protected, we are still in the dark as to the practical significance of the fact. Unfortunately, the most promising locality, perhaps, Santa Rosa Island, remained actually untried, the plants suffering permanent injury during the voyage from Santa Barbara. Such was also the case with the lot sent to a very sheltered locality in the San Gabriel Valley, Sierra Madre Villa, where the Chirimoya apple is flourishing.

To draw any definite conclusions from these scanty experiments alone seems to be premature; but comparing them with our own observations, and also with the Australian and Indian experiences, as stated in their respective reports, we venture the opinion that these particularly well sheltered locations, subject only to very light frosts, found here and there in the so-called warm belts in a number of counties, may, by careful cultivation and attention, be made to grow the red bark tree (C. succirubra), and the still hardier variety, C. pitayensis (not yet grown here). Whether the cultivation of the tree would repay all the trouble necessarily attending it it is difficult to say, when we consider that the price of quinine no doubtedly must be greatly reduced when the enormous plantations in India, Ceylon and Java, growing in perfectly adapted locations, come into full bearing; nevertheless, it seems a pity that the subject should be dropped altogether without arriving at definite conclusions. We have still on hand a limited stock of plants which could be utilized if the proper appliances for their propagation could be afforded. Without this they will gradually be lost. It must be remembered that our experiments here with the Cinchonas has been of comparatively little expense to the state, having been made in conjunction with other plants, and in the same house, while the seed was a donation. A small appropriation—say of $1,000—would enable us to erect the necessary additional building, and to increase the stock enough to supply such localities as our previous experience has taught us to be favorable.

Cobalt.

Occurrences.

Cobalt in the United States is found associated with the ores of nickel, sometimes with those of copper. At Silver Islet the mineral macfarlanite, found with the silver ores, yields a small percentage of cobalt. In Missouri, at Mine la Motte and at the Saint Joe lead mines, nickel and cobalt-bearing minerals are found associated with the galena, the nickel in the form of millerite, with a small amount of cobalt, and the cobalt as siegenite, in brilliant octahedral crystals. At the Gap mine, in Lancaster County, Pennsylvania, cobalt is found replacing part of the iron in the pyrrbotite; the percentage is exceedingly small, and the ore could not be worked for cobalt alone. Smaltite occurs in Gunnison County, Colorado, at the mines of the Sterling Mining Company, an analysis by Dr. M. W. Iles showing 11.59 per cent of cobalt. Some of the copper ores of Western Nevada are also reported to contain cobalt; and it is found in traces in many of the iron ores of Penusylvania and Virginia. The speiss formed in smelting certain Utah lead ores also contains appreciable quantities of cobalt. Other occurrences of cobalt minerals are cited in the preceding paper on nickel, by Prof. W. P. Blake.

No American ore is worked for cobalt alone, the small amount produced being obtained as a by-product in the reduction of the nickel ores of the Gap mine. These ores are smelted to a matte at the mine, which is further treated at the Camden Nickel Works, and the small amount of cobalt obtained is worked up into oxide. At Mine la Motte the cobalt is obtained in a matte produced in smelting the lead ores, the matte being shipped to England and Germany for reduction.

Domestic Manufactures.

The production of cobalt oxide in the United States is very limited, and, so far as can be learned, no other preparation of the metal is produced. Until recently, all that was used was imported, and now the oxide is only produced incidentally in the reduction of the nickel ores of the Gap mine in Pennsylvania.

Small amounts of the carbonate, chloride and nitrate are produced in this country by chemical manufacturers, the crude material, in the form of oxide, being obtained from abroad. The principal cobalt preparations imported are the oxide, smalt, and zaffre. The last is generally an impure oxide, produced by simply roasting the ore. Smalt is the ground product of a fusion of the oxide (or of zaffre) with quartz sand and potash.

Imports.

It is difficult to get at the exact amount of cobalt preparations imported, as in many cases the weights of packages are not given. The following table gives the number of packages and some of the weights of packages entered at the port of New York in the years 1881 and 1882, and up to May 9, 1883, as published by the *Oil, Paint and Drug Reporter*, of New York City:

If the average weight of the packages for each year be taken, and that weight be assumed the weight of the unweighed packages, the probable amounts imported through the port of New York were as follows:

	1881. Pounds.	1882. Pounds.	1883, to May 9 Pounds.
Cobalt, metallic	9,079	8,103	.....
Cobalt oxide	6,334	7,485	5,540
Smalt	13,224	14,495	13,380
Zaffre	1,887	2,280	633

In the annual report of the Chief of the Bureau of Statistics for the year ending June 30, 1882, the importation of cobalt oxide is stated as follows:

	1881.		1882.	
	Pounds.	Value.	Pounds.	Value.
Cobalt oxide	21,844	$13,837	17,758	$12,764

It is very probable that the amounts of oxide, smalt, and possibly zaffre, are combined in this statement, as the value per pound would be for 1881 63 cents, and for 1882 71 cents, while the quotation of oxide for the year 1882 was $2.65. Smalt is quoted in two grades, the first at 13 cents, the second at 8 cents per pound, and no distinction is made as to grade or class in the reports mentioned. Chemically pure metallic cobalt is quoted in New York at $14 per pound retail. The probabilities are that only a small percentage of the amount given was pure metal, and no figures can be had as to its value.

Production in 1882.

The home production of cobalt oxide, as already stated, is very limited, the production of the Camden works for the year 1882 amounting to 11,653 pounds, valued at a little less than $3 per pound wholesale. The production of the Saint Joe mines has not been ascertained. The value of the nickel and cobalt in the matte from Mine la Motte for the year 1882 was $12,500, but the proportion of cobalt to nickel is not stated.

The uses of cobalt and its compounds are limited. In the metallic form cobalt is used chiefly for experimental purposes. Experiments have been made in England on the substitution of cobalt for nickel in electro-plating, and it is said with some success. The demand for the oxide, smalt and zaffre comes from the glass manufacturers and potters, the oxide and smalt being largely used in the manufacture of blue glass, and more extensively by potters to correct the yellow tint of the ware, as well as in the production of blue ware and in ornamentation. Smalt was formerly used in the manufacture of paper, to neutralize the yellow tint, and in blue ruling, but its extreme hardness proved a serious drawback to its use for that purpose.—*F. W. Taylor, in Mineral Resources of U. S.*

The Cœur d'Alene Placers.

A correspondent writes to the *Oregonian* from Eagle City, I. T., on the 31st ultimo: I send you the latest news from the gold fields. They are beyond doubt the richest diggings discovered in the past twenty years, nuggets being taken out the size of hen eggs, and claims are being jumped every day. Gold quartz leads have been discovered that will astonish the old '49ers. One lead was found last week which is being guarded by armed men both day and night, as every piece of quartz brought to the surface shows the gold plain to the naked eye. A saw mill is needed, as also new stocks of provisions, but the drawback is limited transportation from the post Cœur d'Alene, which is the nearest supply depot. There is only one steamboat plying on the lake, and that belongs to the government. There is work for at least three steamboats. A good opportunity is presented for a store or two in the town of Cœur d'Alene, through which every miner has to pass. The only store is the post trader's, and there is no other store within twelve miles. It is certain that thousands of men will flock to the new El Dorado next spring. Pack trains are flocking in every day. The trail from the wagon road is good. Parties leaving here reach the post in two days. The officers and crew of the government boat are very courteous and obliging, and any body lucky enough to secure passage on the boat will never regret it. Those who are left have to take teams over the Mullan road, and must stop over several times on the route. The first place after leaving the town of Cœur d'Alene is Wolf Lodge, where there are ample supplies for man and beast. The next place is the Mission, where one may have to wait on account of the large crowds arriving there by steamboat. You then strike Mud Prairie, where a store is located. A night's stop is made at Doc. Masterson's, at the foot of the trail, where you get your last square meal, and hay and oats for your horses. I should advise miners to bring along a saddle, as horses can be had, but no saddles. From Masterson's the Indians take you into camp for $6, and your provisions for $4 per 100 pounds.

Boys Learning Trades.

Dr. Frances A. Walker, the efficient and enthusiastic head of the Boston Institute of Technology, is reported to be doing excellent work in the way of inducing many of the boys of that city to become mechanics. The tendency of boys generally in this country, especially during the last twenty-five years, has been in favor of adopting one or the other of what is called the learned professions, and the result already reached is, that with the exception of the clergy the learned professions are all overcrowded, and the law and medicine, which, in the country's earlier days, were broad, straight roads to honor and wealth, are no longer so; indeed, it is only in exceptional cases that they are not the narrowest, crookedest, roughest and longest roads of all to fame or riches. They are filled to overflowing with young men of fair ability, struggling desperately for the bare necessaries of life. But the places which technically educated mechanics should fill are generally empty, for mechanics is not considered a profession, and our boys have preferred failure in a profession to success in the workshop. If Dr. Walker or any other teacher can convince them that mechanics is a certain road to prosperity, and can induce our boys to take to it, he is one of the greatest of public benefactors.

Mechanics is just such a road in this country, which is teeming with all sorts of material to be manufactured. It is the highest technical education that is required for the proper development of this great mass of natural wealth, and the mechanics who have that sort of education will for many years find the way to success an easy one. Such a mechanic need not work with his hands, but with his brains; plan schemes, invent and improve machinery, manufactories, railroads, mines, furnaces and forges, and all that results through labor from them. The learned master-mechanic must long be in America the most needed because the most useful of its citizens. That is inevitable when there is so much mechanical work to be planned and done.—*Philadelphia Inquirer.*

COPPER loses strength rapidly with heat; from zero to 212 degrees it loses about five per cent, while at 550 degrees it looses twenty-five per cent.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

5024. Root of Buckeye, bearing a resemblance to the human form—El Dorado county, Cal. E. W. Hulford.

5025. Silver Ore, breccia coated with embolite—Alhambra mine, Unico mining district, San Bernardino county, Cal. Hon. John Daggett.

5026 Chrysocalla, silicate of copper—Copper World mine, Clark's mining district, San Bernardino county, Cal. Lowry Silver.

5027. Rock with Barite—Copper World mine, Clark's mining district, San Bernardino county, Cal. Lowry Silver.

5028. Copper Ore—Copper World mine, Clark's mining district, San Bernardino county, Cal. Lowry Silver.

5029. Alabaster, gypsum—Colima, Mexico. A beautiful ornamental stone. Williams & Blanchard

5030. Alabaster in which sulphur is imbedded—Colima Mexico. Williams & Blanchard.

5031. Auriferous Quartz—Gold Mountain mine, near Jamestown, Tuolumne county, Cal. L. de'Begon.

5032. Auriferous Quartz—Gold Mountain mine, 400-foot level, near Jamestown, Tuolumne county, Cal. L. de'Begon.

5033. Auriferous Quartz—Gold Mountain mine, 600-foot level, near Jamestown, Tuolumne county, Cal. L de'Begon.

5034. Auriferous Quartz—Gold Mountain mine, 850-foot level, near Jamestown, Tuolumne county, Cal. L. de'Begon.

5035. Wall Rock, footwall—Gold Mountain mine, near Jamestown, Tuolumne county, Cal. L. de'Begon.

5036. Wall Rock, hanging wall—Gold Mountain mine, near Jamestown, Tuolumne county, Cal. L. de'Begon.

5037. Gold Quartz—Hidden Treasure mine, near Murphys, Calaveras county, Cal.

5038. Copper Ore, red ore—Illinois mine, near Luning, Esmeralda county, Nev. J. H. Crossman.

5039. Copper Ore—Jumbo mine; "Jumbo Ore," "Black Oxide"—Sweet Vengeance mine, Santa Fe district, Esmeralda county, Nev. J. H. Crossman.

5040. Copper Ore, Jumbo Ore, Green Carbonate Ore—Sweet Vengeance mine, Santa Fe district, Esmeralda county, Nev. J. H. Crossman.

5041. Limestone, footwall—Illinois mine, near Luning, Esmeralda county, Nev. J. H Crossman.

5042. Wall Rock, hanging wall Illinois mine, near Luning, Esmeralda county, Nev.

5043. Red Jasper—Creek bed, near Windsor, Sonoma county, Cal. George Balser.

5044. Massive Quartz—Douglas county, Ogn. J. W. Cain.

5045. Brown Lignite, 5-foot vein (?)—Temescal mountains, 25 miles southwesterly of Colton, San Bernardino county, Cal. Owned by McIntosh & Chaney. Presented by Wm. H. Mintzer. Fixed carbon, 27.74; combustible matter, 32.26; water, 20.00; ash, 20.00; total, 100.00.

5046. Gypsum, selenite—Silver Peak, Esmeralda county, Nev. W. H. Stanley.

5047. Solid Quartz—Dover mine, Humbug canyon, Placer county, Cal.

5048. Silver Ore—Southern Nevada mine, Bellville, Esmeralda county, Nev.

5049. Silver Ore—Lizzie mine, west drift, Ivanpah, San Bernardino county, Cal. Capt. Battersby.

5050. Dolomite—Inyo county, Cal. W. H. Holt.

5051. Gold Ore—Monticello mine, Sulphur creek, Colusa county, Cal. Wm. Cherry.

5052. Pyrolusite, impure—Three miles from Railroad Flat, Calaveras county, Cal. M. H. Peck.

5053. Ore Containing Free Gold Manzanita mine, Sulphur creek, Colusa county, Cal. Dr. G. B. Hughes.

5054. Ore from the Silver Lead mine, Hornitos, Mariposa county, Cal. A. B. Rowley.

5055. Gold Sulphuret Ore Mountain mine, Nevada City, Nevada county, Cal.

5056. Silver Ore—Golden Crown mine, Prescott district, Bloody canyon, Mono county, Cal. Formerly known as the Antimony mine.

5057. Liquid Asphaltum From a natural well, said to be 100 feet deep, from which it overflows and becomes solid asphaltum—Steel's ranch, San Luis Obispo county, Cal.

5058. Solid Asphaltum from a natural well (see No. 5057)—Steel's ranch, San Luis Obispo county, Cal.

5059. Auriferous Quartz—Idaho mine, Gra s Valley, Nevada county, Cal. Ordinary ore. (See No. 1399.)

5 60. Cement with Gold—Godfrey gravel mine, Grass Valley, Nevada county, Cal. W. C. Stokes.

5061. Silver Ore—Mammoth mine, Lake district, Mono county, Cal.

5062. Silver Ore with Energite Tarshish mine, Monitor district, Alpine county, Cal. Geo. F. Beardsley.

5063. Silver-Gold Ore Valentine mine, Old Coso, Inyo county, Cal.

Mr. Ruskin's Museum.

A correspondent calls attention in a Sheffield paper to the prolonged delay attending the proposed enlargement of Mr. Ruskin's museum, in regard to which eight years have been suffered to pass and nothing done. Mr. Ruskin has himself superintended and had scaffolds erected around the Ducal Palace, Venice, to take casts of the sculpture; also from the cathedrals of Rouen and Amiens, the casts of which are in the storehouse of St. George at Walkley. He keeps two artists constantly employed making drawings from the best continental examples of old masters' work. These drawings, done especially for the museum for the Sheffield people, are dispersed up and down the country. Many are at the Whitelands College, Chelsea, awaiting room at Sheffield. A valuable collection is in the Nottingham Museum, also awaiting a suitable home. The finest collection of ambers, sixty odd pieces in all, are at Mr. Dallinger's College, also hidden out of sight, because there is not room at Walkley to display them. There are coins wrapped up in silver paper, better examples than those in the British Musuem, and lovely specimens of stuffed birds presented by Dr. Hewitson, of Leeds, are still in Leeds, waiting for a home. Most charming patterns for designers and china painters, bought from the famous Eyton collection, for which Mr. Ruskin gave £500, are unused because there is no room to display them, and Mr. Ruskin is waiting to know what the people of Sheffield are going to do before he begins to arrange them systematically. He wrote to say he had "van-loads more of books and things ready to come when there is a suitable home for them," and he had enough material in his home at Brantwoods, in the Lakes, to cover the whole of the Walkley Museum. Yet up to the present time the Sheffield people have only subscribed £45 towards providing a suitable building.

NORTHERN BELLE.—The Holmes-Northern Belle mining suit has commenced at Carson. Holmes claims $2,000,000 for trespass, and the defense claims prior location and the purchase of the ground. There is also a joint issue on the two ledge theory. The Northern Belle contends that it has not worked outside of its own vein; that there is no connection to prove that there is or was any valuable ore body in the ground claimed by the Holmes, and that any ground which plaintiff alleges was trespassed on is the property of the defendant,

Hoisting Apparatus for Wagon Derrick.

Byron Jackson, of this city, manufacturer of agricultural machinery, has attained some distinction as an inventor and designer as well as manufacturer. He has turned his attention mainly to harvesting appliances, and is the inventor of the well known derrick fork so largely used on the Coast. Mr. Jackson and G. W. Bonds have lately patented through the MINING AND SCIENTIFIC PRESS Patent Agency a hoisting apparatus for wagon derricks, a description of which will be of interest.

The hoisting drums are suitably placed on the wagon, and there are two friction wheels, one fixed to each drum, so as to give a greater amount of power than when but one wheel is employed for each drum. A shaft passes loosely through the wheels and drums, so that they may turn upon it, and the ends of this shaft have eccentric journals turned upon them. These journals fit into stationary boxes on the frame, and levers are connected with the shaft so they may be turned around to any desired position in their boxes.

The driving shaft extends across the frame at one side and has friction wheels corresponding with the other friction wheels on the drums. When the eccentric shaft of either of the drums is turned in one direction it will carry the friction wheel forward in contact with the others, so they and the drums will be caused to rotate as long as contact is maintained, and the forks will then be lifted, and when by a reverse movement of the lever the eccentric shaft has been turned in the opposite direction, the friction wheels being no longer in contact, the drums will stop rotating. The forks may be held at any point when elevated, until it is desired to drop their load, by brakes operated by foot levers. Suitable adjusting arrangements are provided to give the same amount of frictional contact to the wheels at opposite ends of the drum.

The friction wheel shaft has a gear on it which engages with a bevel pinion on top of a vertical shaft, which has a horizontal rope pulley secured to its lowest end, at a point so low that the rope passing around it is close to the ground and out of the way of the other mechanism or parts of the wagon.

By reason of the horizontal position of this rope pulley, the driving rope or belt can be brought to it from any direction, and it will not be necessary to set the wagon exactly with reference to the engine or other power, but only so that the feeder belts will be in the best position from the wagon to the thrasher.

The engine being set with reference to the thrasher, so that the main driving belt passes properly from one to the other, the two parts of the rope are carried around the corner-turn idler-pulleys, and are led thence to the driving pulleys on the engine or driving shaft. The idler-pulleys are mounted loosely on a vertical shaft having a plate on the lower end, which rests on the ground. The pulleys are a short distance apart, the upper being smaller than the lower, so if the rope sags between them and the driver the parts will not chafe each other, as they will not be in vertical line. The shaft carrying the idler-pulleys is journaled in a light horizontal frame fixed to a stake or other anchorage. By drawing the pulleys back with a tackle the proper tension is given to the driving ropes. Provision is also made for automatically taking up any slack of the rope due to stretching after the machine is once set.

The Grizzly Quartz Mine.

This old mine, situated near Pike City, in the southwestern corner of Sierra County, is now being reopened by direction of the present owner, Miles I'Anson, of Newark, New Jersey, formerly of Sierra County.

The above-named, it will be remembered, while exploiting the noted Alaska mine (a lode contiguous to the Grizzly) some years since, discovered the rich central pay shoot which yielded such bounteous dividends to the original Alaska Company, and he is sanguine of even better success in the adjoining mine.

The Grizzly was originally located in 1854, by some miners who found surpassingly rich quartz in the croppings, from which several thousand dollars were crushed out by hand-mortar in a few hours. At various times subsequently it has yielded rich specimen quartz, the gold of which was exceedingly massive; but the bulk of the vein is a milling ore of excellent grade, carrying fine, free gold and oxydized sulphurets extremely rich in the precious metal. Astouishing "pan prospects" may be obtained anywhere aloug the walls and decomposed parts in the upper tunnel, where some 500 tons of quartz are cut and ready for stoping out.

A working and drain adit is now being driven from Texas Ravine, which will tap the lode at considerable depth beneath the upper works.

STEEL BELTING is, according to report, now being made in Germany. The belts are made exclusively of steel wire, and are so constructed that they are flexible, easily fastened, and may be tightened at pleasure. The pulley upon which the belting runs must be covered with leather or other suitable material for securing the necessary amount of adhesion. The belting is well adapted for heavy work, it is claimed, and is not affected by dampness or a change of emperature, as is leather.

USEFUL INFORMATION.

How Paper Gas-Pipes are Made.

Paper gaspipes are made by passing an endless strip of hemp paper, the width of which equals the length of the tube, through a bath of melted asphalt, and then rolling it tightly and smoothly on a core, to give the required diameter. When the number of layers thus rolled is sufficient to give the desired thickness, the tube is strongly compressed, the outside sprinkled with fine sand, and the whole cooled in water. When cool the core is drawn out and the inside served with a waterproofing composition. In addition to being absolutely tight and smooth, and much cheaper than iron, these pipes have great strength, for when the sides are scarcely three-fifths of an inch thick they will withstand a pressure of more than fifteen atmospheres. If buried underground, they will not be broken by settlement nor when violently shaken or jarred. The material being a bad conductor of heat, the pipes do not readily freeze.

COMPARATIVE WEALTH OF GREAT BRITAIN AND THE UNITED STATES.—Statisticians have pronounced the United States to be not only potentially but actually richer than the United Kingdom. Counting the houses, furniture, manufactures, railways, shipping, bullion, lands, cattle, crops, investments and roads, it is estimated that there is a grand total in the United States of $49,770,000,000. Great Britain is credited with something less than $40,000,000,000, or nearly $10,000,000,000 less than the United States. The wealth per inhabitant in Great Britain is estimated at $1,160, and in the United States at $995. With regard to the remuneration of labor, assuming the produce of labor to be 100, in Great Britain 56 parts go to the laborer, 21 to capital, and 23 to government. In France 41 parts go to labor, 36 to capital, and 23 to government. In the United States 72 parts go to labor, 23 to capital, and 5 to government.—*Iron.*

PAINT COMPOUND.—A new paint compound has recently been produced. The object is the production of a liquid mixed paint which is cheap to manufacture, will dry fast and with a hard finish, easy to work and not liable to crack or peel, covers a larger surface than lead and oil alone would do, will retain its color, or not turn yellow, as ordinary paint does, when used on the inside of buildings, and will penetrate most surfaces, including wood and iron, and prevent decay. The composition consists, first, in a certain liquid compound for the body of the paint, and secondly, in a body compound for mixture with the other, the two being combined so as to form a liquid mixed paint. The liquid compound has for its ingredients boiled linseed oil mixed with silicate of soda, naphtha mixed with alum, a potash solution formed by dissolving chloride of calcium in water, raw linseed oil, and resin and cod-liver oil mixed with brown Japan.

THE USE OF BISMUTH.—In England the use of bismuth has been patented in a new alloy containing copper, zinc, nickel, tin and bismuth in varying proportions. The so-called bismuth bronze is a hard, tough and sonorous metallic alloy, which is claimed to be especially adapted for the following purposes: For propeller blades, shafts and other appliances exposed to sea water; for telegraph wires, its toughness making it invaluable where much strain has to be endured; for piano and other music wires, on account of its sonorous quality; and for domestic utensils and other articles exposed to atmospheric influence, aluminum being added to the composition when intended for these articles.

SWELLED RIFLE BARRELS.—A Board of Officers, with Capt. Greer as President, has tested a lot of rifles at the Springfield armory to determine the cause of the bulging of the barrel which occasionally occurs in practice. They find it due to the fact that the muzzle has been stopped by sand, caused by resting the muzzle in wet sand, or in dry sand after the gun has become foul from firing. This arrests the passage of the ball, so that the pressure is increased at the point of swelling. It is curious that sand produced this result where wooden plugs, driven in tightly and swelled by steam, failed to do so.

WATER IN TIMBER.—The amount of water present in freshly cut wood is very different as is shown by the following table by Scheubler and Hartig: Hornbeam contains 18.6 per cent of water; willow, 26 per cent; ash, 28.7 per cent; birch, 30.8 per cent; oak, 34.7 per cent; pine, 39.7 per cent; red beech, 39.7 per cent; elm, 44.5 per cent; larch, 48.6 per cent; and white popular, 50.6 per cent. Wood, when dried at 266° F., at which temperature all of the hygroscopic water is expelled, is composed of 50 parts carbon (inclusive of one part of ash) and 50 parts of chemicals.

EARLY HISTORY OF THE AIR PUMP.—If it is difficult to decide who invented the telephone, one of the most recent inventions, how much more difficult it must be to ascertain the date of the discovery of the air pump more than two centuries ago. Gerlandt contributes a paper on this subject to Wiedermann's *Annalen*, in which he says that only this much can be established with certainty in regard to the date of its discovery, namely, that it was prior to the middle of August, 1652. Boyle invented the transparent receiver with movable cover; Huyghens, the air pump plate; Huyghens and Papin, the barometer test (manometer for low pressure); Papin, the doubly perforated cock, the use of two barrels, and the valves; but the latter were used by Sturm.

A HOME-MADE FOUNTAIN PEN.—Take two ordinary steel pens of the same pattern and insert them in the common holder. The inner pen will be the writing pen. Between this and the outer pen will be held a supply of ink, when they are once dipped into the inkstand, that will last to write several pages of manuscript. It is not necessary that the points of the two pens should be very near together, but if the flow of ink is not rapid enough the points may be brought nearer by a bit of thread or a minute rubber band.

MACHINERY VS. HAND LABOR.—The *American Machinist* says that a machine firm in Philadelphia was recently asked to construct a small machine which had just been invented. It did the work in good shape, but necessarily by hand labor, and found the cost nearly $200. It then undertook to manufacture the machine for $10 each by the use of especially constructed machinery, when an order for $1,000 was given. This is an example of the reduction of first cost by systematic manufacturing processes.

WIRE-DRAWING.—It was not until some time after 1300 that wire-drawing became an art. A race of wire-drawers, who made iron wires by hand and afterward by water power, then sprang up in Germany, and became famous in Europe. Wire-making was introduced in England about the middle of the fifteenth century. This industry was commenced in the United States at the beginning of the present century, and it is needless to say that it has grown into enormous proportions within the past few years.

HOW TO make a rat-tail file that will cut faster and last much longer than any cut-file ever made: Draw out a piece of steel to the size you want the file to be. Make it square and tapering to a point at one end; then twist it like any auger, but closer; heat it to a dull red, and chill it in water, dipping it straight down. Draw but little temper. You will be surprised to find how fast it will cut and how long it will last. The *Blacksmith and Wheelwright* is authority for the above.

AMERICAN IRON BRIDGES.—The Mexican Central officials complain of the iron bridges made for the road in England, and seem determined to have all future orders executed in the United States. The American bridges are lighter, while as strong, and of superior construction. What tells against English bridges are the exasperating delays. In America orders are filled promptly.

UNSAFE LUBRICATING OILS.—According to a writer in a contemporary, animal oils are unsafe to use in air compressors, as they take fire spontaneously in compressed air, or, in other words, they create an explosive gas.

GOOD HEALTH.

Change of Location for Health.

Change of location for invalids, says the *Journal of Health*, is an important curative element of itself, without reference to change of climate. As a rule, persons who have contracted diseases while residing near the sea receive the most marked benefit by changing their residence to a location "inland," and beyond the influence of the salt air; on the contrary, people who reside inland, when health fails, are benefited by changing their residence to some point near the sea. This is most marked in diseases of the throat, and in less degree in diseases of the chest; but then in almost all diseases benefit is derived from a change of location, whether it be a point more or one less salubrious than the place of departure. Now, we believe that climate changes have, ordinarily, very little to do with it, and that the improved condition is almost wholly due to pleasurable emotions excited in the mind by the new scenes and incidents which interest it and keep it occupied. This fact is an illustration of the power of the mind over the body. We see this power displayed in every act of our lives. What is called "moral force" is supreme; properly directed it would eliminate more than half the ills of life; but let the mind become chained to an idea, and all the skill of medical men is often powerless against it. Let a patient be thoroughly convinced that he is the victim of a fatal disease, and if in due time he is not convinced to the contrary, be may bring the disease upon himself or die from fears that—too late—have proved groundless. We would not discourage the use of medicines where their employment is plainly indicated, but there are thousands who are suffering from ailments that can not well be defined, and which affect both mind and body. The remedy is change. Go! no matter where. Do! no matter what, so long as it is worthy. In our opinion, the great mass of semi-invalids simply need a thorough shaking up. Give the immortal mind something better and nobler to do than to be constantly occupied with troubles that are imaginary.

Home the Best Place for Invalids.

The N. Y. *Sun* compiles from the *Continent* the views of a physician about the curative powers of nature, in which opinions are expressed somewhat different from the above. The physician concludes that it is better for a consumptive to stay at home, where he can be comfortable, than subject himself to the discomfort of hotel life, or to the greater inconvenience of a camp. He says that the camp cure may be fairly tried by sleeping on one's own house-top. Another medical man replies that the summer conditions of spruce forests are eminently favorable, and consumptives have recovered in the most surprising way living under canvas in them, where the air is impregnated with the healing emanations peculiar to the non-deciduous tree growths. There are consumptives whose lungs crave the salt air of the ocean; others to whom the dry atmosphere of Colorado is infinitely soothing; and others again who are benefited by the climate of Florida or Southern California. "To prescribe Florida for one person might mean death, while if he went among the northern paradise of spruce, recovery might follow."

DEATH FROM PASSION.—Cases in which death results from the physical excitement consequent on mental passion are, according to the *Lancet*, not uncommon. A recent instance has again called attention to the matter. Unfortunately, those persons who are prone to sudden and overwhelming outbursts of ill-temper do not, as a rule, recognize their propensity or realize the perils to which it exposes them; while the stupid idea that such deaths as occur in passion, and which are directly caused by it, ought to be ascribed to "the visitation of God," tends to divert attention from the common-sense lesson which such deaths should teach. It is most unwise to allow the mind to excite the brain and body to such extent as to endanger life itself. We do not sufficiently appreciate the need and value of mental discipline as a corrective of bad habits and a preventive of disturbances by which happiness and life itself are too often jeopardized.

THE WATER CRESS.—Dr. Grelletz, of Vichy, brought before the Therapeutical Society (*Bulletin*, June 30), the question whether this popular article of diet possesses any of the depurative qualities popularly attributed to it. He is of opinion that it does not, and that it is indigestible to most stomachs. It has acquired an undeserved reputation, and may be mischievous in the various forms of dyspepsia. He recommends its being prepared for the table in the same way as spinach, when it is easily digested and of a pleasant taste, or the cress may be carefully washed, cut up into small pieces, and then submitted to a press in order that its juice may be expressed. This is a little acrid, but may be corrected by syrup of bitter oranges or of horseradish, when it is beneficial in cases of diabetes.

THE RELIEF OF TOOTHACHE.—The following is a formula recommended by Professor Babaieff to the Caucasian Medical Society, and indorsed by Kenneth W. Milliean, of Kineton, in the *British Medical Journal:* Melt white wax or spermaceti, 2 parts, and when melted, add carbolic acid crystals, 1 part, and chloral hydrate crystals, 2 parts; stir well till dissolved. While still liquid, immerse thin layers of carbolized absorbent cotton wool, and allow them to dry. When required for use, a small piece may be snipped off, and slightly warmed, when it can be inserted into the hollow tooth, where it will solidify. The ease produced by this simple method is really very great.

BISULPHIDE OF CARBON A CAUSE OF INSANITY. California physicians who have attended various cases of trouble arising from the poisonous properties of bisulphide of carbon, have become satisfied that the inhalation of the vapor of this substance will produce insanity. The bisulphide is used in Los Angeles County to prevent the spread of the grape disease, phylloxera. Several strong and healthy men who have been exposed to the fumes of the vile stuff have become insane. It may be a subject worthy of investigation whether other deleterious gases may not in like manner affect the human brain.

EFFECT OF PECULIAR PERSPIRATION.—An exchange mentions as a curious instance of the slight causes which promote oxidation, the experience of a manufacturer of fine cutlery, who found at one time a large portion of his goods being returned to him as in damaged condition. Instead of bright, clean surfaces, he found rusty, deeply oxidized blades. After much watching to determine the cause, it was located upon the man who sorted and wrapped the knives in packages. Every thing be touched was found to rust from the peculiar acid character of his skin exhalations.

APPLES AS FOOD.—In a bushel of ripe Hubbardston Nonsuch there is about six pounds of soluble nutritive material, in Tolman's Sweet about seven pounds, and in Baldwin about five pounds, and this material will vary to a considerable extent in value. These results agree with practical experience in feeding apples to animals. When eaten in connection with farinaceous food they serve to maintain health and improve the appetite,

TABLE OF CONTENTS.

EDITORIALS.—The Clayton Improved Air Compressor, 329. Passing Events; Troubles of an Inventor; Oakland's Telescopes; The Salt Lake Mining Institute; The Manufacturers' Association, 336. Collecting Flue Dust; Electro-Magnetic Ore Separator; Academy of Sciences, 337. Foundry Notes, 340.

ILLUSTRATIONS—The Clayton Air Compressor, 329. Ground Plan Showing Arrangement of Smelting Works and Flues; Profile of Flue from Starting Point of Chimney, 337.

CORRESPONDENCE.—Recollections of California Mining Life; A Simple Rain Gauge, 330.

MECHANICAL PROGRESS.—Cast Iron of 47,500 Pounds Square Inch Tensile Strength; Engine Details; Lead-Lined Journal Boxes; Testing the Physical Changes of Metals; A New Use for Birch Bark; Water Jacket for Iron Furnace; Preserving Wood, 331.

SCIENTIFIC PROGRESS.—New Metallurgical Discovery; Motion of Glaciers; Ocean Formations; Distillation in Vacuum; Liquid Oxygen and Nitrogen; The Dimensions of Atoms; Melted Wool; Evolution; Zylonite; Potassum Recovery, 331.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 332-33

USEFUL INFORMATION.—How Paper Gas-Pipes are Made; Comparative Wealth of Great Britain and the United States; Paint Compound; The Use of Bismuth; Swelled Rifle Barrels; Water in Timber; Early History of the Air Pump; A Home-Made Fountain Pen; Machinery vs. Hand Labor; Wire Drawing; American Iron Bridges; Unsafe Lubricating Oils, 335.

GOOD HEALTH.—Change of Location for Health; Death from Passon; The Water Cress; The Relief of Toothache; Bisulphide of Carbon a Cause of Insanity; Effect of Peculiar Perspiration; Apples as Food, 335.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 340.

MISCELLANEOUS.—Astronomical Notes; Alum; Gold Saving, 330. Cinchona Growing in California; Cobalt; The Cœur d'Alene Placers; Boys Learning Trades; Recent Contributions to the California State Mining Bureau; Mr. Ruskin's Museum, 334. Hoisting Apparatus for Wagon Derrick; The Grizzly Quartz Mine, 335.

Passing Events.

Next week our annual Thanksgiving occurs, and the proclamation having been issued the good housewives are even now preparing for the usual extra dinner. The fare in the miners' cabin will change, too, from the regular pork and beans to something better, it is to be hoped, for indulgence in the good things of life makes a beneficial change for all of us.

Though we read of snow and ice in the mountainous region, the weather in these latitudes is sunny and pleasant, the fogs of last week having been dissipated.

Aside from what our summary notes there is little new in mining affairs. Utah seems to be prospering rather more than her neighbors, and is attracting more than the usual share of attention. This is due to her bullion shipments, no doubt. The bullion shipments, regularly made, speak louder than any thing else in favor of her mines.

We devote more space this week to our mining summary than usual, and change some of the tables to other pages, an improvement our readers will no doubt all notice.

THE Cœur d'Alene placers are about far enough away and sufficiently difficult of access to cause a big stampede next spring among miners who think there's millions in it. The ground will be covered with snow from now till June, but this will not dampen the ardor of the stampeders in the least.

Troubles of an Inventor.

When a man makes an invention, naturally the first thing that occurs to him is that he must make something out of it; but before he can do this, it becomes necessary for him to properly secure his rights to himself and patent his idea. The question then is how to go about this. He knows that the government will allow him a patent if he applies for it, but he does not know how to do this. He scarcely knows in whom to confide, even, in asking for advice on the subject. He finds that the mere inventing is not all there is, but that apparent troubles begin to beset him as soon as he has invented.

It is then found necessary to secure the services of a patent agent who is familiar with the forms and requirements of the Patent Office, and who is capable of writing a clear and comprehensive description of the invention, in order that the authorities at Washington may understand it.

But our inventor is again in trouble. He does not know which one of the numerous agencies he sees advertised is the best for him to choose. He finds that some seem willing to do his business for the fun of doing it, apparently, or for the good of human nature, judging by the inducements they hold out; but when he comes to consider a moment, he remembers that honest people can hardly afford to carry on business for others without some compensation. So that class of agents he hardly cares to trust. Then another advertisement shows him that there are certain men who will do all the work of preparing his papers and drawings, and attending to the case for him, and not ask for any pay unless they get the patent. This seems somewhat strange to him, as he knows that few men care to take the risk of other peoples' ventures on their shoulders without compensation, and he knows that people who take large risks expect large profits; therefore he is somewhat shy of this class of agents, albeit their offer seems very reasonable on the surface. Next, his attention is attracted by the alluring advertisement of a bureau or something of that kind, the object of which is apparently to do all manner of good to inventors because they are inventors, and which will not only obtain his patent for him but sell it after it is obtained. This strikes him at first as a very good scheme, and he makes up his mind to try this kind of a concern, but a friend with experience suggests a few queries in connection with the subject.

In the first place he calls attention to the fact that the old-established and responsible patent agencies, which have been attending to the interests of inventors for years, do not consider it proper to carry on the business of selling patent rights in connection with the other business. It is only ephemeral or catch penny establishments which branch out in this manner. There is no record of a long established agency of the kind. The two branches are perfectly separate classes of the business. The talent required to procure patents is of an entirely different kind from that necessary to sell them. Moreover, the two branches conflict. If an institution has two or three amalgamators or incubators for sale, it is not exactly the place an inventor of an amalgamator or incubator would choose with which to intrust his patent application. These and other reasons have weight with a careful man seeking the best person to attend to his business. He finds on inquiry that this class of people invariably want some kind of fee for exhibition of model, or as guarantee, or something of the kind, and that the pretended philanthropy for inventors is expected to bear some fruit, and that immediately.

Our inventor comes to the conclusion, after all, that to have his business properly attended to, with intelligence, experience and honesty, he must employ some agency long enough in the business to have established for itself a reputation for reliability. He expects to pay for their services, and finds, when he inquires, that their uniform charges amount to even less than those imposed, on one pretense or another, by inferior concerns. He finds, too, that there are no extra charges for things supposed to have been paid for in the regular fee, and that having once taken hold of the case, the reliable agency intends putting it through as originally promised, even if the case has to be amended to suit the wishes of the class-examiner several times. And if he continues and obtains his patent, it will be found that the document is worth something more than the mere paper it is written on, and has been so drawn as to stand the tests of the courts in case of necessity. It pays to do business in the proper way and with good firms, in all our transactions, but in none more so than in patents.

Oakland's Telescopes.

Within the past month no less than three large telescopes have been received in Oakland—an 8-inch refractor, by Alvan Clark & Sons, for the Schabor Observatory; and two silvered-glass reflecting telescopes, by John A. Brashear, of Pittsburgh, for private gentlemen—one of 8½ inches clear aperture for D. J. H. Wythe, and one of 10½ inches clear aperture for Mr. Charles Burckhalter. The one owned by Doctor Wythe will be mounted equatorially, and he is now constructing a small observatory to receive it. The larger one is complete and in operation in the neat little observatory of Mr. Burckhalter, at 962 Chester street.

This class of telescopes is comparatively of recent invention. Dr. Henry Draper, at Hastings on the Hudson, about 10 years ago made the first instrument of this description in America. These new reflecting telescopes possess many advantages, among which may be mentioned that they are entirely free from chromatic aberration, they are only half the length of achromatics of the same aperture; their dividing power on close double stars can not be surpassed, as they give smaller star disks than refractors; and for lunar and planetary detail they are very superior. Mounted as Newtonians, every part of the heavens may be observed with ease and comfort.

The power of these instruments as compared with achromatics is given by John Browning, of Loudon, who is a clever optician and the maker of both refractors and reflectors, as one-sixth less in light-grasping powers, while in their dividing power—that is, their power of separating double stars—they are fully equal to the finest achromatics of the same aperture; while the Rev. T. W. Webb, the author of that invaluable little book "Celestial Objects for Common Telescopes," assigns equal light to Newtonian reflectors of 9, 6½ and 4½ inches, and achromatics of 8, 5¾ and 4 inches respectively.

Mr. Burckhalter's instrument is mounted as an equatorial in the Newtonian form, with declination circle reading to one minute of arc, while the time circle reads to four secouds of time. It is provided with a slow motion in declination, and also in right ascension, by which, when the object is brought in the field of view, it may be followed with very little trouble, by means of an endless-screw motion, imparted by a handle brought to a convenient position for the hand of the observer. The eye-pieces range in power from 90 to 648 diameters, which is all a telescope of even larger aperture would bear at the low altitude of Oakland. The mounting is extremely rigid, weighing about 800 pounds, but the telescope moves with the greatest ease.

There has been very little good observing weather since the instrument has been placed in position, but the tests so far given show it to be a very superior telescope, and its performance has greatly exceeded the owner's expectations. During a few hours when the atmospheric conditions were favorable the planet Saturn was observed, the numerous belts on the globe, the dusky or crape ring, and the division between the rings, were easily seen, while six satellites and the division in the outer ring were plainly visible. The snow-caps of Mars were remarkably plain, and the markings of the seas and continents which intersect his ruddy globe were distinctly made out. The planet Jupiter, with his varied colored belts, was a splendid object; but the Great Nebula in Orion—that wondrous cloud of light, and one of the most remarkable objects in the heavens—was by far the grandest sight of all. Studded with stars, the dark rifts, and clouds, and sprays of fiery mists, the chaotic material of future suns, as seen with so large a telescope, form a grand and imposing picture. Mr. Brashear's specula have already gained an enviable reputation, and these are but the pioneers on this Coast of many silvered-glass reflecting telescopes.

THE output of bullion in Utah this year will be about $1,000,000 more than for 1882. A large number of mines have been working, and the outlook for the coming year is more encouraging than ever before.

The Salt Lake Mining Institute.

Some time since we made mention of the proposed organization of a Mining Institute at Salt Lake City, Utah. The object is to maintain a museum of the ores and minerals, and to collect, classify and preserve all information obtainable respecting the mines and mineral resources of Utah, primarily, and secondarily of adjoining states and territories; to procure and keep on hand or on file geological and mineralogical books, reports, maps, papers, maps of mining districts, and of the underground working of mines; plans, specifications and process of different smelters, mills, pumps, roasters, hoisting and other machinery employed in mining, and the reduction of ores; to publish and distribute annual or monthly reports on the condition and output, growth, development and prospects of the mining industry, and of business connected therewith; and to do all such things as are necessary to the well-being and prosperity of the mining industry of Utah and adjacent regions.

This looks like rather an extended programme, but only partly carried out; a very good institution ought to be evolved from it. It is evident that something similar to the California State Mining Bureau is contemplated, with this difference, however: The Utah Institute is supported by private subscription, while our Bureau is maintained by the direct tax and state aid.

Subscribers to the support of the Institute, at the rate of $12 per year, payable yearly, semi-yearly or quarterly, are entitled to all the privileges of the Institute, to the right to introduce visitors, and to place on exhibition in the rooms samples of the products of their mines, with plans, maps, and written or printed descriptions of their mining property, under the regulations of the executive committee. The payment of $100, or of the yearly subscription for ten years, entitles one to a life membership.

The advantages to miners of founding and maintaining an institution of this kind are many. It is only to be regretted that similar ones had not been established in many other localities years ago. There would now be collected a mass of information of great value to the whole community. In the California State Mining Bureau, which has been in operation only some four years, a great deal of good has been done; a large number of specimens of various kinds have been collected, and more or less information has been compiled and published. Organizations like the Bureau or Institute would do a great deal of good at other mining centers.

The Manufacturers' Association.

A permanent organization of the Manufacturers' Association has been perfected, an election of officers having been held with the following result: President, A. S. Hallidie; Vice-President, Irving M. Scott; and Treasurer, N. W. Spaulding. The Chair then appointed J. H. Gilmore Secretary. Colonel Harney then offered the following:

Resolved, That an Executive Committee of three, to which the President shall be added, shall be appointed, whose duties shall be to examine into the affairs of the Association, to prepare a circular which will embody the principles of this Association, and send same to all manufacturers in this state, and invite membership therein, and also to report to the Board any and all matters that may be necessary for the welfare of the Association, from time to time.

Colonel Harney then addressed a request to the Chair that he might be excused from serving on the committee. The Chair granted the request and appointed Messrs. Garratt, Phelps and Haraszthy. A Finance Committee, consisting of Messrs. Hecht, Harney and Kerr, was also appointed. The Secretary was authorized to solicit subscriptions, and it was decided that the Board should meet on the first Monday of each month, at 3:30 P. M. The place of meeting was referred to the Executive Committee, with instructions to notify the Secretary of its location, and the meeting then adjourned.

A SPECIAL from Milwaukee says: The striking miners at Iron Mountain, Michigan, although confronted by eighty special deputies from Chicago and Milwaukee, induced the engineers and pump miners to leave their mines, and within one day the mines will be completely flooded. The strikers have been informed that they will be paid to date and discharged for the winter.

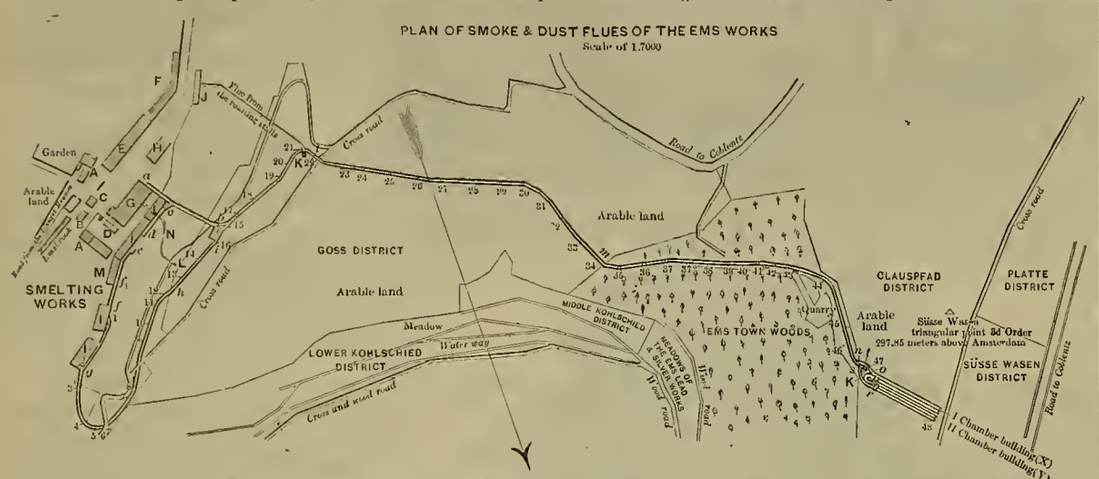
Collecting Flue Dust.

The importance of condensing the gases which escape from furnaces so as to save the fine particles of ore carried off mechanically and those that are volatilized, has for a long time occupied the attention of metallurgists everywhere. Dr. T. Egleston, of New York, recently visited the lead and silver works at Ems, near Coblentz, on the Rhine, and through the politeness of Mr. Frendenberg, General Director of the works, was enabled to study in detail the methods of condensation and receive from him the important results which have been obtained through a series of experiments lasting over a number of years. The results of these observations Dr. Egleston has embodied in a paper which he read before the American Institute of Mining Engineers, from which we condense the facts presented in this and the following numbers of the PRESS.

All the experiments that have been made in the direction of saving the materials carried off by the gas may be comprised in two categories, —those in which attempts have been made to collect the dust by means of water, and those in which water has not been used. The condensation of gases by means of water is at best a very rude method. Experience has shown that both solid and gaseous products, even when not under the influence of pressure or of high velocities, may traverse considerable depths of water without change and with almost no condensation. Water condensation has been used in this country to some extent, but its results have always been unsatisfactory, both because the material which is so condensed is very difficult to treat, being collected as a liquid mud, which when dry is in the form of an impalpable powder, and because the water supply in most of the places where the works are situated is very limited; so that at the present time most of the serious experiments that are being made are conducted altogether without water. It becomes at once a matter of the first importance in these experiments to know whether great length or great volume of flue within a given extent, or great surface in a limited volume, is better for this purpose of condensing the gases. The experiments made at Ems are quite conclusive in regard to this question, and show that great surface is the most indispensable requisite.

The question of choice between very long flues and very wide chambers seems to be settled definitely, as we shall see by the experiments made in the works at Ems, the conclusion being general that a maximum of surface, without special reference to volume or length, is what is required, and this maximum of surface can be better gained, so far as the condensation is concerned, and also more economically arrived at as to cost, by the arrangement which is there used.

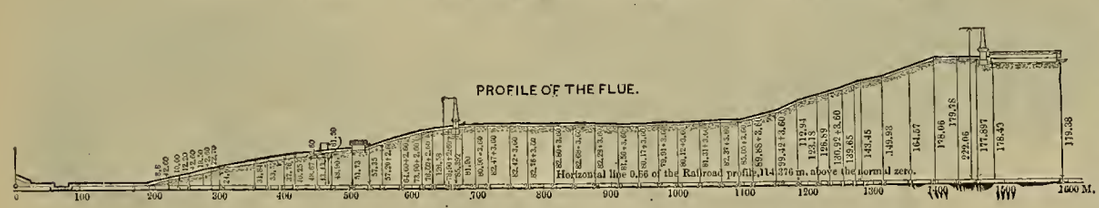
The experiments made for condensing the materials contained in the gases were commenced in a systematic way in the year 1874, when, with the object of obtaining volume, both systems, that of short, wide chambers, and that of long, narrow flues, were constructed, in order to ascertain what should be the principle adopted in the future construction of the works. In order to understand the experiments thoroughly, a ground plan of the smelting works, and of the flues, and a profile of the flue from its point of starting in the works to where it finally terminates in the chimney which discharges the gases into the air, are given herewith.



The Ems Lead and Silver Works are composed of two separate establishments. The one which is nearest to the famous watering-place is the mechanical preparation or ore-dressing works, which is one of the largest, the most complete, and also one of the best known in Europe, but with which we have nothing to do in this article. The mines, the smelting works, and a small part of the mechanical preparation works are situated about four miles distant, in a valley running at right angles to the valley of the Lahn, through which a small stream runs. The mine and part of the crushing and selecting works are situated on the eastern side of this stream; the smelting works are situated on the west bank of the same stream. These latter consist of a series of buildings containing the furnaces and storehouses, built upon a plateau several meters above the stream, at the foot of a high hill which, next the works, is very steep, but which, after passing Station 22 (see engraving), rises more gently. Leading away from the works up the hill are a series of flues of various sizes, the first part of which runs along an old road up to the first chimney at Station 22, and from there goes directly over the hill to the highest chimney at Station 47. The U-shaped part of the flue, *c*, *d*, *e*, *f*, *g*, *h*, on which the shaft and roasting furnaces are situated, is joined to the furnaces by means of short flues. The plan shows the position and arrangement of all these buildings and flues. The construction details of the flues at different points will be given later.

The main flue is 1,700 meters in length; counting all its branches, its total length is 2,271.48 meters. The greatest section of the flue is 4.512 square meters. Its total wall surface is 18.060 square meters. Its highest point at Station 47 is 178 meters above the floor of the furnaces. At this highest point it enters a chimney whose section at the bottom is 2.47 meters and at the top 1.80 meters, and whose height is 45 meters, its top being 223 meters above the furnaces. The ventilating flue N, and its chimney L, which were formerly used for ventilating the shaft and cupel furnace house G, and the flue from the roasting stalls, which ends in the chimney at Station 22, have no connection with the main flue. The short and steep flue *a b*, with its arm *c d*, connects the shaft and cupel furnace house, and also some of the roasting furnaces, with the condensing chamber at Station 16. The gases enter on the southerly side, in the compartment .. These gases move towards the northerly side; those in compartment II towards the southerly side. The flue *e f*, *f g*, *h i*, *K*, connects the other roasting furnaces with the main flue also at Station 16, but follows around an old road going gradually and with an irregular curve up the hill, and empties its gases into the compartment III of the condensing chamber at *i*, Station 16. The gases enter on the northerly side in the compartment III, join those in compartment II, and enter the main flue at Station 15.

Electro-Magnetic Ore Separator.



A man named C. G. Buchanan, of Brooklyn, New York, has recently devised a new form of machine to separate the iron in ores or magnetic sands from the gangue or other non-magnetic substances. The machine consists essentially of two revolving rolls, fixed parallel with and a short distance apart from each other, and charged or magnetized by permanent or electro-magnets, in such a manner that a strong magnetic field is formed between them, their outer faces becoming, at the same time, less magnetic, so that as the ore or sand is fed into the magnetic field of the separator the magnetic particles of ore or sand are attracted to the rolls, and carried by the revolutions of the latter around to opposite points where the rolls lose their magnetic force, at which points the magnetic portions of the ore fall by their own gravity from the rolls, while the gangue or non-magnetic portion of the ore falls directly through the magnetic field between the rolls, by which the separation of the iron from the gangue is effected. The rolls are so constructed that, when charged, the magnetic field formed between them is of equal strength throughout their length.

There are several methods within the scope of the invention by which the rolls may be magnetized or charged with magnetism. It is not absolutely necessary that the rolls should be charged from both poles of a battery or dynamo machine, though by that method a better effect can be produced. A number of separators may be charged from one dynamo machine or battery by connecting with only one wire thereof, the effect of north and south polarity being produced by changing the direction of the wrapping of the wires from left to right or right to left, as the case may be, and connecting the other wire with a ground connection, or some suitable conductor, to complete the circuit.

Academy of Sciences.

Professor Davidson presided at the regular meeting of the Academy on Monday evening last. W. F. Goad was elected a resident member. Mr. Harford presented a specimen of the rare kingfish, from Monterey Bay. Mr. Caselli presented coal from Monterey; Mr. Gilbert, of United States Coast Survey, twelve specimens of fungi collections in Washington Territory, which were identified by Dr. Harkness; Mr. J. G. Lemmon, a new species of fish from a creek tributary to the Santa Cruz River, Arizona; Mrs. Mary K. Curran, three volumes of "Genera Plantarum," by C. Bentham and J. D. Hooker.

Mrs. J. G. Lemmon read some field notes on Arizona plants, describing more particularly the Larrea Mexicana, a plant from which exudes a gum similar to the gum lac of commerce.

Signor Eusebio Molera read a very instructive paper on the Aztec calendar or Mexican Calendar stone, from which an insight has been obtained to the extent of the astronomical knowledge of the Aztecs. The stone was unearthed in the City of Mexico on the 17th of of September, 1790, and was placed in the base of one of the towers of the cathedral, where it remains to this day. The stone is eleven feet nine inches in diameter, and originally weighed twenty-four tons. The conjecture of a number of antiquarians in relation to this object were reviewed by Molera, who described its prominent characteristics by means of a painting of the same size as the original, which was prepared by himself. The central figure was a picture of the sun's face, a distorted human countenance, and about it were geometrical signs and figures of animals, reptiles, birds and specimens of vegetation. There were characters the interpretation of which presented a history of the creation of the earth. Around and about these central figures were cycles containing representations of the days of the month, the days of the year, and other peculiarities. Some antiquarians thought that it was a calendar stone, but Mr. Molera had an idea that it was designed for one of the sacrificial stones, on which captives were formerly slain, their hearts being offered to the sun. He believed it was constructed under the second Montezuma, who, having done nothing to perpetuate his name, determined to construct a sacrificial stone, the same as his predecessors had done. He wanted to made it larger than any of the others, and gave orders that it be two elbows larger than they were. The Indians began hauling the stone, which finally said it would not go any further. There were 10,000 Indians pulling the stone, and the ropes broke and the stone would not move. This the historians cited to show that supernatural phenomena was connected with the event. However, it appears that the stone was really brought to town, and it was so heavy that it broke the canal and fell down. A very finely made drawing, the full size of the stone, was exhibited, as well as photographs.

A GRAND testimonial concert will be tendered to Mr. Hugo Mansfeldt, at the Metropolitan Temple, on Tuesday, November 27th. The Harmonic Society of Oakland, with sixty members, under the direction of Mr. D. P. Hughes, an orchestra of fifteen musicians, the Hughes Glee Club (double quartet of male voices); twelve solo vocalists, and a violin quartet of young ladies of Oakland are among the participants. The programme includes eighteen numbers carefully selected. An enjoyable evening is anticipated. Mr. Mansfeldt is threatened with blindness, and he has been compelled to resign his position as organist and resign all his pupils, consequently his income is gone. In this strait his friends make an appeal on his behalf to the generosity of the public. One concert has been given—in Oakland—and this is the second.

THE Old Telegraph mine, Bingham, is shipping about thirty tons per day from the recent big strike. The ore body is said to be from twelve to fifteen feet wide across the face, and it has been explored sufficiently to demonstrate that it is one of the biggest strikes made in many a day in that great mine.

THERE will very probably be a dispute between Shoshone and Kootenai counties, I. T., as to which county the new mines are located in. It seems that the mines are on the summit of the Cœur d'Alene range of mountains, and that forms the boundary between the two counties.

MINERS are leaving Salt Lake daily for the Cœur d'Alene country, with the determination of being on the ground early.

CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

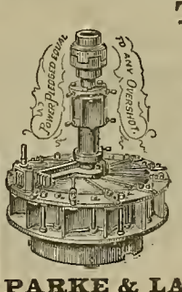
MILLS ERECTED WITH ALL APPLIANCES COMPLETE

After running one of these mills on the Whidden mine, in El Dorado County, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop-stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.



The wear and tear is nominal, and the construction so simple that any miner can put it up and run it, and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

JAS. LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

With Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE,

288,511.—SPOKE EXTRACTOR—D. S. Tallman, Reno, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through DEWEY & Co.'s SCIENTIFIC PRESS American and Foreign Patent Ageney, the following are worthy of special mention:

DEVICE FOR CONVERTINO MOTION.—Ransom G. Moody, San Jose. No. 287,307. Dated Oct. 23, 1883. The object of this mechanical movement is to convert a reciprocating rectilinear motion into a rotary motion. It consists in a shaft having a pinion, an oval or elliptical internally-geared rack meshing with said pinion, meaus for throwing said rack from one side to the other at the limit of the stroke, and suitable devices to guide its movement. The object is to transmit the motion indicated in the best manner, avoiding the employment of a crank, and enjoying the advantage for the greater part of the time of t e crank's best point.

CAR TRUCK.—Thomas J. Furbee, Bishop Creek, Iyno Co., Cal. No. 287,374. Dated Oct. 23, 1883. The truck is intended to be adjusted to narrow or wide guage tracks; and it consists in a truck, the sides of which are connected by telescoping plates, to which suitable power is applied to force its sides apart or draw them closer together. The wheeled axles are centrally divided, their inner ends being mounted on sliding boxes, which are connected with the sides of the truck, whereby their expansion or contraction effects the wheels similarly to fit them to broad or narrow track.

STATION INDICATOR.—Wm. W. Campbell, S. F. No. 287,094. Dated Oct. 23, 1883. This invention relates to certain improvements in devices by which streets or stations are indicated, when reached, to passengers within rail way cars; and it consists of a band or belt passing around certain supporting rollers, and a mechanism by which they are caused to rotate, said mechanism being connected with a device beneath the car having an arm to enter the grip-slot of a cable tube, and be actuated by means of lugs or projectors fixed at the proper positions within the tubé.

CENTRIFUOAL PUMP.—Nicholas Didiot, Bakersfield, Keru Co. No. 287,508. Dated Oct. 30, 1883. This invention relates to that class of centrifugal pumps in which rapidly rotating arms filled with water discharge a portion of their water and draw up more from the water source with which they are connected. It consists in the continuation, with said arms, of valves adapted to close the ends of oppositely extended spouts connected to said arms and the spouts when they are at rest, in order to confine the water, and to open them when revolved to permit its discharge.

FIFTH WHEEL FOR VEHICLES.—Jno. S. Klapperich, S. F. No. 287,550. Dated Oct. 30. This improvement in running gear consists of a means for connecting the front axle and bolster so that they can be turned about a central point without the use of a kingbolt to extend through and weaken the axle.

BED LOUNGE.—J. Rentschler, S. F. No. 287,165. Dated Oct. 23, 1883. The object of this improvement in bed-lounges is to gain an extention in the length of the bed when the back is let dowu as a bed, and yet not have too high a back as a lounge.

IF YOU want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. CO., for "Eubrico." It is the best compound-grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils.

Foundry Notes.

New Hydraulic Pumping Machinery.

The new hydraulic pumping machinery for the Combination shaft of the Chollar-Norcross-Savage shaft, on the Comstock, has been completed at the Risdon Iron Works, in this city, and is being tested this week before being shipped. The machinery is similar to that now at work at the Combination shaft, and is an extension of the present system. Its capacity is 2,000 gallons 1,030 feet high per minute, this amount being raised at a single lift. The machinery is intended to be operated by water taken from the mains of the Virginia and Gold Hill Water Company, though provision is made for au engine and accumulator in case of decrease of water supply.

The working pressure will be 2,000 pounds per square inch, and each part has been tested to 4,000 pounds. The machinery is to be placed on the 2,630-foot level, 230 feet below the present pump, and will throw either to the Sutro tunnel or the 2,400-foot station. This is the s'cond of these hydraulic pumps on the Comstock, and the plant is the largest of its kind in the world. The third hydraulic rig is at the Eureka Consolidated mine, Eureka. In that case the hydraulic sinking pump is adopted. Since the erection of this sinking pump it has constantly pumped 520 gallons a minute 600 feet at one lift.

The new machinery has several important improvements. The pumps will be controlled by a new valve motion invented by Mr. Joseph Moore, general manager of the Risdon works, and which will obviate all concussion or danger of over-pressure on the pipes. Saturday of this week the pumps are to be operated, and any one desirous of so doing can see them working. In next week's PRESS we shall give a detailed description of this new machinery.

Mining Share Market.

Quietness still reigns in the stock market, little business being done and quotations changing only slightly. Up on the Comstock they are hopefully working away. At the north end the joint Union Consolidated and Sierra Nevada station at the 3,100 level if completed. The south drift will be continued to a connection with the main north drift on the 3,100 level of the Mexican. Meantime its progress south will be along and near the streaks of gold quartz cut in the winze. The north drift into the Sierra Nevada will at once pass into very interesting ground, and its progress will be closely watched by mining men. At the Gould and Curry the joint Best and Belcher winze below the 2,500 level has passed through a peculiar base-metal formation of decomposed material which may be found to overlie something of value. At the Hale and Norcoss they have obtained some good prospects in the several drifts and crosscuts run on the 2,700 level, but at nearly every point they have been stopped by indications of more water than could be conveniently handled at present. This level can not be fully and squarely explored until the new hydraulic pump at the Chollar-Norcross-Savage shaft goes into operation. At Gold Hill the Yellow Jacket folks are extracting about 100 tons of ore per day, and considerable amounts are being extracted by other companies. Most of the mills on the Carson River are now running nearly to their full capacity.

Job Press for Exchange.

We have just received a new improved Rotary Job Printing Press of approved style and make, which we will sell at a bargain or exchange on favorable terms for a Washington hand press. Size of chase inside 7x10 inches.

DEWEY & Co., Publishers.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, aud, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turniug a leaf.

A. C. KNOX—Butte and Sutter counties.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First street, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below costs, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. References as to above can be had upon applying to this office.

Thanksgiving, 1883.

By the President.

In furtherance of the custom of the people at the closing of each year to engage, upon a day set apart for that purpose, in a special festival of praise to the Giver of All Good, I, Chester A. Arthur, President of the United States, do hereby designate Thursday, the 29th day of November next, as a day of National Thanksgiving. The year which is drawing to an end has been replete with evidences of Divine goodness. The prevalence of health, the fullness of the harvests, the stability of peace and order, the growth of fraternal feeling, the spread of intelligence and learning, the continued enjoyment of civil and religious liberty—all these and countless other blessings are cause for fervent rejoicing. I do, therefore, recommend that on the day above appointed the people rest from their accustomed labors, and, meeting in their several places of worship, express their devout gratitude to God that He hath dealt so bountifully with this Nation, and pray that His grace and favor abide with it forever.

[Signed] CHESTER A. ARTHUR.

By the President:

FREDERICK T. FRELINGHUYSEN,
Secretary of State.

By the Governor.

STATE OF CALIFORNIA, EXECUTIVE DEPT.,
SACRAMENTO, CAL., November 10, 1883.

Grateful to Almighty God for the manifold blessings which we as individuals and as a state have received from His hands, let us, as becomes an enlightened and Christian people, and in such manner as may seem best and most fitting to each, unite in thanksgiving to the Great Giver of all for benefits.

During the past year peace has reigned throughout our borders, plenty has smiled upon us; for all of which and many other blessings we should be truly thankful to a kind Providence. Especially should we be thankful for having escaped the ravages of the yellow scourge by which our neighbors have been so sorely afflicted.

Therefore, in accordance with a time-honored custom, sanctioned by usage, I, George Stoneman, Governor of the State of California, do hereby designate and set apart Thursday, the 29th day of November, 1883, as a day of thanksgiving and praise.

In testimony hereof I have hereunto set my hand and caused the Great Seal of the State to be affixed on this, the 10th day of November, A. D. 1883.

[Seal.] GEORGE STONEMAN,
Governor of the State of California.

Attest: THOMAS L. THOMPSON,
Secretary of State.

THE Salt Lake *Tribune* has received a letter from Emery County, Utah, giving a description of a mining district recently discovered by Wilson and Hutchinson, near Cedar Mountain. The ore is said to be found in the sandstone, similar to that of Silver Reef, but the letter fails to give the value. Ore is said to be abundant, and wood and water plentiful. The country is reported mild and excellent for winter work.

WHEN you don't just know what ails you; when you feel aches and pains all over; when you feel tired and faint, use Brown's Iron Bitters. A wonderful reviver.

SUFFER

no longer from Dyspepsia, Indigestion, want of Appetite, loss of Strength lack of Energy, Malaria, Intermittent Fevers, &c.

BROWN'S IRON BITTERS never fails to cure all these diseases.

Boston, November 26, 1881,
BROWN CHEMICAL CO.

Gentlemen:—For years I have been a great sufferer from Dyspepsia, and could get no relief (having tried everything which was recommended) until, acting on the advice of a friend, who had been benefited by BROWN'S IRON BITTERS, I tried a bottle, with most surprising results. Previous to taking BROWN'S IRON BITTERS, everything I ate distressed me, and I suffered greatly from a burning sensation in the stomach, which was unbearable. Since taking BROWN'S IRON BITTERS, all my troubles are at an end. Can eat any time without any disagreeable results. I am practically another person. Mrs. W. J. FLYNN,
30 Maverick St., E. Boston.

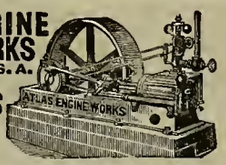
BROWN'S IRON BITTERS acts like a charm on the digestive organs, removing all dyspeptic symptoms, such as tasting the food, Belching, Heat in the Stomach, Heartburn, etc. The only Iron Preparation that will not blacken the teeth or give headache.

Sold by all Druggists.

Brown Chemical Co.
Baltimore, Md.

See that all Iron Bitters are made by Brown Chemical Co., Baltimore, and have crossed red lines and trade-mark on wrapper.

BEWARE OF IMITATIONS.



BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

Addresses. Business letters should be addressed and drafts made payable to DEWEY & Co.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

W. H TAYLOR, Pres't. JOSEPH MOORE, Sup't
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

PACIFIC IRON WORKS

PARKE & LACY,

21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of tho valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of tho air entirely prevented at any preseure. Takes less water to cool the air than any other Compressor.

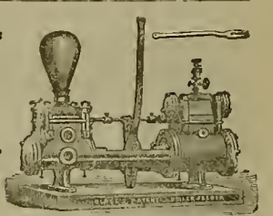
Power applied to the best advantage. Access obtainahlc to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no hack or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of ahout 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.



The Korting's Injector Is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,

Room 7, 109 California Street, - - - SAN FRANCISCO, CAL

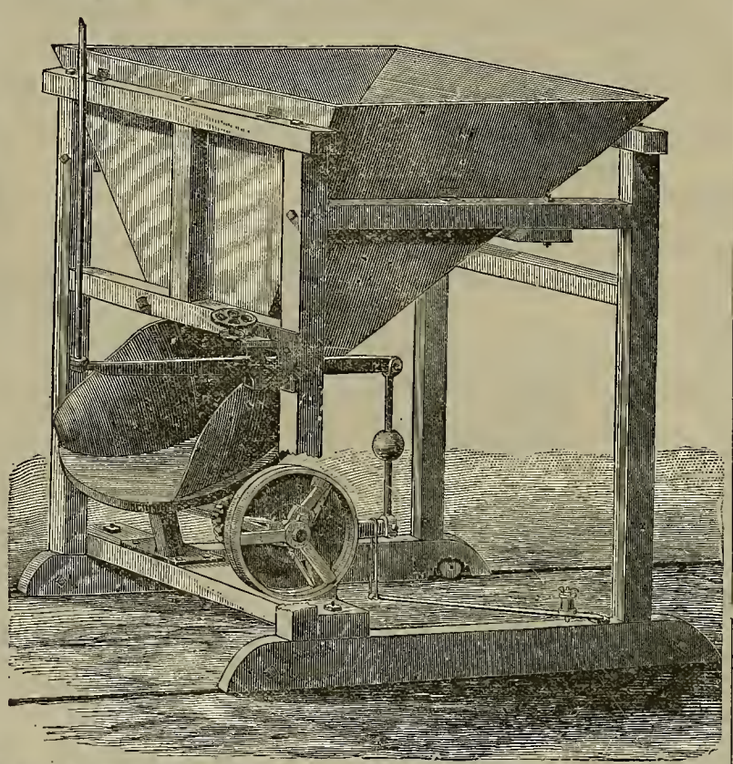
"Challenge" Ore Feeders.



OVER 1100 HAVE BEEN IN SUCCESSFUL OPERATION.

Awarded First Premiums at the Preceding and last Industrial Fairs of the Mechanics' Institute of San Francisco.

TWENTY PER CENT. MORE ORE CRUSHED WITH FIFTEEN PER CENT. LESS WEAR OF IRON THAN BY THE OLD METHOD OF HAND-FEEDING.

The opposite cut illustrates the recently-introduced Grip and Spring Attachment, which replaces the Weight originally used and result in an obvious improvement.

The practical operation of the large number of these machines now in use demonstrates the fact that the principle upon which a perfect Ore Feeder *must* be constructed is that of a *carrier* and not that of a shaking table. Uniform feeding is no possible upon the latter plan. The ore must be *evenly carried* upon a steadily-advancing plane or table to the line or point of discharge, and there be simply dropped. Jerky or spasmodically acting contrivances will not answer the purpose for feeding wet or sticky ores, nor for the ores of mines where they may change from sharp quartz to an intermixed material of quartz and earthy matter.

These Feeders are in Successful Practical Operation in the Following Quartz Mills, and are giving Perfect Satisfaction to their Managers.

Triangular and Four-Sided Mining Claims.

The question of parallel end lines of mining claims has frequently been discussed, but miners are not always as careful as they should be with their locations in conforming to the rules with respect to them. In regard to the necessity of parallel end lines, the matter is fully explained in the decision of the Secretary of the Interior in speaking of the claims of certain New Mexico miners, wherein he refers to the decision of the U. S. Supreme Court in the case of the Eureka Consolidated Mining Co. vs. the Richmond Consolidated Mining Co., in which it was held that Section 2320 of the Revised Statutes requiring the end lines of each claim to be parallel with each other is merely directory, and no consequence is attached to a deviation from its direction. (5 Sawyer 131.) But the Hon. Secretary further states that the statutory direction as a rule should be followed, and that he fully approves of the practice of the Land Office requiring surveyers to conform thereto in the respect named.

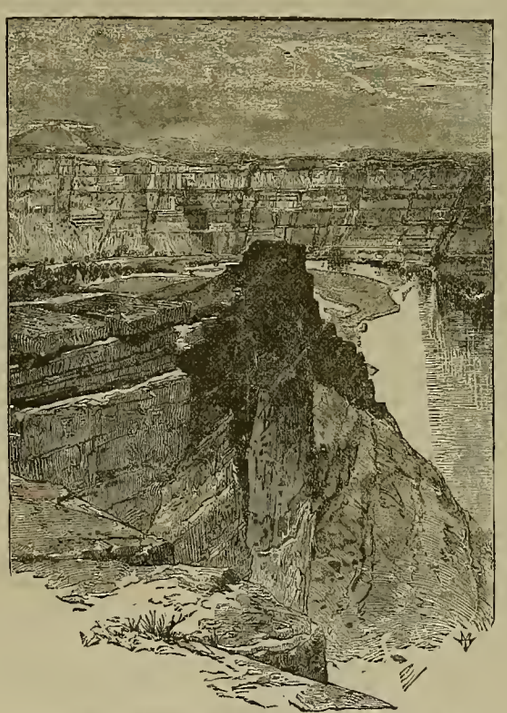
There is no authority for the location or patenting of lode claims triangular in shape. If the provisions of section 2320 of the Revised Statute in the matter of location are complied with, no good reason can exist why a survey of a mining claim need be triangular in form, though with the proper exclusion made, the *surface ground* claimed by an applicant and embraced in his patent may present on the plat of the survey, the lines of which conform to the law, an irregular form or aspect.

A short time since U. S. Surveyor-General Rollins, of Tucson, Arizona, sent to the Acting Commissioner of the General Land Office a diagram of the Grand Dipper lode, requesting instructions before approval of the survey. The survey of the claim, made by the deputy, cut off a portion of the right end shown to be in conflict with the Emerald lode, the easterly end line of the Emerald claim thus becoming one of the boundary lines of the Grand Dipper, and not parallel to the easterly end line of the Grand Dipper survey.

The Commissioner sent back word that he did not see how the Surveyor-General could approve such a survey. No reason existed why the survey lines should not conform directly to the lines of the location, they being properly run in the first place. The instructions of the Land Office, (Copp's Mineral Lands, 2d Ed., p. 217), are intended to meet just such a contingency, and that conflicts with other claims may be clearly shown and not avoided, the manner is there laid down in which intersection with conflicting claims may be noted, and of the running of courses and distances from such points of intersection to establish corners of such conflicting claims.

PREPARING GLASS FOR CATHEDRAL WINDOWS.—For the preparation of cathedral glass, flashed or wholly colored, blown or cast plates are, under a German patent, coated with a mixture of equal parts of pulverized basalt, potash, saltpeter and calcined borax, made into a paste with water and subjected to a red heat after drying. The temperature must be high enough to fuse the coating and soften the glass simultaneously. The cooling is effected in the usual manner.

THE Kicking Horse Pass, on the Canadian Pacific, has been abandoned.



Iron Ore.

There is only one place in California, one place in Oregon, and one in Washington Territory where iron ore is mined. This is rather owing to lack of suitable fuel in proximity to the ore than to lack of ore, as that has been found at a number of places where it is not yet utilized. The only iron mine being worked here in this State is at Hotaling, Placer Co. The mine produced 4,500 tons of first-class iron in 1881. In 1882, 990 tons were made, when a disastrous fire destroyed the works. They were rebuilt, and production is now going on, most of the iron being consumed here. The Puget Sound mine in Washington Territory has one furnace. They employ about 225 men. The Oswego Iron Co. employs about 400 to 500 men. This company is controlled by the Northern Pacific Railroad Co., most of the iron produced being held for the requirements of the road.

Iron is brought to this city from England on returning grain vessels at comparatively low rates of freight, considering the distance; and while the consumption is heavy, the prices paid for the crude metal are by no means exorbitant. Iron ore is now mined in twenty-five States and Territories, as follows: Maine, Vermont, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, Georgia, Alabama, West Virginia, Kentucky, Tennessee, Ohio, Michigan, Wisconsin, Minnesota, Missouri, Texas, Colorado, California, Oregon, Utah and Washington. Very large deposits are found near Lake Superior, in Michigan and Wisconsin; near Lake Champlain, in New York; in Southeastern Missouri; in Northern New Jersey, and at Cornwall, Lebanon County, Pennsylvania. These are the principal sources of iron ore supply in the United States. Smaller deposits are innumerable, and are usually in the hands of individuals, who often lease them to furnace men for a royalty of from twenty-five to fifty cents on every ton of iron mined. The United States produces between 7,000,000 and 8,000,000 tons of iron ore per year.

Colorado River Scenery.

In Powell's "Exploration of the Colorado River of the West" are many graphic descriptions of magnificent scenery, and many engravings representing the salient features of the region. One of these engravings is shown herewith. It is described in the chapter relating the trip from the month of the Uintah River to the junction of the Grand and Green. A long distance below the mouth of the Uintah they enter the mouth of another canyon, almost imperceptibly, as the walls rise very gently. The river sweeps in great and beautiful curves, the canyon walls steadily increasing in altitude. The escarpment formed by the cut edges of the rock are often vertical, sometimes terraced, and in some places the treads of the terraces are sloping. In these quiet curves vast amphitheters are formed, now in vertical rocks, now in steps. The salient point of rock within the curve usually broken down in a steep slope, and the party occasionally stopped to climb up at such a place, where, on looking down, they would see the river sweeping the foot of the opposite cliff, in a great, easy curve, with a perpendicular or terraced wall rising from the water's edge many hundreds of feet. One of these being symmetrical in form, they named "Sumner's Amphitheater," and a view of this we give. The cliffs are rarely broken by the entrance of side canyons, and the boat sweeps round curve after curve with almost continuous walls for several miles.

SUMNER'S AMPHITHEATER, COLORADO RIVER.

The Northern Belle Decision.

The decision in the case of the Holmes Mining Co. vs. the Northern Belle Mining Co., by which the former gets $360,000, is the sensation of the week. The companies operate at Candeleria, Columbus Mining District, Nevada. The Northern Belle is one of the few mines in the United States that have been successfully developed without the aid of an assessment. It has paid 71 dividends, aggregating $2,425,000, and still has ore in sight. The suit of the Holmes, which was for damages on account of alleged trespass, did not attract much attention at first, though very able counsel was employed. The somewhat unexpected decision, however, has attracted universal attention to the matter. The conflicting testimony on the two-ledge theory by the mining experts Raymond and Keyes was somewhat remarkable. The closing scenes of the trial are thus described by the Carson *Appeal* of November 25th: "Yesterday morning Hon. Thomas Wren opened for the defense, and was followed by Colonel Thornton. Judge Boalt closed the case for the plaintiff. During the speeches of the lawyers the court room was packed with attentive listeners, and each man who took the floor held his audience for two hours. At a quarter past four o'clock yesterday afternoon Judge Boalt had finished, and there was a general crowding in the front to listen to Judge Sawyer's charge, but he adjourned the court until six o'clock. At six o'clock Judge Sawyer gave his charge to the jury. He decided that the line separating the Northern Belle from the ground claimed by the Holmes had been fixed by the surveyors and established beyond controversy. The questions involved in the one and two ledge theory he left entirely with the jury, remarking that they had heard the testimony of the experts and must judge for themselves. As to the question of damages, he held that if damages were awarded they must be allowed for the rock as it stood, as the trespass, if any, was intentional, and the defendants should not be allowed any thing for the expense of mining and milling. Both sides conceded that the charge was impartial. The jury then retired."

SOUTHERN MINES.—Mr. E. Chanvin has a mine on White River, twenty-eight miles east of Delano, Kern River, on which the biggest vein is from ten to twenty feet wide a few feet from the top. The lode runs north and south. He also has a mine on Deer Creek, Tulare County, thirty miles from Delano. The lode is from four inches to five feet. It runs a little east of north and south. We have been presented with specimens of ore taken from a depth of ninety feet from the surface of the latter mine which assay from $66 to $100 per ton. The ore is gray and black, and is of fine appearance, containing silver. On the mine of the Delano Gold and Silver Mining Company from the vertical ninety-foot shaft a drift north has been run fifty-five feet and south seventy-five feet. We also have a dark, rich-appearing specimen from this lode also. We expect to hear favorably from future development of these mines.

LUTHER WAGONER, of the firm of Wagoner & Hammond, mining engineers, has returned to this city, having resigned the superintendency of the Minas Nuevas M. Co., Sonora, Mexico. Mr. W. promises us at an early date, a paper on leaching and smelting as carried on at the mines referred to.

CORRESPONDENCE.

Recollections of California Mining Life.*

Men and Events in the Pioneer Days—No.4.

[Prepared for the MINING AND SCIENTIFIC PRESS, by HENRY DEGROOT.]

Their Fortunes and Their Fate.

And where are they, and how have they fared, these pioneers of the pioneers—what is to be said of them, these eye-witnesses of the great gold find—these men who were preseut at this new birth of Califoruia? Rich—millionaires, every one of them, we are ready to exclaim—very sybarites, living in palacial mansions, the recipients of that adulation and homage that large wealth never fails to inspire. In view of the great opportunities enjoyed hy this first crop of the Argonants, it would naturally be supposed that they had amassed riches heyond measnre. But what are the facts? Unfortuuately, quite the reverse of what the majority of mankind would expect, and very unlike what all could wish them to have heen. Not one of these meu who were so permitted to skim the cream from the new El Dorado ever hecame rich; hardly any of them ever acqnired, or at least retained, so much as a competence, while some remain, as others have died, miserably poor! Take for example tbe cases of Snter, Marshall, Wimmer aud Bennett, who figured so conspicuously in connection with the gold discovery: These men, though first on the gronnd, profited little in tbe end by that event—would have been hetter off, indeed, had it never occurred. It proved fatal to all, and especially so to Sutter, who, up till that time, had been successful in all his mnltifarious undertakings—was, in fact, on the road to position and fortune, with the prospect of becoming in a few years the richest, as he was already the most active and enterprising, man in all California.

What Worked the Pioneers' Downfall

Was this very discovery of gold, or rather the large and promiscuons immigration that it led to. That General Sutter was unable to cope with the sharpers brought hither hy the inflowing tide, and who afterwards songht to circumvent him in every possihle manner, or that he failed to protect bis property against the rahble that tried to wrest it from him, proves nothing against his capacity as a financier or his efficiency as a business man. These new comers, with hardly more appreciation of the rights of the early settler than the Bedouins of the desert, squatted on his lands, dispersed his domesticated Indians, stole his cattle, and appropriated without compunction or stint whatever else of a useful kind they could conveniently lay hands upon. To contend with these hordes, armed with rifles and revolvers, and the still more dangerous instrnmeutalities of the law, would he like battling with a pack of ravenous wolves. That the hardy pioneer was dcspoiled of his property and finally vanquished in tbis unequal fight implies neither incompetence nor neglect on his part. Few men would, under the circumstances, have managed their affairs better, or resisted this system of wholesale despoiliation more efficiently than did he.

General Sutter was in many respects a very superior man. His intellectnal endowments were of the highest order. Physically he was equally well favored, being well proportioned and otherwise of great bodily perfection. He was highly educated, first in the schools and afterwards to the profession of arms, the versatility of his talents being manifested by the creditable manner in which he acquitted himself in hoth these callings. His aptitnde for the acquirement of knowledge is evinced by the facility with which he read and spoke four different languages. He natnrally possessed the instincts, and always, even in the midst of his rude surroundings, managed to preserve the manners and bearing of the gentleman, soldier and scholar. And yet, with so much to lift him above the common level, he was utterly without ostentation or vanity. Though learned and well acquainted with hooks, he was thoroughly practical, showing ou all occasions the sagacious, enterprising man of affairs. He was the first to introduce any thing like new ideas and modern improvements into California. Though he did not put up the first flonring or the first saw mill in the country, he was the first to erect establishments of this kind with a view to mannfacturing flour and lumher for the general market. He was also the first to engage in the growiug of wheat and the cultivation of the land on an extended and systematic scale.

The Testimony of General Bidwell.

Gen. John Bidwell, himself one of the earliest, as he is also one of the noblest of the pioneers, bears efficient and kindly testimony to the high qualifications, personal merits and rich deservings of Gen. John A. Sutter. In a letter written not long since to Capt. Wm. F. Swasey, and now in the possession of the Society of Califoruia Pioneers, Gen. Bidwell, among other things, remarks as follows, his statements being here somewhat abbreviated: "General Snter, when I first saw him in 1841, seemed to me the grandest man I had ever met with. Of a fine presence and agreeahle deportment, he spoke German, French, Spanish and English fluently and well. As a conversationalist he excelled, heing at home in the most refined and intelligent company. Yet be was not the least ego-tistical, but listened respectfully to every one, the highand low alike, and hy his courteous manner making all with whom he came in contact his friends. He was a man of the purest honor and the strictest integrity. The California officials had such confidence in all he said or promised that when he sought land for a colony they readily granted all he asked for, and immediately put him in possession of the same. All who knew were ready to trust him, the Russian Fnr Company having sold to him, at the stipnlated price of $100,000, bnt wholly on credit, their entire property at Fort Ross and Bodega. Becoming jealous of his growing power and exasperated at the partiality he manifested towards the American settlers, the Mexican anthorities in California began at last to threaten Gen. Sutter, going so far as to talk of expelling him from the country. When things had reached this pass Sutter advised these intermeddlers that they had better refrain from further threats of this kind, as he was in a position to successfully resist any interference with his rights, and that if these menaces were repeated he might himself be constrained to act on the offensive, his main reliance in case this hecame necessary heing npon the small nnmber of Americans, not over fifty or sixty, then living in the vicinity of the Fort or settled in the Upper Sacramento Valley. This defiant attitude of Sutter towards the departmental anthorities having heen reported at the national capital, Mitcheltorena was dispatched to California with 500 troops, for the purpose of crushing out this growing spirit of insnhordination, and, if need be, driving every American, Sutter included, out of the country. So far from accomplishing snch task, this doighty commander, who was also appointed Governor, found it expedient to make friends with Sutter and his adherents, affairs having ultimately takeu snch turn that he who had come to expel others was himself expelled from California."

Continning, onr worthy informant goes on to remark upon the honndless generosity of General Sutter as manifested towards all who, from sickness, misfortune or other canse, reqnired assistance. No man, rich or poor, whatever his position in life or nationality, ever applied to Sutter for aid in vain. Whoever asked received, nor did he always wait for the snffering and needy to come and make their wants known. When he heard of an incoming immigrant train snowbound in the mountains, or suffering from want of food, he at once sent them provisions on pack animals, in charge of trusty men, these relief parties going sometimes far into and even quite across the Sierra on these errands of mercy. All who arrived at the fort destitute were supplied according to their necessities, and this without any charge heing made or any thing said abont future compensation. There being at that day no hotels or public houses in the country, all who came to Sutter's establishment desiring to stop were there entertained as free gnests, however long they chose to remain. When General Bidwell and his compauions entered the country, Sutter, hearing that there was a party coming in who were in need of provisions, forwarded them supplies while they were yet in the mountaius more than a hundred miles away.

It was by noble and disinterested acts like these, running tbrough a series of years, tbat Geueral Sutter managed to so attach to his cause the entire foreign popnlation, and even many of the native Californians, that when the final outhreak occurred the conquest of the country became an easy matter. That the snhjngation of California did not cost us a long aud bloody struggle is largely due to the course pursued by Sutter and his coadjutors prior to the commencement of active hostilities.

As a partial recognition of ohligations for the service so rendered, the Legislature of this state some years ago voted General Sutter a monthly stipend of $250, limiting the same to a certain nnmber of years. On the expiration of this period this subsidy failed to he renewed, nor have the efforts since made by some to procure a re-enactment of that law ever met with success. As a conseqnence, this fast friend of American institutions and interests in the Far West, this planter of the new civilization on the Pacific Coast, the hardy explorer and typical pioneer, worn ont with toil and weary with waiting, passed into the sere and yellow leaf of life, his last days pinched with want and clouded with sorrow. On the 18th day of June, 1880, the eventful career of the Switzer soldier was brought to a close in the city of Washington, whither he had gone several years before, in the hope of obtaining from Congress some slight compensation for the property of which he had been so nnjustly deprived and the sacrifices he had made in behalf of republican institutions and the American people. Throngh neglect and delay the ingratitute of California was paralleled by the injnstice of Congress, which body, always professing a willingness to do justice to General Sutter, temporized until it was too late. Several members of the House, however, attended his funeral, and there is even a talk of having a stone placed at the head of the old man's grave. It would not indeed he at all strange if, after so starving him to death, California should take measures to erect a grand monument over his remains. This is the way the world often treats its heroes! The body of General Sutter, who was seventy-fivo years old at the time of his death, was taken to the little town of Letitz, in Pennsylvania, where his daughter resides, and there interred in the hnmble graveyard of the place. By his side his aged and estimable wife, since deceased, has also heen huried.

As for Marshall.

Dating from the time of the gold discovery, the story of his life is briefly told. Having during the few months that followed that event collected considerable gold, some of it being a sort of tribnte paid him and Sutter by the Indians, he concluded to leave the diggings, whicb he did. After a short absence he returned and again went to mining, at which he afterwards met with only moderate success. Tiring of this business, he hetook himself to fruit and vine growing, on a patch of land that he had always occupied near the mill, or Coloma, as the town that had here grown np had come to he called. Planting only trees and vines of choice varieties, Marshall had here in the conrse of a few years the best nursery and vineyard in that section of country. Having lived here for some time in a comfortable sort of way he parted with this place, and afterwards does not seem to have had any permanent home or to have remained long in one place. For a time, and up till a year or two ago, he was living in a cabin at Kelsey's Diggings, an ancient mining camp on the opposite side of the river a few miles above Coloma. Latterly he has been sojourning elsewhere in the central mining counties, visiting occasionally San Francisco, Sacramento and other of the larger towns. He is now quite poor, but does not appear to worry over his present condition nor the outlook for the future. By reason of his former history and many good persoual qualities, he is generally well liked, and receives everywhere a cordial welcome. Though an unlettered man, Marshall is intelligent and thonghtful, and, between his reminiscences and a large fund of general information, is capahle of not only entertaining a promiscuous crowd but also of interesting persons of mental culture. He is odd in many of his ways—in some peculiar to the verge of eccentricity—heing little governed hy the opinions of others, and quite indifferent to the etiqnette of conventional life. Taken altogether, he is an agreeahle sort of fellow, and not unsociable, once his confidence is gained—the which is not an easy matter, the scurvy manner in which he fancies he has been treated by the State of California in refusing to properly reward his services, having rendered him somewhat misanthropic and suspicious of strangers. It would really seem as if the state might make some little provision for the old man in his declining years, seeing he is so very needy, and was the actual discoverer of gold, an event generally conceded to have heen a great public blessing. To Hargrave, the discoverer of gold in Australia, there was given a donation of $75,000, and simple justice requires that something shonld be done for Marshall. For a time he did receive from the state of California a subsidy of $100 per month. But the period for which this was to be continued having expired, the Legislature refused to renew it, fearing its further payment would he too great a strain on the financial resources of the state.

Harrisburg Mining District.

EDITORS PRESS:—The mines of this district are situated about 329 miles southwest of Salt Lake City, in Washinton County; the east boundary of the district forms part of the west boundary of Kane County.

The geological formation is stratified red and white marl sandstone, at places greatly broken up and eroded. Here and there the said sandstoue alternates with thin seams of clay shale; the cementing material between the sandstone is lime; petrifications of trees, branches, leaves, and ferns, such as are peculiar to the coal formation and identical with the same, are everywhere in great abundance. I have not the slightest doubt but coal will be fouud in the vicinity.

If we observe and examine the large extinct volcauoes which occupy the center and southern part of Utah, together with the volcanic rock which appears here everywhere, we can not be surprised at the foldings and contortions of the strata. The great plains bear abundant and conclusive evideuce to the erosion that has taken place here.

The whole basin was certainly at some remote period a great inland sea, part of "Lake Bonneville," the remnants of which we see to-day represented hy the Great Salt Lake and Lake Sevier. The bed of this "Lake Bonneville" was without doubt on a level with the surrounding table mountains, as the shore lines distinctly marked along the base of the great mountain ranges all over Utah verify and demonstrate. Since then the strata have been beut, folded and broken by volcanic action. The upper portions have heen washed away, leaving the reefs as the anticlinal croppings dipping toward each other on opposite sides of the valley. Here and there the formation is covered with volcanic material, forming as it were a cap to the sandstone.

These beds of red and white sandstone, in particular the white sandstone, which is of a finer texture than the red, are impregnated with chloride of silver, carbonate and iron. Some of the latter appears in nodules aud assays very high in silver.

The dissimilarity of the ore in these sandstone layers and beds is so vast that a very careful sampling of all the material is a great and absolute necessity. The assay value varies from $20 to up in the thousands.

There are only two reasons or causes to account for the presence of ore in these sandstone beds. The first is by sublimation, the mineral vapors ascending from below and depositing the ore in the pores of the sandstone, with other words, impregnating the sandstone. The second is a contemporaneous formation of the ore with the beds in which the same appear; in other words, in explanation, the mineral was precipitated at the same time that the beds of sand and clay, which are now marl sandstone and clay shale, were formed.

This mineral must then of course bave been in solution, and mingled with the waters which, as the waves precipitated the mineral among the sand and clay, and at such places where there was the most vegetable mold, carbon and iron in greater quantities. As both sonrces have their pro's and con's I do not find it necessary to argue about these sources or adopt either of them at this time.

The leading mines in Harrisburg mining district are: Bonanza, which has been very extensively opened and developed by numerous shafts, tunnels and drifts. The main shaft cuts the ore deposit at a depth of 45 feet. The Leads Mining Company have opened and extensively developed their mines and ore deposits in many places; a shaft with double compartment is continually advancing downward. Attached to the mine is a ten-stamp mill. Tecumseh and Barbee and Walker are developed very extensively, and have and are producing largely on a dividend-paying basis. Stonewall Jackson, St. Johns, Shepherd and Leman, Silver Flat, Scott, Silver Point, Silver Crowu, Stormy King, Savage, Stormont, Butte, Bennett, Buckeye, Chlorite Chief, California, Duffin, Emily Jane, Great Western, Interval, Kinner, Luna, Leopard, Maggie, McNally, Maud, Pride of the West, Regina, Thompson, Vauderbilt, and several others more or less extensively developed, and all worthy the attention of both miner and capitalist.

Twenty-two miles north of Leeds is Silver Belt mining district, in Iron County; the character of the ore and the formation of which district are similar to those described in Harrisburg.

W. BREDEMEYER, M. E.
U. S. Surveyor.

Neglected Mines.

San Luis Obispo County has been proven hy prospectors and previous productions to be rich in minerals, but of late we hear very little of any mining carried on or the shipment of minerals. Here are great resonrces now lying neglected. Among the minerals produced have been cinnabar, chrome, copper, asphaltum, gold, salt, lime, silica, gypsum, onyx, snlphur aud coal. Others are known to exist. At one time quicksilver mining was carried on extensively, and large quantities of the liquid metal produced. This was done hy incorporated companies in a period of excitement and high prices, with extensive establishments conducted in the most expensive and extravagant manner, and failure was the general result. But the fact that many hundred thousand dollars worth of quicksilver was obtained is proof of its presence in abnndance, and it appears that under a more economic system, conducted hy co-operative miners, a profitable industry could be maintained. Quicksilver mining has been abandoned in this county, hnt the mines are here and the field is an inviting one for working miners to enter and reopen them with a fair promise of reward for their labor. Where great companies could not pay expenses, much less dividends, with plants costing $200,000 and officers' salaries aggregating thousands monthly, miners might make money. Last year there was a good deal of chrome mined and shipped from the various ports of the county, but since the unfortunate death of Mr. Lewin Wethered, by the railroad accident at Tehachipa last January, the industry seems to have died ont. We occasionally see small shipments of chrome, hut nothing in comparison to former times. Wethered was en route to Baltimore and Washington, in the interest of chrome mining in this county, at the time of the accident, and no one has come to take his place in the encouragement of the business. There is no question of the great abnndance of chromium in this county, and its extraction offers a profitable field for labor. Asphaltum is mined to a limited extent, and this constitutes the chief of our mineral shipments at preseut. Sulphur is found in unlimited quantities, and near the shipping points, hut the world is ransacked for iron pyrites and other miucrals bearing sulphur, while the beds of the nearly pure snbstance in this county are neglected. The gold mines of La Panza are occasionally worked, and afford support to a small community. There is a large area of gold-bearing country in the eastern part of the county, which, although not exceedingly rich, will pay better wages than most laborers receive. Large veins of copper and many rich bowlders of the ore are found in the northern coast region, and the mining of these was once carried on with profit. These are indnstries that should be revived, and the mineral resources of the county, which are certainly great, he made to add to the general prosperity.—*San Luis Obispo Tribune.*

MECHANICAL PROGRESS.

Important to Steam Users.

The water-gauge is one of the most important fixtures pertaining to a steam boiler, and upon its indications the safety of the boiler in a great measure depends. Therefore it behooves the engineer and the steam user to look sharply to its condition at all times, and see that it is in proper order, and that its indications show the true level of water in the boiler.

Probably the most reliable of all the different forms of apparatus that have been devised for showing the height of water in steam boilers is the ordinary gauge cock, properly located and kept clean, says the *Locomotive*. The glass gauge is a valuable adjunct in the hands of a careful man, but as ordinarily constructed is very apt to become stopped up, unless the water is more than ordinarily pure, and then, if too much reliance is placed upon it, its indications are not only useless, but absolutely dangerous. Many accidents that have occurred have undoubtedly been due to the passages to the glass having become filled up with sediment, so that the water-level indicated by the glass was not that of the water in the boiler. When a glass water-gauge is used, more especially when it is placed with the gauge cocks on a column, or "combination," as it is usually called, it should be thoroughly blown out at least three times every day. Merely opening the drip-cock at the bottom of the glass connection for a few seconds is not enough. Remember that there are two passages to the glass, both of which must be kept clean to give the glass any value as a water-gauge. When the glass is to be blown out, close the stop-valve at its upper end, and blow out the water passage at the lower end, then close the stop-valve at lower end, and blow out the steam connections. When you have blown out the glass sufficiently, don't forget to open both valves and leave them open.

With a gauge cock it is different. The very act of "trying" them assists in keeping them clean. The best way to connect them to a boiler is to run each one separately into the boiler straight through the front head. No bends in the pipe should be admitted. If the pipes are straight they may be easily cleaned by running a wire through them, even when steam is on the boiler. The connections should be of good size, not less than ¾ inch pipe being used.

When the cocks are placed on a column or combination the pipes connecting this with the boiler should never be less than 1¼ inch in diameter. They are usually made one-half or three-fourths of an inch. Where bends occur in these pipes, tees or crosses should be used instead of elbows. Then by simply removing the plugs from the tees the pipes may be easily cleaned out without disconnecting them from the boiler. A half inch pipe should be run from lower end of water column into the ash-pit. This pipe should be provided with a valve, by opening which the apparatus may be blown out once or twice daily.

When gauge cocks become worn so that they begin to leak, it is very poor policy to continue them in use. They should be at once repaired or new ones substituted. When it becomes impossible for an engineer or fireman to close a cock after "trying" the water, he is very apt to try it only when he is obliged to, and very naturally too. The possible risk thus incurred of letting the water get low in the boiler is one that no steam user can afford to take.—*Miller.*

The Victory of Mechanism.

At the last meeting of the carriage builders at New Haven the question of apprentices and indentures was grasped in a business-like way, and a committee was appointed for the purpose of systematizing the instruction of new hands in the trade. Of late years it has been well-nigh impossible to obtain an intelligent native-born apprentice. Carriage builders, like other manufacturers, have suffered from the strange aversion of the Yankee boy to a trade. The class that have offered themselves are largely the worthless scum that float about the streets of a great city. Even when once indentures have been entered into, it is complained that they are continually broken, and consequently manufacturers have been compelled to place their reliances either upon foreign journeymen or to employ half-trained men from Canada.

Each ensuing day makes more prominent the fact that we have come upon the times when the mechanic is master. We have crowded professions and ill-filled trades. A chance to fill the position of sub-assistant clerk in a wholesale house is eagerly grasped at by a hundred applicants, though the wages received he scarcely more than "a chance to learn the business."

Let a master workman try to obtain an apprentice at three times the salary offered the clerk, and his applicants will be poor alike in quantity and quality. A skilled workman in any trade need never want for hire; he is eagerly sought after by a hundred employers, and his strong Saxon "wages" are twice as robust as the weak Gallic "salary" of the clerk and book keeper of an equal age or experience.

He is independent of the condition of the market; the skill and cunning of his hand and eye are too valuable to lose, and must be paid whether the products are slowly or rapidly consumed. If a reduction in force is necessary some clerk or type-writer takes his departure. If business ceases, the master hand is eagerly seized by some rival house which knows and values the products of his skill.

It is not as if this country were bound by the superstitions of the old world. A bright workman does not here rise to the level of master mechanic and there stop. There are avenues leading higher yet. The manager of the Willimantic Linen Company, who is reported as about to accept a position in the Pullman Car Company, at a salary of $20,000 a year, was but a few years ago a machinist in the Lowell Machine Shop, and this magnificent advance is not due to any sudden rise in a neglected stock, or lucky venture at an enormous risk, or sudden windfall from a distant relative. It is the natural outcome of a vigorous brain joined to a cunning hand. He who should crush down the obstacles to success in our own days must have as well as the wit to see the service the strength to deal the blow. This is an age of the steam engine, and it is the engineer, not the conductor, who is master.

And if after a career of continued success misfortune does come, commercial panic or flood, or fire, there comes from that man never a cry of "What shall I do for my bread?" The brain may have sought to go beyond its power, but the hand can not lose its cunning. The runner may have fallen short in his leap, but he is as tireless a runner as ever.—*Boston Commercial Bulletin.*

The Oil-Stone.

Twenty years ago the oilstone was found only on the joiner's bench and possibly on that of the machinist, and its sole use was the sharpening of the edges of tools. To-day its use has extended beyond this province of edging tools to that of grinding, reducing, finishing; in fact, invading the limits of the grindstone, emery, rottenstone, tripoli, and reaching almost to rouge. This stone, which is a slate known in science as novaculite—from *novacula*, a razor—is cut and dressed in hundreds of different forms for varying purposes. In any hardware or mechanics' furnishing store it may be found in all manner of shapes under the name of "slips," adapted for sharpening tools of all forms. In dentists' supply stores it may be seen in twenty or more cylindrical and circular forms, and so minute as to be used at a rapid rate of revolution even between the teeth of dental-suffering humanity. Some of these cylinders, ovoids, cones, and edge wheels are so minute that a pea looks large by their side; yet they are all veritable grindstones.

In the manufacture and finishing of the metals, the oilstone plays an important part. Our recent exaction as to fits and measures can hardly be filled except by the use of this stone, and it is in demand for truing turned surfaces and planed areas of iron and brass, slowly grinding down the edges left by the finish-file and the corundum wheel. Recently its powder has largely usurped the place in mechanics' valuation of flour of emery or emery of the higher grades. It is found that a finish "for fit" can be readily obtained by its use in much less time than that hy the scraper; and it does not leave imbedded particles of quartz or corundum to keep up a perpetual wear. This material is not strictly an *oil* stone; it can be used with any vehicle, water, benzine or kerosene oil; it is amenable to all of these. Perhaps its best use is with water, especially when the stone is of the harder sorts, as the Ouachita.—*Scientific American.*

SOFT ALLOY FOR SOLDERING.—A soft alloy which attaches itself so firmly to the surface of metals, glass and porcelain that it can be employed to solder articles that will not hear a very high temperature, can he made as follows: Copper dust obtained by precipitation from a solution of the sulphate by means of zinc is put in a cast-iron or porcelain-lined mortar and mixed with strong sulphuric acid, specific gravity 1.85. From 20 to 30 or 36 parts of the copper are taken, according to the hardness desired. To the cake formed of acid and copper there is added, under constant stirring, 70 parts of mercury. When well mixed the amalgam is carefully rinsed with warm water to remove all the acid, and then set aside to cool. In ten or twelve hours it is hard enough to scratch tin. If it is to be used now, it is to he heated so hot that when worked over and brayed in an iron mortar it becomes as soft as wax. In this ductile form it can be spread out on any surface, to which it adheres with great tenacity when it gets cold and hard.

PRESERVING TIMBER.—One of the most encouraging among the various methods which have been brought forward for the preservation of bridge timber and railroad ties would seem to he that which, in the first place, subjects the finished timber to an adequate dry heat, and then immerse it in a hot bath composed of certain proportions of asphalt and carbolic acid. The effect of this treatment is that on cooling the solvent of the asphalt evaporates, leaving a skin or coating of asphalt on the surface of the wood which resists water and keeps the antiseptic material fixed securely within the pores of the wood. The exterior of the wood, on the completion of this process, presents a smooth and dark surface, requiring no paint.

SCIENTIFIC PROGRESS.

Astronomical Observations at High Altitudes.

Astronomical observations taken at high altitudes in Peru and Bolivia during the first half of the present year have yielded some interesting results, which will be read with interest by California readers who are looking forward to still greater results in the long promised Lick telescope. At La Paz (elevation 12,000 feet), Mr. Ralph Copeland, under whose supervision the observations were made, saw stars with the naked eye that are with difficulty seen in Europe with artificial aid, notwithstanding the light of the full moon. At Puno, (12,500 feet), Canopus, Sirius and Jupiter were visible to unaided vision from 1 to 25 minutes before sunset. A number of small planetary nebulæ and stars, with very remarkable spectra, were found in the southen part of the Milky Way, hy searching with a prism attached to a 6-inch telescope on Professor Pickering's plan. The most remarkable stars showed spectra of little more than two bright lines, which Mr. Copeland had observed in the spectra of various nebulæ. Several close double stars were discovered. At Vincocaya (14,360 feet), the solar spectrum was very much increased in brightness at the violet end. At Arequipa (7,500 feet), the relative humidity of the air was as low as 20 per cent., and not much higher at other stations. Mr. Copeland believed that an observatory might he maintained with great facility at a height of hetween 9,000 and 12,000 feet, the night temperature being little below the freezing point at any season. Beyond that height an increased elevation of 150 feet roughly corresponded to a fall of the thermometer of 1 degree F., and a depression of the barometer of .1 inch, so that at 15,000 feet very arduous winter conditions were encountered. Mr. Copeland thought, however, that in the early summer an experimental station might be maintained for a few weeks as high as 18,500 feet. Pieces of apparatus 2 tons in weight could readily be transported to any of the stations up to 14,360 feet. With the possibilities from the larger and more perfect Lick telescope, made probable by the above reports, the people of California and scientists in general are greatly annoyed at the delays in the construction of that instrument. The latest information from Cambridge is that one of the two immense three-foot glasses has been lying in Mr. Clark's shop for over a year, just as it was cast, the Clarks refusing to commence their work upon it until its companion glass is placed hy its side. When that will be ready, if ever, appears to be a problem to he solved only by time. There is no doubt about the ability of the Clarks to grind and polish the objective if the material ever reaches their hands, but the difficulty in obtaining a solid disk for crown-glass 3 feet in diameter, perfect in all respects, can hardly be appreciated. It will thus be seen that however forward the observatory may be a long time may elapse before the great 36-inch Lick telescope will be in position, ioterpreting the mysteries of the heavens throught the exceptionally clear atmosphere of a California sky.

ATMOSPHERIC ELECTRICITY.—Some time since we published a brief account relative to a series of experiments on the above subject made by Dr. L. J. Blake, and in which it was stated that no convection of electricity takes place by the rising vapor from a charged liquid surface. Further particulars which are now at hand show that Dr. Blake gave to the liquid a potential due to from 400 to 500 Daniel's cells. A plate placed in the track of the vapors was, in the different experiments, either colder than the vapor or of the same temperature. By connecting the liquid with the electrometer, he found a small negative charge increasing during the fifteen minutes which each experiment lasted, but not sufficiently to justify the statement that the electricity is generated by evaporation. In all the work the lamp was removed before connecting with the electrometer, and the whole apparatus was within a metallic covering connected with the earth. Distilled water, sea water from the North Sea, alcohol, sulphuric acid, mercury, and solutions of a number of different salts were tried.

BORIDE OF ALUMINUM.—Joly obtained a boride of aluminum, $BoAl$, in hexagonal golden plates, by reducing boracic acid with alumiuum in graphite crucibles. These crystals were studied before by Deville and Wohler, being known as boron diamonds. Hampe has taken up their study again. He also obtained Bo_6Al as large black lamellar crystals; also yellow quadratic crystals with brilliant luster, inclosing carbon and aluminum. Fourthly, he obtained one or more compounds of boron and carbon, which have not yet been investigated.

A NEW MINERAL.—MM. G. Cesaro and G. Despret have given the name "richellite" to a supposed new mineral from Richelle, in the neighborhood of Vise, Belgium. It occurs in compact masses which have a creamy-yellow color, becoming ocher-yellow on alteration. Its luster is greasy or resinous to earthy, and its hardness varies hetween 2 and 3, the specific gravity being 2. An analysis gave the following results: P_2O_5 Fe_2O_3 Al_2O_3 CaO. At 100 degrees the mineral loses 23.33 per cent water, and at a red heat 6.10 water and 0.11 hydrofluoric acid. MM. Cesaro and Despret leave the composition of the mineral in doubt, but regard it as a fluophosphate of iron and calcium, the fluorine being, in their view, in combination with the iron; the microscopic examination which they propose to make will perhaps throw some light upon the subject.

WOODEN TAPS.—All wooden taps used for chemical purposes may be well preserved by plunging them into a bath of pure paraffine heated to 110° or 120° C. This temperature must he kept up as long as we perceive any air bubbles arising from the wood. The bath is then, and then only, allowed to cool gradually, and the taps are taken out just as the paraffine is about to solidify. The excess of paraffine which still adheres to the outside is rapidly wiped off with a cloth, and the tap is finally subjected to an energetic friction with the same cloth. After this treatment an ordinary wooden tap, which, generally speaking, is soon unfit for use, may be preserved for a considerable length of time, and will be found to resist the corrosive action of dilute acids perfectly. Many other objects in daily use in the pharmaceutical laboratory may be advantageously treated in the same manner, and so preserved for a long time from the effects of corrosive liquids, damp or oxidation.

RADIATION OF SILVER AT THE MOMENT OF SOLIDIFYING.—At the International Electrical Congress, in 1881, J. Violle proposed as an absolute photometric standard the radiation of a square centimeter of melted platinum. Dumas approved of the proposal, and at his invitation Violle performed some preliminary experiments with silver. From the moment when solidification begins, in contact with the containing vessel, until the whole becomes solidified, the radiation of the liquid part remains constant. The constant portion of the radiation is so sharply defined that silver may furnish a secondary fixed standard, which will be especially convenient in all the measurements of spectro-photometry.

THE BEAUTIFUL SNOW.—A Swiss scientist, Floegel, is said to have found, in examining the residue from the evaporation of freshly-fallen snow, living infusoria and algæ, bacilli and micrococci, mites, diatoms, spores of fungi, in immense numbers; also, fibers of wood, mouse hairs, pieces of butterfly wings, skin of the larvæ of insects, cotton fibers, pieces of grass, epidermis, pollen grains, rye and potato flour, grains of quartz, minute pieces of roofing tiles, with bits of iron and coal. Still poets continue to use snow as a symhol of absolute purity.

NICKEL CRUCIBLES.—Nickel crucibles, instead of silver ones, are recommended by M. Mermet for use in chemical manipulations. Nickel, indeed, is slightly attacked by melted potash, hut so is silver itself. Nickel crucibles cost at first much less than those made of silver, and, moreover, they have the great advantage of melting at a higher temperature. It often happens that inexperienced chemists melt their silver crucibles in heating them over a gas lamp; but such an accident is not to be feared in working with crucibles made of nickel.

THE CENTRAL PARK OBELISK.—President Barnard, of Columbia College, in a letter recently published, gave the result of careful computations which he had made relative to the disintegration of the Central Park obelisk's surface due to exposure to the weather. His opinion is that it will take 6,000 years of exposure in this climate to reduce the volume of the obelisk to the depth of one cm. on each side. "The waste in a century would he, therefore, scarcely a perceptible amount," he concludes.

THE SOLAR PARALLAX.—The number of photographs taken of the sun at the recent transit of Venus were 1,700, fully 1,380 of which were sufficiently perfect for measurements; while the transit of 1874 yielded only 221. As the calculations to be made must depend upon the careful measurements of all these photographs, it is computed that at least four years may occur before any definite results can be arrived at.

ARTEMISIAS AND PHYLLOXERA.—M. Poirot having observed among the artemisias which cover immense regions of North America neither flies nor worms nor any insects, also no scorpions or tarantulas, has suggested that the plant might prove adverse to the metamorphosis of phylloxera by covering the ground with branches of artemisias.

LIGHTNING AND RAILROADS.—The idea that lightning is not so destructive as it used to be in the United States, because the network of railroads and telegraph wires lessens the number of accidents, is met by the record of the summer. Fatal thunderbolts have never been more common.

THE SUN'S DISTANCE.—The latest observations indicate that we are distant from the sun 92,700,000 miles. These are the figures obtained as near as may be from the observations of the last Venus transits.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAMMOTH.—*Ledger*, Nov. 24: The upper tunnel has reached a point a little over 100 ft from being underneath the main shaft. It is being pushed ahead as rapidly as possible. The new ditch to the Mammoth mine is to be completed next week. There are 30 men working on it. When finished the ditch will have a capacity of 400 inches.

PLYMOUTH.—The Plymouth Consolidated mines are employing a large force of men with plenty of ore in sight.

A. White and partner have good prospects of making a big strike in their pocket diggings.

SUTTER CREEK.—Cor. *Ledger*: The mining outlook is improving but little. A determined effort is being made by a few of the creditors to bring the difficulties of the Mahoney to satisfactory adjustment. The Eureka is said to be improving; the rock is reported of better quality; 20 stamps are kept running. D. T. Davies, Supt. of the Eureka or Amador Con. mine, has resigned his position,

AMADOR CITY.—The Bunker Hill will run the mill to its full capacity as soon as the requisite supply of water can be had. The South Spring Hill continues to look well. A large force of men are at work getting the mill in working order, and making a grade from the mine to the mill. The Keystone Company have commenced sinking in the north shaft. The intention is to sink 260 ft, which will give a total depth of 1250 ft.

CON. AMADOR.—*Dispatch*, Nov. 24: We learn that a large body of very rich ore has been struck in the 1200-foot level of the Consolidated Amador mine at Sutter Creek. This will probably have the effect of livening up that town.

A MINE FOR SALE.—The Wetzlar mine, in Murphy's Gulch, near the celebrated Mammoth mine, is advertised for sale on easy terms. We have no doubt that any one who has means will find this a paying investment.

ST. JULIEN.—*Sentinel*, Nov. 21: J. C. McNamara has taken a contract to run a tunnel 70 ft on the St. Julien quartz claim. It is expected to tap the shaft where $20,000 was taken out twenty-five years ago.

Calaveras.

FRENCH CAMP.—*Mountain Echo*, Nov. 21: Messrs. Hix and Owenby, who have been for some weeks past working a quartz claim at French Camp, situated about five miles northeast of this town, came upon a deposit of gold last week, from which they took 15 ounces in two pans. This mine is known as the Gamblin mine, a miner of that name having worked it for a number of years. Mr. Gamblin realized over $20,000 from the mine.

The Oro Plata mill and Chlorine works will be running in full blast this week.

SHEEP RANCH.—*Citizen*, Nov. 24: Cave City promises to become an enterprising section. The recent sale of the Andrews and Harrington claim will undoubtedly be the means of more than one mine in that section to be opened up and thoroughly prospected. Wheelock & Rodgers it is said have excellent mining property near at hand.

El Dorado.

NOTES.—Cor. of Placerville *Republican*, Nov. 22: Whimtown is below par at present, due to several mines closing down for the winter. Graham Bros. are still working their mine with satisfactory results. The Springfield mine is in full blast sinking a new shaft; it is one of the best mines in the county. I met Mr. F. Wentz, one of the foremen of the Pleasant Valley mine, a few days ago, and asked him if the current report about the big strike in the mine was true. He said, while it was not so much as reported it was never in as good a paying condition as at present. I am of the opinion that this county is on the threshold of a great advance.

Inyo.

CHRYSOPOLIS.—*Independent*, Nov. 17: The Maxim Mill and Mining Co. of New York, with Barrie as superintendent, seems to be pushing things with vim on their lately acquired property in the old Chrysopolis district. The grading for the new mill is completed, the frame-work is up, and the rock-breaker in position. The rest of the machinery has been shipped from New York. About 20 tons of ore, running from $40 to $60 per ton in gold, has been extracted from the Arastra and Hope mines, and placed on the mill dump. Some work is being done in the tunnel towards tapping the ledge in the old Chase mine.

RUSS DISTRICT.—Thomas Kehoe is doing assessment work on his mines in Russ district. The ore on the dump is free-milling, and will assay about $40 per ton. The ledge is well defined and shows the entire 1,500 ft. Tom has worked this property for 16 years past, and is entitled to credit for the pluck shown in holding his grip so long.

Mariposa.

DILTZ.—*Gazette*, Nov. 24: Work has recommenced on the south bank of the mine, which has a face of 50 ft perpendicular by 150 ft across, in which is exposed decomposed matter carrying gold in quantities sufficient to justify the outlay of labor and money. The hard quartz is piled for milling purposes; the dirt and decomposed matter is placed at the head of the sluices, into which it will be dumped as soon as the rains come. This embankment has heretofore produced several rich bonanzas, one of which amounted to 36 pounds of pure gold, taken out by Captain Diltz, who was working alone, in about two weeks' time. Captain Diltz is contemplating the erection of a ten-stamp mill at the junction of Sherlock and Whitlock creeks, which is close to his mine, and equally to the Whitlock and Higman mines, under his control. The last rock crushed at the Higman, a number of years ago, yielded $40 a ton, and at the Whitlock from $15 to $30. During the past two years and a half Captain Diltz has been delayed in his work by pending negotiations with Eastern capitalists; but they have failed to meet their engagements, and now the Captain has concluded that he will waste no more time or money in negotiations, but will work his own mine to the best advantage.

BUENA VISTA.—A boiler, engine and stamps passed up to the mine on Wednesday. A ten-stamp steam-power quartz-crushing mill will soon be in place, and a favorable yield of gold from the Buena Vista will be reported semi-monthly and perhaps oftener. The gold-bearing rock is there.

HORNITOS.—Cor. *Herald*, Nov. 23: The famous Duncan mine, from which so many thousands have been taken out in the past, is again being operated. The parties who have leased the mine are all competent miners. They have hoisting works and a steam pump in running order.

The mill at the Number Nine mine is temporarily idle—undergoing repairs. The mines all look well.

Mono.

NOTES.—Homer *Index*, Nov. 24: Work in the May Lundy mine is being prosecuted with vigor, all the stopes are yielding fine ore, immense quantities of which are being accumulated at the mill. The assessment work has been completed on the Rocky Point mine, situated a short distance southwest of the May Lundy, and the 30 ft tunnel shows a 4 ft ledge of fine ore.

A BIG MINING SALE. — The Noonday, North Noonday and Red Cloud Con. mines at Bodie, together with all property affixed, were sold by auction on Monday last by the assignee in insolvency. The whole property was knocked down at $250, subject to liens aggregating $528,000.74, to A. E. Davis, of San Francisco, President of the South Pacific Coast Railroad.

ROCKY POINT AND GOLD BAND.—These 2 prominent locations in Lake Canyon, just south of and above the May Lundy, are making a good showing. They are principally owned by James Monahan and Thomas Brannan, who have had considerable work done on them. Paul Rhoze worked 10 tons of ore from the Gold Band this summer, in his arastra, and pronounced it pretty good rock, even for Mill creek. The immense ore channel is undoubtedly rich from the Gorilla to the Bryant.

Nevada.

MURCHIE.—*Transcript*, Nov. 24: The ten stamp mill at the Murchie is run continuously on rock from the principal ledge, which is being worked as deep as 700 ft. The eight stamp mill is used in crushing rock from other ledges that the company is prospecting. An experienced mining man who recently visited the property says that the company will soon require additional milling facilities. The claim consists of 500 acres of land containing five developed ledges.

CENTENNIAL.—*Transcript*, Nov. 22: Supt. Baker was down yesterday from the Centennial mine in Washington township. The new pump was started Tuesday, but did not raise the water well. Shortly after his arrival he got a telephone message that it had stopped "bucking," and was working finely. Eight men are now employed in putting the shaft down to bedrock.

MERRIFIELD.—The Merrifield mill began crushing Tuesday. Work will be pushed in all parts of the mine as fast as practicable, the force of miners being increased from time to time until the full quota is again "on deck."

CANADA HILL.—*Tri-Weekly Herald*, Nov. 24: Considerable quartz mining is being done in the district and the prospects are encouraging. Excellent ore is being taken from the Charonnat mine, the clean-up from one week's run of the mill recently being sufficient to pay a full month's expenses. In a short time the machinery will be running by water-power. Chris. Weisenburger and Artbur O'Hearn have entered into a contract with the Charonnat Company to take out 100 tons of quartz from a ledge near the Charonnat. They have struck some very fine looking rock. Samuel Barr is working a ledge that prospects well. Lately a streak of very rich ore was met with, which increases as work progresses.

Placer.

RIVER MINING.—*Argus*, Nov. 22: Our friend Boles, who is mining in the bed of the American River near Rattlesnake Bar, is getting a little anxious about the weather. A fortnight or so more of fine weather would be worth thousands of dollars to him. He has had a large number of men at work for over 2 months past damming and fluming and doing other necessary work, preparatory to getting down into the crevices and rich pockets on the bed of the river. This work could not be done before a certain date, rather late in the season, when the water is pretty low down, and then every thing has to be done in a hurry. Should the rains come now before Mr. Boles has had a chance to clean up, his work would be all in vain, as it would sweep his improvements away and leave him about $4,000 out of pocket. Two or three years ago his first day's clean-up was no less than $3,000. Last year and the year before he was washed out.

Plumas.

INDIAN VALLEY.—Greenville *Bulletin*, Nov. 21: All the miners at the Indian Valley were stopped from work on Monday. The flow of water in the bottom of the shaft had increased so much that it could not be kept down by bailing with buckets, and at present no other means are available. The bottom of the shaft is in much better ore than any before found in the mine. The mill will be stopped by Friday. It is not known how long operations will be suspended, but in all probability as soon as water for power is supplied work will be resumed.

ELIZABETHTOWN.—Loring and Leavitt are reported to be taking out from $200 to $400 per day to the pick in their claim at Elizabethtown. They are working on the lower end of the claim, next to the ground now being prospected by Russel and Davis on the O'Neil ranch.

RUSH CREEK.—During the past thirteen years John Martin has been prospecting at the head of Rush Creek from time to time. He has put down several shafts to a depth of about 160 ft average, and is now running a tunnel that will cut two quartz ledges that crop out higher up the mountain, though his main object is to strike the old gravel channel. The ground looks well.

SOUTHERN EUREKA.—At the Southern Eureka it is expected the mill will be started up next Monday. J. W. McCartney is now at work getting the mill in complete order, and T. J. Hanson is putting to rights the engine and boiler. From present appearance a successful run may be expected.

San Bernardino.

IVANPAH.—*Index*, Nov. 24: J. A. Bidwell, of Ivanpah, called at this office last evening, and was interviewed as to the prospects of the mines at Ivanpah. The principal of the group of mines at Ivanpah is the Lizzie Bullock, of which Mr. Bidwell is the owner. He has employed 13 men on this mine and in his mill, and the mill is kept running with the ore from his own mine, and the old Consolidated, Alps, Eugene and Stonewall mines, all of which are being worked. Mr. Bidwell has an 8-mule team constantly hauling supplies from Fenner station on the railroad 70 miles distant. He reports that all the mines are looking well. In his own mine, the Lizzie Bullock, he has just struck the main ledge at a depth of 315 ft. It has taken over ten years to work about 300 ft square, and this latest strike places at his disposal more than twice the amount of the same rich ground, and the bottom is not yet reached. Two hundred ft below the 315 ft level he has a good body of ore.

CALICO NOTES.—*Print*, Nov. 24: On the Sue, J. B. Osborne has three men at work who have a contract to run a tunnel 50 ft at $8 per foot. They are now in 40 ft. There are also two men at work sinking a shaft at the bottom of the gulch for water. They are down 15 ft, at which depth the gravel is becoming wet. The Josephine, owned by Fay and Lawrence, of the Toll Gate, leased by Soule and Stevens, has two men at work running a tunnel in the ledge. They are in 15 ft. The Mountain Brow, owned by Sparkule, has three men at work. At the Red Jacket there are six men at work under J. B. Ferrell. They are working in the tunnel connecting with the shaft above the Mammoth. Two men are working on the Silver Odessa, and are finding some good ore which is being sacked for shipment to the Alhambra mill at Hawley's station. The usual men are at work at the Garfield, Runover, Bismarck, Humbug and the King, and Calico mining district altogether has better promise to-day than ever before

Sierra.

FLORENCE.—*Tribune*, Nov. 22: This claim is 2 miles west of the famous Keystone mine, on the ridge above Sierra City. The Florence ledge was worked to some extent 20 years ago, and ore was worked in an arastra that yielded as high as $70 per ton. At present there is a 4-stamp mill on the property. A tunnel has been run that will tap the ledge 200 ft below the surface when the pay chimney is reached. The ledge will average 4 ft in width and is a true fissure vein. The owners are Wilcox, Mooney & Hutchinson, of Sierra City, and S. R. Stephenson, of Forest City. The latter gentleman was in San Francisco a short time ago, and bonded the mine to ex-Lieutenant Governor Johnson until the 1st of January.

RUBY.—Supt. Coleman was over from the Ruby mine last Friday and reported the following: The incline is down 12 ft below the main tunnel and in splendid paying wash gravel. The working force will be increased to 20 men next week, and the week after 2 gangways will be started on the channel. Mr. Coleman feels highly elated over the encouraging developments.

WISCONSIN EXTENSION.—P. Grant, one of the owners in the Wisconsin Extension gravel mine, informs us that softer rock has been encountered in the upraise, about 20 ft out from the face of the main tunnel. The Wisconsin tunnel has been run in a distance of 2,200 ft, through hard rock, at a cost of $56,000. The entire work has been wholly of a prospective character, and has been carried on by comparatively poor men.

NOTES.—James Nelson is putting things in shape to start up work at the Tippecanoe mine, near Pike City, as soon as water comes. It is expected that the mine will yield handsomely this season. The usual force of men are being employed in the Bald Mountain mine. At the Honeycomb quartz mine, near Camptonville, Messrs. Arnold & Ogden are preparing to resume work with an arastra. There has been considerable work done on this mine in years past; but it was done in a desultory manner, and the real merits of the ledge have never been tested. If the developments made are sufficient to warrant it, a mill will be erected in the spring.

Siskiyou.

DEADWOOD.—Cor. Yreka *Union*, Nov. 22: Every thing looks flattering for this section of the country. Warnaka & Co.'s arastra started up 1 week ago on ore from the Little Willie mine. This mine is owned by Messrs. Warnaka, Nason & Fyfield, and is the oldest location in the district. Ore from the mine has worked as high as $40 to the ton. The mine is stripped on the surface for a distance of 250 ft, showing a continuous vein from 1 to 2 ft in thickness, and free gold can be seen in nearly all the ore. Tunnels have been run into the mountain a distance of 50 ft, cross-cutting the vein, and the owners estimate 1,000 tons of ore in sight. Pyle & Co., on the East Fork, have 1 mile of ditch completed, a nice house built, an arastra fast approaching completion, and they expect to be crushing ore within 2 weeks. Mr. Thomas is working his placer mine on McAdams Creek with good success, running only a day force. Both shafts on the Oak Grove claim are paying better than for several months past. This mine is owned by Lincoln & Co., and they employ a force of 25 men. On Indian Creek the quartz mines are paying well. The Grizzly have taken out some very rich rock within the last week.

Trinity.

WILLSHIRE MINE.—*Journal*, Nov. 24: Eddie Wallace was up from Big Bar this week, and informed us that his father has completed preparations for working the Willshire mine. It is probable they will not have to wait long for water.

Tuolumne.

THE MOTHER LODE.—Sonora *Democrat*, Nov. 24: The section of the mother lode beginning at Rawhide and running below Jamestown to the bank of Woods' Creek can every foot of it be profitably mined. For several miles the lode averages 60 ft in width, and the rock will yield in the mill, worked in bulk, from $3 to $6 per ton; and anywhere in this section the rock can be mined and milled at an expense of a dollar a ton or less. The only man in Tuolumne County who has furnished a practical example of what can be done in mining the slates to the east of the mother vein is W. N. Harris, of Jamestown. A little more than 3 years ago he bought the Alabama mine, and erected a 40-stamp mill on it. With this mill he is able to mill and mine 80 tons of ore every 24 hours with a force of 12 men. The total expense involved in extracting and crushing is less than $1 per ton. The actual results have been a yield of from $2.50 to $3.75 per ton. To accomplish his success Mr. Harris had his mill constructed with an especial view to saving all the labor possible. Nothing that can be done by machinery is done by hand. The power for the mill is furnished by a Knight water wheel, which is run by water bought from the Tuolumne Water Co. Water costs $23 per day. This amount is included in the stated expense of milling and mining. Although $3 per ton looks almost like nothing, it does not demand any great intelligence to perceive that a practically inexhaustible deposit of $3-ore which can be worked at an expense of $1 per ton is a magnificent bonanza. The men who will mine the mother lode must construct a complete system of reservoirs and ditches, so as to obtain an unlimited and never-failing supply of water power.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Nov. 24: Some good ore has been developed in the north branch drift on the 2700 level. There has been no increase of water, though care has been taken not to cut across the stratification. The drifts from the F street tunnel are making fair progress north and south.

UNION CON.—The south drift from the 3100 station is passing through streaks of good ore alternating with seams of stained quartz (highly silicified porphyry) of no value. The drift has not yet reached the main ore streaks cut through in sinking the winze. The double cages have been put into the joint winze.

IMPERIAL.—The west drift from the 600 station is being pushed as rapidly as possible for the works in the old upper level. Once this drift has reached its objective point, explorations will be commenced in the old ground of the Alpha, Exchequer and Imperial.

ALTA.—All in the works and shaft is now in first-class order. The 2150 level will be drained in a few days, when it will not be long before active prospecting operations may be resumed.

GOULD AND CURRY.—The joint Best and Belcher winze that is being sunk below the 2500 level is down about 75 ft. The ground has been of a soft and swelling character, but is now harder. The bottom is now in quartz of a fine appearance, but as yet it carries no metal.

SIERRA NEVADA.—The upraise from the 2900 level is being advanced at the rate of about 15 ft per week, in dry and favorable ground. On the 3100 level a north drift will be started in a few days from the joint Union Con. station at that point.

BEST AND BELCHER.—The joint Gould and Curry winze is being sunk and timbered at the rate of about 15 ft per week. It is now about 75 ft deep. The ground has been soft, but is now showing quartz of good appearance.

COMBINATION SHAFT.—The new hydraulic pump is completed, and as soon as it is tested it will be shipped to this city. All here is in readiness to receive the pump, which can be set up in 10 days after arrival.

MEXICAN.—The north drift on the 3100 level will probably reach the Union Con. line to-day. When it reaches the line the Union Con. Co. will pay for its further advancement.

CROWN POINT.—About the usual quantity of ore is being extracted and shipped to the mills on the river. Some work is being done in the way of exploring for new deposits of ore at various points.

ANDES.—The face of the north drift still continues in quartz of a promising appearance. The south drift from the winze is in quartz that gives promise of ore.

BELCHER.—Some ore is being extracted, and the amount will be gradually increased as additional stamps are put in operation in the mills on the Carson River.

CALIFORNIA.—The joint Con. Virginia winze on the 2700 level is being sunk and timbered at the rate of about 12 ft per week.

CON. VIRGINIA.—On the 2700 level the joint California winze is being sunk and timbered at the rate of from 10 to 12 ft per week.

YELLOW JACKET.—About 100 tons of ore per day are being extracted, and a good deal of work in the way of exploration is being done.

UTAH.—Good progress is making in the work of retimbering and repairing the main incline below the 1350 level.

OPHIR.—Are still extracting some low-grade ore from the 150 level. It is nearly all in the shape of old fillings.

UNION SHAFT.—The work of cutting out behind and easing timbers at the 2300 station is still continued.

OVERMAN.—Some low-grade ore is still being extracted from the old upper levels.

SCORPION.—The west drift on the 500 level is still being advanced.

Belmont District.

BELMONT MINE.—*Courier*, Nov. 17: The Belmont mine is still looking splendid, and the work of development is pushed ahead with energy. The following is a copy of the superintendent's letter of November 17: "All stopes in south tunnel are yielding an abundance of good ore. No. 1 level in Laity ground has been extended south during the week in the gouge 20 ft. Winze No. 1 south of Highbridge shaft is now down 40 ft; ledge somewhat broken. We are opening a new level in Moore and Martin ground, now down 40 ft. The stope in this ground is looking well. The mill is working 24 tons per day, and is doing splendid work.

NOTES.—We learn that the Tybo mill will again start up as soon as repairs are completed. The working force in the 2-G mine has been reduced, and it is said that the work of development will be performed by contractors next winter. Garrard, Robinson and Wilson are preparing to run a tunnel in their mine at Jefferson. The prospects are good for striking pay ore. Work in the Seventy-seven mine is progressing as usual. The Belmont Mining Co. is now shipping bullion. Green Aldrich will soon have the Emerson mill and leaching works running in full blast. Charles Kanrohat is still working his mine at Jefferson with flattering results.

Esmeralda District.

MT. CORY.—Hawthorne *Herald*, Nov. 17: Nothing new has transpired at the Mount Cory mine or mill since our last issue. The heaviest machinery is now arriving.

AURORA.—John and Horace Poor and George D. Clark are having the ore from the H. V. Poor mine

worked at the Silver Hill mill, and John Neidy is superintending the crushing. Handsome returns are expected.

Paradise District.

PARADISE BULLION.—*Silver State*, Nov. 21: J. V. McCurdy shipped from the Paradise Valley mill, yesterday, 1 bar of bullion of the assayed value of $2,555.18. It was almost pure silver, and was one of the handsomest bars ever shipped from the Paradise mines

Peavine District.

GOLDEN FLEECE.—Reno *Gazette*, Nov. 20: The Golden Fleece Mining Co. started work on their property at Peavine last week. They have encountered a new character of ore. It is of a greenish color, resembling the J. & K. rock at Pyramid. General Clark visited the mine yesterday, and was well pleased. The body of ore in the "new find" is inexhaustible. The miners have also encountered a large body of water. Work has also been commenced on the Poe. The two men struck a seam, which they followed up 15 ft, when it widened out to 2 ft, the bottom and sides of the drift being in good ore.

Ploche District.

CHIEF.—*Record*, Nov. 17: There were recently 5½ tons of ore around the old mine dumps in Chief district, and sent to the Dry Valley mill to test. The ore went $35 in silver and $33 in gold; total $68. Ore gathered up at the old dumps of this now abandoned district, about a year ago, went about the same as this last lot. The gold can not be extracted by mill process, but by chloridizing and roasting it may be extracted. The ore in Chief district will average $20 or more in gold. The contemplated railroad through this county will run right by this district.

COMET.—The boys at Comet district continue shipping in small lots of rich ore. Those who have worked their claims in this way have been able to keep working and paying expenses as they went along.

INDIAN.—The work at Indian district has ceased for the winter. There has been a few tons of ore that will work $150 per ton sacked, and it will be brought into Bristol.

MENDHA.—There is some very rich ore being extracted from the Mendha mine at Highland. Teams have hauled considerable ore to the furnace within the last few days.

DAY.—Teams are hauling ore from the Day mine to the furnace at Bristol, but the furnace will not start up till there is a large quantity of ore and flux at hand. Supt. Grim is pushing matters as rapidly as convenience will permit, but it will probably be some little while yet till the furnace is started.

KINGFISHER.—The Kingfisher claim has greatly improved the last week. The men engaged in running on the tunnel level recently encountered a ledge of solid ore of a dark carbonate. The assay from the sample sent to town went $171 in silver and 25 per cent lead.

Pyramid District.

PYRAMID MINE.—Reno *Gazette*, Nov. 21: This is the coming camp. The ore goes $200 per ton in copper and silver besides sulphur. The papers reported that it went $400 the other day, but it had not been assayed then. It is like the ore near Smartsville, California, except that it contains silver and is richer in copper. It can be worked for $25 or $30 a ton if suitable works are erected, which Mr. Kinkead thinks will not cost over $10,000 to build. The freight to Denver is $40 a ton, so that a very few car-loads would buy the furnace and build the works.

Tuscarora District.

ELKO CON.—*Times-Review*, Nov. 15: Since last report the station at the 200 level of shaft No. 2 has been completed. Will extend the shaft a few feet for a sump, after which will immediately commence crosscutting.

ARGENTA.—North cross-cut, 400 level, is in 198 ft; progress for the week, 15 ft. The ground is looking more favorable.

GRAND PRIZE.—The raise above the 400 is up 82 ft and in good ore. Stopes above the 300 producing usual amount of ore. South drift on 400 level is in 114 ft; progress during the week, 24 ft. Ledge is large in face of drift. Mill was started Monday morning and is working very well. Pulp assays so far have averaged $224 per ton.

BELLE ISLE.—*Inter-Mountain*, Nov. 6: North drift, 450 level, has been extended 21 ft. Upraise, 350 level, has been carried up a total distance of 43 ft.

NAVAJO.—Started to milling yesterday. Everything at mine and mill running smoothly. Stopes on the different levels are making the usual output of ore.

INDEPENDENCE.—Total length of No. 1 cross-cut, 300 level, 83 ft. Progress 21 ft. Cross-cut No. 2 has been extended 14 ft; total length 48 ft. No. 3 has been advanced 23 ft. Progress 11 ft. Main drift north has been extended 6 ft; total length 891 ft.

NORTH BELLE ISLE.—Good progress has been made in cutting out station at top of upraise at the connection with Belle Isle. This work will be completed and timbered in a few days. Then the outlet will be through this connection to the Navajo shaft, and the expense of running the upper works will cease. The siphon to drain this level works successfully. Will commence sending ore to the mill within the next 10 days.

White Pine District.

NOTES.—White Pine *News*, Nov. 17: The Smoky mill suddenly shut down Friday evening, cleaned up Saturday, and we are not likely to hear its whistle again till spring. Col. Grandelmyer, with the force in his employ, are doing assessment on various claims. The Colonel devotes all his time to superintending the work.

ARIZONA.

TIPTOP.—Prescott *Miner*, Nov. 16: An attachment has been placed on the Tiptop mine and mill for $1,000, with interest at 9 per cent per annum, from Oct. 23, 1883, in favor of Samuel Goldwater, of this place. So far no attempt has been made by the company to settle it, from which it is to be inferred that the property is to be abandoned.

GROOM CREEK.—The parties who have been sinking 100 additional ft on the Chicago mine have completed their contract, and the company is now running levels—working three shifts constantly. The mill will be started up on Tuesday, and kept constantly running.

MORE FROM GROOM CREEK.—A. J. Rupert yesterday showed us some specimens of free-milling gold quartz carrying a large amount of gold. The samples came from his claim on Groom Creek. The first discovery is called the Flora, while the extension is called the Lincoln. Mr. R. also owns an eighth interest in the Golden Chariot, near by, a gold mine with a vein not quite so wide as the Flora, but carrying very rich ore.

GIPSY.—Globe *Chronicle*, Nov. 17: The outlook for the Gipsy mine is very promising. A shaft down 105 ft seems to have struck the northeast point of a large chimney of high-grade ore. Drift No. 1 at the 30 level, running in a southwest direction, is now in 15 ft; Drift No. 2 at the 105 level shows even a stronger vein. The entire workings show a strong vein of rich milling ore. At present this is one of the most promising prospects in the district.

OWL HEAD.—Pinal *Drill*, Nov. 17: The Owl Head mines under D. T. Elmore are under full headway. There is a large body of excellent ore in sight, and every thing indicates prosperity beneath the Owl Heads.

CONCORD.—Judge Taft has struck very good-looking quartz on the Concord. The ledge was struck at a depth of 100 ft, is 4 ft wide, and looks well.

PROMISING.—Above the King, along the line of the lower edge of the first lime belt, there are several highly promising mines; we spent a day amongst these hills. The furthest mine on the belt is the Surpriser. The ore is all of the same class, block galena carrying silver and apparently some zinc, and is very rich. There are several quite large dumps of ore.

TOMBSTONE.—*Epitaph*, Nov. 18: A very important strike occurred in the Mammoth mine during the last week. The main incline shaft is down 270 ft, and at this depth the new ore-body was encountered. The ore is higher in grade than any encountered in this mine before.

GIRARD.—A small force of men is cleaning up the dumps and getting the ore ready to be shipped to the Boston mill. The mine will be shut down for the present. Mr. Fee, the superintendent, assures us that the mine is in splendid condition, and plenty of ore in sight ready to be taken out.

COLORADO.

EMPIRE.—Georgetown *Courier*, Nov. 15: We learn that the old Jones or Knickerboeker mill will soon be started up again. The dam will be repaired, and a new wheel and works throughout put in, with 20 stamps and a concentrator attached. They have one of the best gold lodes in the country, the Tenth Legion, a lode we worked nearly two years, and know whereof we speak. This mill was built 20 years ago, by G. W. Hall, for John S. Jones, and has always paid up to the time the dam washed out, two years ago. It is one of the finest water-powers in the country, and able to run 40 stamps day and night. 20 stamps will crush from 1½ to 2 cords of ore every 24 hours, or from 11 to 15 tons every 24 hours. Two men can run it at a cost of one dollar per ton.

NEW YORK AND COLORADO CO.—The New York and Colorado Co. are building one of the finest mills ever built in the State. It has the best machinery I have ever seen in Colorado. Every thing is being done in the most substantial manner. The mill building is large and well put up. The engine is a Corliss of 75-horse power, with two boilers of 40-horse-power each. It has 50 stamps, with 10 Frue vanners for concentrating the ore.

SEVEN-THIRTY MINE.—This property continues to ship high-grade ore. The shipments of the 1st, 2d and 3d of this month amounted to $2,200, the first-class ore milling 808 ozs. silver per ton, and the second-class from 107 to 209 ozs. Between 40 and 50 men are employed, and new ground is daily opened. Five drifts are at present being run—three on the west and two on the east of the main shaft. All are in mineral.

SILVER PLUME.—*Gazette*, Nov. 17: In the Baltimore tunnel the Co. is sinking a pump in the lowest level to collect the water, and as soon as this is completed a party of lessees will commence sinking the Baltimore shaft to a depth of 60 ft, from which they will drift east and west. There is a streak of 2 to 3 inches of 500 to 700 oz. ore in the shaft to commence on.

HUBERT MINE.—*Miner*, Nov. 17: Three men extracted last week, in the Hubert workings, twenty tons of smelting ore, averaging about $60 a ton, and about 60 tons of milling ore averaging from 4 to 5 ozs. per cord in gold. This lode was discovered in 1862, and the surface worked by prospectors with large returns. It has lain idle, however, for many years, owing to lack of finances on the part of the owners.

RICH ORE.—The Boulder *News and Courier* says that Emmet Rea has been working in the Senator Hill mine at Magnolia, and last week shipped, aside from a quantity of other ore, several pounds of first-class ore which runs 1,200 ozs. of gold or $24,000 per ton.

IDAHO.

ATLANTA.—*World*, Nov. 16: J. D. Heath came down from Atlanta last week for the winter. His latest strike is in the Washington lode, and bids fair to excel all others he has had a hand in developing. During the past summer he has driven a 284 ft tunnel, and about the 1st instant crosscut a 4 ft vein of exceedingly high grade ore. Mr. Heath has in his possession specimens worth $1 per pound, and it is known that the entire ledge will return a yield of several hundred dollars per ton. The ledge was tapped at a depth of 150 ft from the surface.

BANNER.—The stamps of the Banner ceased to drop Wednesday morning, but the "clean-up" will occupy several days. Until then the exact product of the 4 months' work can not be learned, but it will be near $120,000. Operations in the mine will be continued all winter.

MERRIMAC.—Wood River *Times*, Nov. 14: Capt. Stowe has come down from the Merrimae mine, on Lake Creek. He reports the ore vein 3½ ft wide, of good ore, but does not know how wide the ledge is. There being 2½ ft of snow at the mine, on a level, work has been discontinued for the present. It will be resumed in the spring.

BLACK HORSE MINE.—Ketchum *Keystone*, Nov. 14: Mr. Floyd, the superintendent, says that the Black Horse never presented a better appearance than at present. A fine body of ore 70 ft long is developed in the main tunnel. The first-class ore runs as high as 130 ounces in silver and 66 per cent lead, value, $175, in 20-ton lots. The second-class assays 57 in silver and 37 in lead. The shipment of ore continues to the smelter, and will not cease till roads are impassable. Winter supplies have been shipped to the mine.

BAYHORSE.—Ketchum *Keystone*, Nov. 17: Seventy-five miners on the Ramshorn mine at Bayhorse were recently discharged because of too abundant yield for the smelter. Sufficient ore is now on the dumps to run the smelter another month, at the end of which time it will close for the winter. The Ramshorn smelter consists of two 50-ton stacks, which have been in operation during the greater part of the summer and fall. The Ramshorn ore is very high grade, assaying from 200 to 300 ounces in silver with a good per cent of lead per ton. The bullion yield of the smelters has probably averaged about 15 tons daily for several months past.

MULDOON.—A force of 15 men was recently put to work on the Muldoon mine, and winter's supplies laid in. In the lower works remarkably rich carbonates have been struck containing sufficient iron to make the ore very free smelting. It assays 125.5 ounces in silver and 37 per cent lead.

MONTANA.

CATARACT DISTRICT.—*Inter-Mountian*, Nov. 16: Foster & Harper are the owners of 3 leads—the Boston, Buckeye and Wolverine. Assays from the float at the Buckeye give a return of 70 ounces. The lead is opened by a shaft 23 ft deep, and a tunnel being run to tap the vein at a depth of 50 ft is in 70 ft. It is thought the tunnel will reach the main ore body in 50 ft more. The Boston has been sunk on 36 ft and assays from the bottom give 65 ounces silver and $12 in gold. A tunnel has been started, which will tap the lead at 75 ft, and will have to be run about 80 ft. A water diteh near the mouth of the shaft keeps it full of water. The Wolverine has a 20 ft shaft and assays 40 ounces. The district is 25 miles from Butte. The location of the mines is like those of the Summit Valley. Any property in the district can be approached in a buggy. The Cataract district is 3 miles west of Comet, Jefferson County.

SHONBAR.—*Inter-Mountain*, Nov. 17: Joe Lacaff is jubilant in consequence of an important development in the Shonbar. The shaft was recently sunk to the 300 ft station. Since then a drift has been extended east on the vein 150 ft, following a body of ore 4 ft wide and assaying $35 per ton. A few days ago a body of tale was penetrated, and extension a few feet further disclosed the west extremity of what is evidently a very much richer shoot of ore, and which, it will be remembered, was opened in the 220 level, for a length of 200 ft, with splendid results. The new strike is 3 ft wide and samples $100. It can be sorted, however, up to the value of $325. The company is now working 14 men, has 2,000 tons of $40 ore on the dump, has produced $100,000 in the last 15 months, and has a complete hoisting and pumping plant.

MOUNTAIN VIEW.—Chas. N. Larabie is now in a fair way to open up one of the biggest copper mines in Butte, a mine which there is little doubt is an extension of the famous Anaconda. Already it is stated the workmen in the St. Lawrence can hear the blasts in the Mountain View. Mr. Larabie has spent a great many thousand dollars on the Mountain View, against the advice of some of his friends. He has sunk a shaft 500 ft deep, and lately has struck a fine grade of copper ore in the south 300 ft cross cut.

NEW MEXICO.

CARLISLE.—Southwest *Sentinel*, Nov. 14: The Carlisle is the biggest mine yet discovered in Southern New Mexico. The ore which is now being extracted comes from an open eut on the surface. We are informed that this eut now shows a breast of ore 50 ft from top to bottom, and 30 ft or more in width, all of which pays well. This is certainly a phenomenal body of ore, and not equaled by any other property in Grant County. Aside from this vast ore-body, the mine is opened to a depth of 300 ft, where it shows equally as well as on the surface. The ore here is not only rich in gold but also in silver. The regular product of the mill is nearly $40,000 per month, and yet the mill is only run to half its eapacity, the supply of water being short.

FLEMING.—Jack Fleming expects to make a clean-up the latter part of the week. He estimates the produet of the run so far, which does not exceed three weeks, at from $8,000 to $10,000.

The Southwest *Sentinel* of the 17th says: The Fleming mill has never stopped once since it was started up, and is crushing daily 18 to 20 tons of ore. The work of cleaning up the pans has been going on for several days, and several hundred pounds of amalgam have been obtained. Retorting will begin to-night.

TELEGRAPH DISTRICT.—Crawford, Bradley & Co. are now the sole owners of nearly all the important properties in Telegraph district. The Mother lode is probably the best mine in the group, and at the bottom of the 170 incline the vein is 5 ft in width, and is yielding 40-ounce ore. From one of these mines two men recently took out 8 tons of 300-ounce ore within a week's time.

NEW YORK AND NEW MEXICO CO.—Silver City *Enterprise*, Nov. 16: The mines adjoining the Bremer, on which Colonel Waller contemplated such extensive operations previous to his death, are to be opened up by the New York and New Mexico Mining Co., represented here by Mr. D. McDonald. The company have 4 claims which are on the same contact as those upon which Mr. Bremer is working, and which have produced so handsomely during the past year. Hoisting machinery is being erected preparatory to continuing sinking on the shaft of the Hidden Treasure which has attained a depth of 100 ft.

CEDAR GROVE.—The Red Warrior, Cedar Grove and Viola are owned by C. C. Clark, H. Gudgeon and P. Gunning. They make up the group upon which most of the work has been done, and are now being actively developed. The Red Warrior is opened with a 15 ft shaft on the vein showing ore in an 18 inch streak, the vein being much wider. Other surface openings show the ore and vein to be continuous. The Viola has a 60 ft shaft which, at a depth of 12 ft from the surface leaves the ore, the latter pitching easterly. A quantity of high-grade ore has come out of the shaft, chloride and sulphide of silver showing in much of it. A lot of unassorted ore from there, shipped away for the purpose of having an average run made, gave returns at the rate of $300 per ton.

OREGON.

NOTES.—Jacksonville *Times*, Nov. 16: William Scott of Gall's Creek informs us that the miners of that section are all ready for water. McCall & Anderson have purchased S. Dale's mines, on the east side of Bear Creek, and put some hydraulic pipe on them. Huston & Hosmer of Foot's creek are making extensive preparations, and propose putting a giant and plenty of pipe on their claims. Miller & Kretzer, who have large mining interests on Farmer's Flat, are ready to commence piping. They will operate on an extensive scale. Jack Layton was in town this week. He has been piping some, but water is yet too scarce to mine advantageously. A Waldo correspondent says: Wimer & Sons will commence piping with 2 pipes in a few days. Simmons, Ennis & Co. are pushing along rapidly. Bybee & Co. are ready to run, as also are DeSelles & Co.

UTAH.

OSCEOLA.—Cor. Southern Utah *Times*, Nov. 17: The Osceola Co. are getting along finely. Their 20 stamp mill is nearly completed and will commence crushing ore before the first of December. The company's property consists of 2 mines, the Credit Mobilier and Fort Wayne. The Credit Mobilier has 3 parallel and distinct ledges cropping out upon the surface. The lower ledge, where the hoisting works are ereeted, has a shaft upon it 235 ft deep. At that depth the ledge is 5½ ft wide, free gold quartz. At a depth of 200 ft a drift has been run which euts the middle ledge 90 ft from the main shaft. This middle ledge is 7 ft wide and is good ore, some of it working as high as $500 per ton mill process. The third ledge is further up the hill, about 100 ft from the middle ledge, and shows 10 ft in width on the surface. The Fort Wayne is simply immense, the croppings being something over 80 ft wide, with free gold plainly exposed to the naked eye. The company is working 23 miners at present and will increase their force to 50 when the mill begins to crush.

BONDHOLDER.—The Bondholder, owned by Stead & Gregory, is a well defined ledge of 1500 ft, showing from 3 to 7 ft wide of quartz assaying from $6 to $40 per ton.

SILVER KING.—The Silver King is the first northwest extension of the Fort Wayne. It is a large well defined ledge carrying free gold and going high in silver, some of the ore showing horn-silver. The Silver Queen, owned by the same parties, adjoins the Silver King, and shows a well defined ledge of same character of ore.

UINTAH.—Park *Mining Record*, Nov. 17: The Uintah has a number of men at work on their 2 tunnels prospecting and running for the vein. The upper tunnel is now in the foot-wall, and the rock is mineralized heavily. The developments are being made under the direction of W. P. Blaek, who has spent several years in Colorado. He thinks Park City has a brighter outlook as a carbonate camp than Leadville.

CRESCENT.—Park *Mining Record*, Nov. 10: During this year the mine has made a splendid record, as the following figures will show: Receipts—Ore sales, $348,000. Expenditures—Dividends, $150,000; purchase of Walker & Webster, $50,000; permanent improvements and property on hand, $148,000; total, $348,000.

ONTARIO.—The shaft at the No. 3 Ontario works has reached a depth of 855 ft, and the work of cutting the stations is to be commenced at once. There are to be 3 at that level—a pump-bob, tank and working station.

WASHINGTON.

COEUR D'ALENE.—*Oregonian*, Nov. 16: Following are extracts from a letter by O. A. Tibbetts to his brother in Portland: "Pritchard Creek is located for 20 miles, Eagle Creek for 12, and Beaver Creek for 15 miles. When I left, Pritchard Creek was the only one that had been prospected, and that not thoroughly. They were sluicing in four different claims, all averaging over an ounce per day to the man. In one claim five men in three days took out 31½ ounees, and the day I was in the claim they picked up over $30 in nuggets while cleaning the bedrock. At this time they were working over rough bedrock, and in a few days they ran on to smooth bedrock, when seven of them only cleaned up $10. There is no plaee where they go to bedrock on the three creeks but what they find very flattering prospects. The gold is very eoarse, none of it running less than 50 cents, and I saw one piece which went $38.40. They found a piece recently which weighs a trifle over $156, and a large number of nuggets have been found ranging from $6 to $20. When I left the eamp there were about 500 or 600 men on the crecks, and I met 80 on their way in. The eamp has been visited by something over 1500 men, but probably not more than 200 or 300 will winter there. As soon as the spring opens there will be the greatest rush ever known on this north Paeific Coast. I will not be surprised to see 15,000 men on the ground by July 1st. The exeitement amongst old miners is intense, and they are sending for friends far and near, and even should the pay not extend over all the ground the rush will be just as great, for it will not be thoroughly prospected this season. They have located three galena veins running northeast from Beaver Creek, the best of which goes $25 gold, 30 ounces silver and 47 per cent lead; and due east from there they are sinking on a ledge that shows a sampling as high as $900 gold.

The Bedrock *Democrat* of the 15th says: The mines are in Shoshone County, but near the boundary line of Kootenai. This is a very aggravating feature of the situation, for, in order to reach the county seat, Pieree City, to record claims, a journey of 250 miles via Lewiston must be undergone. The mines are about 65 miles north of the old government highway known as the Mullan road, and 45 miles north of the old Cœur d'Alene Mission. This would make it about 70 miles from Rathdrum, and between 90 and 100 miles northeast of Spokane Falls.

Intra-Mercurial Planets.

[Read before the California Academy of Sciences, by GEORGE DAVIDSON, U. S. Coast and Geodetic Survey.]

Truvelot's Red Star.

The scientific journals bring us items from the reports of M. Truvelot, who accompanied Mr. Jannsen to the Caroline Island to observe the total solar eclipse, of May 6th, 1882.

The members of this Academy will recollect that Jannsen and his associates were invited to our meeting. Messrs. Palisa and Tacbini and Rockwell were absent. All these gentlemen had been observers of the eclipse, and some of them bad specially directed their attention to the question of intramercurial planets. No one had seen any sign of these bodies, but M. Truvelot made known to the Academy that at the time of totality he had seen a star—a red star—of the fourth magnitude about three degrees north and three degrees west of the sun, and that the star had no definite disk or appreciable phase. He had had no opportunity to consult star charts, and therefore he could not pronounce judgment upon its being a star or an intramercurial planet.

The next day I placed the sun in its proper position on the star charts of Aydander, and then found *d* Arietis, of the fourth magnitude, situated two and three-fourths degrees north and two and three-fourths degrees west of the sun. I had to be absent during the day, but M. Truvelot came and examined the charts and my location of the sun. To my mind there was the solution of M. Truvelot's red star. But *d* Arietes is not a red star, and we can only suppose that there were such conditions present as gave to the star a reddish hue, or that M. Truvelot sees objects red where other observers do not.

I have been thus particular about details because we now read published statements that are somewhat different. It is mentioned that he saw a decidedly red star "a little to the north and a little to the west of the sun." He, moreover, is reported to have stated (Nature, page 546) that on September 5th and 7th he examined the part of the sky where the sun was then situate, with a telescope of the same aperture that he used in observing the eclipse, and with the eye-piece then employed he recognized the two white stars which he had noted as 41 and *e* Arietis, but the red star was not found, even though he swept to a much greater distance than any probable error of his observation would allow. On this circumstance he remarks:

"As much as the absence of a red star as brilliant as that one which I observed during the eclipse seemed naturally to lead me to suppose that the star in question was not other than an intramercurial planet, nevertheless, as the most necessary elements—such as the position, and a disk, or a sensible phase—failed to my observation, I believe that it is my duty to hold my opinion in reserve, and for the present suspend my conclusions upon the possible nature of this star."

With regard to the reference to the stars 41 Arietis and *e* Arietis, respectively of the 4th and 4½ magnitudes, it need only be remarked that they were not in or near the region of the reported red star. The former star was 10¼ degrees north of the sun and 2½ degrees to the east; the latter star was 4¾ degrees north ½ a degree east of the sun. They may be thrown out of the case, except as indicating that he saw them, probably with the naked eye, as he could hardly be looking in that locality for an intramercurial planet. Two or three stars of this constellation, but of the 5th and 6th magnitude, lay from 1½ to 3 degrees to the north and west of *d* arietis, but they do not appear to have been seen.

We are therefore reduced to the consideration of *d* Arietis as being the star which M. Truvelot saw. At our meeting he named the estimated distance of the observed star from the sun, and this estimated distance almost exactly tallies with the position of *d* Arietis; and the observing 3 deg. west and 3 deg. north are represented by 2¾ deg. west and 2½ deg. north; the estimated magnitude agreed with the actual magnitude; and the absence of disk and of phase agreed with the observer's statement that it was a star.

In my judgment but one condition remains unsatisfied, namely, that it was a red star. And it seems to me not unlikely that there may have been atmospheric or possibly cosmic conditions in that vicinity which gave the star a reddish hue; or that he may have a tendency to see an object with a reddish tinge. The seeing 41 and *e* Arietis as white stars might militate against this view. But in M. Truvelot's great atlas of astronomical drawings, and in his drawings of sun spots, in the Cambridge Annals, we can not help noting that his red spot on Jupiter is very brilliantly red as compared with the appearance to most observers; and in some of the sun spots we find a reddish tint added to the blackness of the dark centers, the same reddish tint not being visible to other observers. It would be interesting for M. Truvelot to institute comparison with other observers in order to settle this color question.

THE United States vessels which have so long laid at anchor at Mare Island have been sold and will be broken up. They are the steamer *Alaska*, monitor *Monadnock*, and steamers *Nyack*, *Saco* and *Tuscarora*. They brought $76,480.

Chromium.

Sources.

Until the past few years the source of all the chromium produced in this country was the chrome iron ore found quite abundantly in the Green Spring Valley, in Maryland. The important mines of this region are at Bare Hills, Soldiers' Delight, and Owing's Mills, in Baltimore County. Cecil and Harford counties have also furnished chrome iron ore, principally in the small crystalline form called sand ore. Lump ore is also obtained. The mines at Owing's Mills alone have yielded, in all, probably 5,000 tons. But this entire source has been practically abandoned, not from exhaustion of the mines, but because richer ore can be obtained from regions to be mentioned. As the cost of grinding and decomposing the ore is the same for rich and poor grades, the rich ores are naturally preferred. Moreover, the higher the percentage of chromium in the ore the easier is its decomposition and the less is the waste involved. An objectionable feature of the sand ore is that it contains silica in considerable quantity, and this forms silicate of potassium with the potash used, thus causing loss of alkali.

Quite recently a new deposit of chrome ore has been discovered in Jackson County, North Carolina. It promises to be of better quality than any other in the Eastern States.

Russia and Turkey have also supplied ore to the American market, and continue to do so in small amounts. But practically all the chrome ore used in this country at present comes from California, particularly from the neighborhood of San Luis Obispo.

The following information regarding the occurrence and mining of chromic iron ore in California is furnished by Mr. C. G. Yale: "This is a plentiful ore in many parts of the state. The only deposits from which much ore has as yet been extracted are located in San Luis Obispo, Napa, Sonoma, Del Nortc, and Placer counties. From some of these counties the shipments were several years ago considerable. Latterly, however, the business, proving unprofitable, has dwindled to small proportions. The chromic iron found in this state is of good quality, carrying from 40 to 60 per cent of the oxide, and commanding full prices in Baltimore, where the most of it was sent, some having been sent also to England. The mines near San Luis Obispo, five miles from the town, on the line of the San Luis Obispo and Santa Maria railroad, are the most prominent. Some three years since, chrome iron was found about seven miles east of Iowa Hill, Placer County. The ore, which is of good quality, is found in irregular masses, disconnected and imbedded in the country rock, and varying in weight from a few pounds to several hundred tons. Since this discovery the mining and shipping of chrome ore from Placer County is becoming an important industry. Shipments are made from Auburn regularly, the ore coming from points on the Forest Hill and Georgetown divides; a great deal also is being shipped from Colfax, being brought over from what is known as Brimstone Plains, a few miles above Iowa Hill. Smiley Bros. are the principal shippers from the latter point. Chrome deposits not yet opened are known to exist in other places in the country"

Character of Ores.

The character of chrome ore is practically the same whatever the source, although it varies in the amount of chromium oxide contained between 40 and 50 per cent. Its composition may be expressed by the formula Cr_2O_3FeO; but part of the chromium may be replaced by iron, or the iron may be partly replaced by magnesium. Aluminum is also sometimes present, and silica often accompanies the sand ore as an impurity.

Amount Mined.

About 2,500 net tons were obtained from California during 1882. The price paid in Baltimore is $40 per ton, with slight variations, according to percentage of chromium oxide.

Utilization.

All the chrome iron ore used in the United States at present is made into potassium bichromate, by Messrs. Jesse Tyson & Sons, Baltimore, with the exception of a very small quantity of sand ore, which is used in making chrome steel at the Brooklyn Chrome Steel Works. The amount so used does not exceed 1 per cent of the chrome ore mined. Bichromate of potassium is, then, the one salt of chromium from which all the others are obtained. The wholesale price of bichromate in 1882 was 15½ cents per pound. By far the greatest proportion of this salt is used in calico printing, the bichromate being dissolved in water, and then deposited on the cloth in the desired color by suitable reagents. It is also made into the pigments chrome yellow and chrome green. A small quantity is used in electric batteries. Besides the bichromate made in Baltimore, about 35 per cent of the whole amount used is imported from Scotland, under a duty of 3½ cents per pound. In 1882 the amount imported was 1,972,221 pounds. Formerly American chrome ore was exported to England, but latterly the English supply has come from Russia.

No chrome ore in any quantity has thus far been worked up outside of Baltimore; but about two years ago Messrs. Harrison Bros., of Philadelphia, established a branch of their color works, called the Kalion Works, where they have undertaken the decomposition of chrome ore; and it is believed they are still continuing the work.

Baltimore has for a long time enjoyed a monopoly in the manufacture of bichromate; not, however, without many efforts on the part of manufactures in other cities to obtain a footing in the trade. In the past eleven years no less than fifteen attempts have been made to establish works for decomposing chrome ore in other cities, particularly in Philadelphia, New York and Boston. Not only thousands but tens and even hundreds of thousands of dollars have been thrown away in these attempts to accomplish what is put down in the text books as a comparatively simple operation. Factories have been built, and arrangements made for grinding and decomposing the ore, but in very few cases has the experiment lasted long enough to result in the production of a single pound of bichromate. It is an extremely difficult matter to carry on this manufacture so well as to produce bichromate at 15½ cents per pound; but by long experience and methods of decomposition known only to themselves, Messr. Tyson & Sons have been able to maintain a successful business, and to compete with the two other manufactories in Scotland and France.—*David T. Ray in Williams' Mineral Resources.*

Speiss.

The scientific editor of our morning contemporary (the *Sentinel*) contributes half a column of learning in this morning's issue upon what he is pleased to denominate the "lead process," whatever that may be. This new light in science says "The process has proved very valuable, as is shown in the 'bonanza' developed in the Richmond slag dump," etc., leaving the inference that the Richmond Company have been using a "lead bath process" to work this speiss. Now, the Richmond Company use no "lead bath process," and have never used such a process, or thought of using such a process. The process used by the Richmond Company is the result of experiments commenced several years since by Mr. Probert, first in the laboratory and finally on a large scale at the furnaces, and long before the Richmond Company were aware that St. George Bryan had an existence upon this mundane sphere of ours. The scientist of the *Sentinel* is quite as much at fault in regard to Mr. Probert's whereabouts and contemplated movements. Mr. Probert is not en route to Washington City to measure swords, figuratively speaking, with the chivalric St. George, as the scientist of the *Sentinel* has it, but here in Eureka, attending to the business of this company, never having had and not having the remotest idea of going to Washington City. The fact is, St. George Bryan does not know enough about the process worked at the Richmond to apply for a patent for it if he wanted to. Just before leaving here he went to the Richmond works to learn something about it, and was incontinently invited to leave the premises. To the inventive genius of Mr. Probert the Richmond Company and this district owe the flue-dust arresters, the refinery, and best water-jacket furnaces now in use; and our citizens, we are sure, will not be slow in giving him due credit for any and all improvements he may make in new and improved modes of reducing ores, however much the *Sentinel* may labor for a different result—*Eureka Leader, Oct. 27th.*

Death of a Great Inventor.

Charles William Siemens, the scientist, engineer and electrician, died of rupture of the heart, in London, November 20th, aged 60. The deceased, ten days ago, received a fall, the effects of which caused his death. Charles William Siemens was born at Lenthe, Germany, on April 4, 1823. After completing his education at Gottingen, he entered the Stolberg Machine Works, and in 1843 settled in London as a civil engineer. With his brother Werner he carried on investigations in electro-magnetism, and made several important improvements in the manufacture of submarine cables, and the mode of securing their insulation. The firm of Siemens Brothers has constructed many of the most important existing submarine telegraph lines, and has the contract for the new Bennett-Mackay cable. The Siemens Brothers' regenerative gas furnace and rotary furnace are of great use in the manufacture of steel. By the Siemens process the celebrated Landore mild steel is produced, hundreds of thousands of tons of which are annually manufactured.

Among the other inventions of Dr. Siemens and his brother, with whom he was always intimately associated, are the water meter, an economical steam engine, a method of gold and silver plating, the process of anastatic printing, the double cylinder air-pump, the chronometric governor, the hydraulic brake, to prevent the recoil of artillery on ships, and many other scientific instruments. But the invention with which Dr. Siemens' name has most recently been associated is the Siemens electric light, which is extensively used in England and on the continent of Europe, especially in Paris. Dr. Siemens has held many honorary positions, and stood in the very front rank of electricians. He was made a doctor of civil law by Oxford University in 1869.

A Hybrid Oak.

The following paper, by Mrs. Mary K. Curran, on "a Hybrid Oak near Folsom" (*Quercus Kelloggii* and *Q. Wislizeni*), was read at a recent meeting of the California Academy of Sciences.

The oak which is here described has been under observation for the greater part of this year. The first tree observed was at New York Ravine, a few miles above Folsom. At the first glance I thought it to be *Q. Kelloggii*—the color and texture of the leaves being very similar, and it did not at once occur to me that at that time of the year—early in March—*Q. Kelloggii* had no business to have any leaves at all, for it is our earliest deciduous oak. But soon recognizing the fact that it was an evergreen with which I had to deal, I took notice of its peculiarities, and its location, for further observation. At different times during the year other trees have been noticed, probably fifty or more, but never in groves. They are found singly in somewhat shaded localities and in the line where *Q. Kelloggii* and *Q. Wislizeni* meet. The general aspect of the tree, as before stated, is that of *Q. Kelloggii*. Its light-green color makes it appear strikingly different when it happens to be found near a clump of the dense dark-green *Q. Wislizeni*.

The tree is of middle size. The largest observed was about eighteen inches in diameter, and thirty or forty feet in height. The leaves are from 3 to 6 inches in length by 2 to 5 in breadth, narrowed below into a petiole from 4 to 10 lines in length. Leaves and petioles pubescent at first, but soon glabrous, usually lobe-dentate; cup hemispherical; acorn, three-fourths to one inch wide by one and one-half long; pubescent more nearly, as well as the cup of the type of *Q. Kelloggii*. The leaves are subpersistent, remaining a little more than a year, but clothing the branches scantily. Unfortunately other duties prevented their being observed at the time of flowering.

The tree which was first noticed did not fruit this year, but on a recent expedition I found others fruiting abundantly near Newcastle, Placer County.

Hybridity among the oaks is very difficult of determination, on account of their extreme variability. Several other probable ones have been noticed during the year, but sufficient material has not been collected. The one just described will be probably easier of identification than any other, as its parent oaks differ so greatly in the persistence of their leaves.

Bonding Mining Properties.

Among many owners of properties there exists a certain antipathy to bonding the claims. As against a certain class this antipathy is well founded. In every camp are men who seek to obtain the control of properties, by bond or otherwise, who have no money themselves, neither can they command any. This class should be left severely alone.

On the other hand, we have men who desire to purchase property for themselves or to find a purchaser, and who under favorable circumstances will consummate what they undertake. These men, when they undertake an enterprise of this kind, wish to be in a position whereby if they accomplish any thing that they may have the benefit of their efforts. Such men should be encouraged. Owners should deal liberally with them. They will find it to their interest to do so. A reasonable length of time should be given them in which to take the property themselves to be a purchaser. No exorbitant "bonus," as it is termed, or even none at all, should he demanded. Most owners of mining property expect to realize on the sale of a property, not from its production, many of them being too poor to place it on a productive basis.

When the right kind of a man is found, who is willing to spend his time and money in consummating a sale, that should be considered a sufficient bonus for him to risk, while the owner should regard the chances of a sale sufficient consideration for giving such a man control of the property.

It is to the interest of all to enlist in any mining camp the aid of outside capital. It is the only way whereby a large number of properties can be placed upon a paying basis, thus giving that prosperity which can only be secured by a large production of ore. So long as men will stand in their own light by not placing themselves in the proper position to consummate a sale to capitalists, just so long will they fail to realize any thing from their properties; just so long will we have a large number of unproductive properties which a little outside aid would make productive. We do not wish to be understood as advising a reckless bonding of claims to any man that presents himself, but if the right man does do not hesitate to give him a chance, thereby adding to your own chances of wealth as well as to the prosperity of the camp. —*San Miguel Journal.*

A NEW DEVICE invented by Edward Burke, Bernard, Iowa, for converting reciprocating into rotary motion, and vice versa, consists of the combination of two or more shafts provided with pulleys, of a link or other belt connecting said pulleys, and a pitman connection to said belt, the construction being such that the end of the pitman will continuously travel with the belt in its movement around the pulley, and communicate its power thereto.

THE ENGINEER.

Ship Structure.

For the second time, the prevailing style of ship structure is threatened seriously with mechanical revolution. The Winans system of double cigar-shape has never grown beyond experiment, save in the building of torpedo boats, and in some instances of light pontoons. The new model steamer *Meteor*, now building at Boston, has, however, novelties in construction that will demand considerable attention from the seafaring world. A description says: "The oval deck, with other peculiarities of construction, will render it almost impossible to sink her in any weather. It is asserted, if launched upside down she would right herself in the water. Her shape somewhat resembles a spinning-top cut in two, and her speed is calculated at twenty-five miles an hour. Many captains of ocean steamers say she is the only proper model for the Atlantic, and larger vessels constructed on her lines would take but five days to make the distance between New York and Liverpool."

FAST FERRY BOATS.—The crowded state of the harbors and roadsteads in nearly every portion of the globe is bringing to the attention of the ship builders the fact that handiness is becoming a prime requisite in vessels of all kinds. When a ferry-boat or a steamer, be she large or small, can maintain her normal speed and get out of the way of other vessels, instead of having to stop and wait, a very material increase in the net speed results, and this handiness consequently increases the paying capacity of a given plant. It is vastly easier to avoid obstacles—other vessels and the obstructions to water traffic—by turning at full speed than it is by stopping. Large Atlantic vessels, even with hand-steering gear, can turn at right angles to their course in a shorter distance than they can stop. With steam-steering gear or with twin propellers this power of turning becomes vastly valuable. When fifteen days were required for crossing the Atlantic the waste of two or three hours in docking a vessel was not felt; but now, when the voyage occupies but little more than seven days, it is a matter of some importance to get the ship into her berth as soon as possible after she reaches the harbor, and here handiness becomes a very paying quality.

THE CHANNEL TUNNEL.—English conservatism still holds out against the channel tunnel project. The only safety for England, according to her military guardians, is in maintaining her insular condition and stubbornly refusing to be brought into any closer relation with the rest of mankind. This theory seems to make war upon the very spirit and essence of civilization, and must surely go down under the assaults of an enlightened public opinion. But if the tunnel must not be permitted, how will it be with the railroad bridge which the French Government now proposes to build, or cause to be built, across the Straits of Dover, from Cape Grinez to Folkstone? As soundings for piers have already been authorized, it would appear that serious business is intended; but a bridge is certainly no less objectionable than a tunnel, if the purpose be to keep everybody out of the island, and proclaim a perpetual state of siege.

NAVAL ARCHITECTURE is now making steamships as symmetrically beautiful as were the sailing craft in the vaunted days of Nelson. Not only are the latest English cruisers models of destructive ingenuity and ponderable force, but they are built with due regard to the apothegm that "a thing of beauty is a joy forever." They are made of steel sheathed in wood, and in external appearance resemble somewhat the smart frigates of the days of Collingwood. These new vessels are veritable cruisers, made for sailing as well as fighting, and having canvas and screw will make fast time through the water. So perfect is the architectural work that the latest addition to the navy, the Calypso, a comparatively small vessel of not more than 2,000 tons displacement, will take nearly as large a crew as some of the iron-clads three or four times her size, and carries from twelve to sixteen breech-loading cannon.

THE PANAMA CANAL.—The great work of constructing the Panama canal is being pushed with much energy. More than ten thousand men, thirty steam excavators, forty locomotives and eight hundred tip cars are employed, and the force will soon be augmented to 15,000 men. The total length of the canal is 46 miles. Meantime Captain Eads is actually at work on his ship railway across the isthmus, much further to the north, and it begins to be a question which will first afford a highway for shipping between the Atlantic and Pacific oceans, and thus furnish a competitor to the transcontinental railways.

TWO THOUSAND Chinamen are said to be at work between Helena and Missoula, improving the road-bed of the Northern Pacific.

USEFUL INFORMATION.

Boring Deep Wells by Water Pressure.

A new and great advance has been made in sinking deep-well pipes, say from 100 to 300 feet or more in depth, in soil that will resist the sinking of the driven well-pipe.

The hydraulic pressure system has been successfully applied at Adams, Mass., where six artesian wells are now flowing; one of 187 feet in depth, which was sunk in two hours; five wells of from 100 to 150 feet in depth, one of which has a 10-inch pipe, from which flows 400 gallons per minute, under a head of 13 feet above the surface of the ground.

The method of sinking these wells is by the boring power of water under pressure, the pressure being obtained by a steam pump; or in places where a steam pump is not available a hand force-pump answers the purpose. A peculiar feature was developed in the experiments made in perfecting this system, and the stern fact brought to light that a stream of water forced into the top of the pipe would keep an opening around the outside of the pipe for a depth of 40 or 50 feet, and would reopen the passage after stopping to put on an additional length of pipe; but after getting down to greater depths the stopping of the flow would allow the sand, gravel and stones to settle down and wedge the pipe so tight that no available pressure could start it again. In the avoiding of this difficulty consists the novelty of this system. The placing in the line of pipe at every two or three lengths of a three-way cock, with the use of two lines of hose, gives a perfect control and steadiness of the flow down the pipe during the whole operation. The hose is then attached to the side outlet of the three-way cock, with the plug across the upper outlet, and the section of pipe is sunk until the attached hose reaches the ground, when another section is added and another hose is attached to the next three-way cock, as before, and the pressure of water put on, when the lower cock is turned so as to shut off the lower hose and continue the stream from the upper hose. In this way a depth of 200 or 300 feet may be attained without difficulty, possibly a much greater depth. A curious property of the power of water in keeping an open passage in an ascending current has been observed in these experiments. A plumb-bob upon a line was dropped to a depth of 50 feet upon the outside of one of these pipes while in the process of sinking, and again hauled to the surface, showing that the current maintains a clear space around the outside of the pipe, probably for its whole depth; for in addition to this, the pipe is so loose in the hole that it can be turned around by the hand, and feeds itself down. The inventor of this system is Jarvis B. Edson, of North Adams, Mass.—*Scientific American.*

EXPERIMENTS WITH BREAD.—Dr. Von Meyer and Prof. Kolbe have of late been making experiments with bread. They took salicylous acid and mixed it with the dough. In one case they saturated the dough with it. In another experiment they proceeded in the same manner, but added acid sulphate of potash to the salicylous acid, the experiments being made for the purpose of noting the preservative and other qualities in each case. After baking, the bread was thoroughly dried in the open air. Then the loaves were washed in salicylic water and placed in closed wooden bread chests. At the end of twenty-seven days after this operation the bread in both cases was free from mold, and inside the crust it was moist, and tasted nicely. At the end of forty-four days the bread which had been treated with salicylous acid alone was covered with mold, which reached deep into the interior of the loaves. In the bread which had been treated with the salicylous acid and potash, there was only a little mold, and that where the loaves chanced to touch the other bread. In its interior this bread was entirely devoid of mold, though, naturally, somewhat more dry than at the end of the twenty-seventh day. Later similar experiments made by these gentlemen led to similar results. Basing one's opinion on the above alleged results, one can safely conclude that bread thus treated with salicylous acid and potash will, in the heat of summer, keep free from mold and spoiling for from six to eight weeks, and quite likely longer. *Mueller Zeitung.*

OIL FOR WAGON WHEELS.—A practical man says: "I have a wagon, of which, six years ago, the fellies shrank so that the tires became loose. I gave it a good coat of hot oil, and every year since it has had a coat of oil or paint, sometimes both. The tires are tight yet, and they have not been set for eight or nine years. Many farmers think that as soon as wagon fellies begin to shrink they must go at once to a blacksmith shop and get the tire set. Instead of doing that—which is often a damage to the wheels, causing them to dish—if they will get some linseed oil and heat it boiling hot and give the fellies all the oil they can take, it will fill them up to their usual size, and tighten and keep them from shrinking, and also keep out the water. If you don't wish to go to the trouble of mixing paint, you can heat the oil and tie a rag to a stick, and swab them over as long as they will take oil. A brush is more convenient to use, but a swab will answer if you do not wish to buy a brush. It is quite a saving of time and money to look after the woodwork of farm machinery. Alternate wetting and drying injures and causes the best wood soon to decay and loses its strength unless kept well painted. It pays to keep a little oil on hand to oil fork handles, rakes, neck-yokes, whiffletrees, and any of the small tools on the farm that are more or less exposed."

PAPER PULP FROM CEDAR BARK.—A new use of cedar bark has been undertaken at New Bedford, Massachusetts. According to the *Northwestern Lumberman*, the Acushnet paper-mill, at that point, is nearing completion, and was built for the express purpose of manufacturing pulp and paper of cedar bark. It is the first enterprise of the kind ever undertaken, though the process has been satisfactorily tested on a small scale. An agent of the company is now in Maine purchasing a supply of bark. There is a large quantity at Bangor, Calais, and St. John, N. B., where large quantities of cedar shingles are sawed. The bark is taken from shingle butts that are 16 inches long, and are bundled for shipment like laths. The Acushnet mill will work up three cords of bark a day. The first product will be used for carpet linings, but the paper is said to be equally adapted to other important uses. For carpet linings it will be unequaled, on account of its quality of keeping off insects. Eastern ingenuity is bound to devise an endless variety for the utilization of woods, this invention for making paper of cedar bark being the latest evidence of it.

VEGETABLE WOOL.—The *Moniteur des Fils et Tissus* calls attention to a description of a vegetable wool called *Kapoc*. It comes from Java, and a specimen is on view at the Amsterdam Exhibition. It arrives at Amsterdam in its leathery covering, being itself enveloped in the seeds. It is then freed from both, and is carded so as to make a very light mattress wool, worth about 8½*d.* per pound. One of the houses engaged in this operation had made trials in spinning and dyeing this material, but the filaments are said to be like strings, and their industrial application, consequently, a matter of uncertainty.

COTTONWOOD lumber is said to be admirably adapted for the manufacture of cases for packing dry goods. Millions of feet of this species of tree are converted into boxes every year in Ohio. As it readily imbibes moisture, and therefore swells, it is not well suited to house-building purposes.

GOOD HEALTH.

A Dangerous Remedy.

It has been discovered that the extract of the yellow jessamine of the South is an effective remedy for poison oak. The extract is employed as a wash by mixing a half drachm of carbolic acid, two drachms of the fluid extract of gelsemium, one-half once of glycerine and four ounces of water.—*Southern Trade Gazette.*

And while you are putting forth such a remedy why don't you also say that yellow jessamine, or gelsemium, as the alcoholic extract of yellow jessamine root bark is known, is one of the most deadly poisons known. It is also one of the most deceitful remedies, as its first effect is to allay all excitement, while it marches on to insensibility, unconsciousness, and certain death. Dipping the hand in the extract (if strong) and then sucking the fingers has caused death. A few drops, if taken internally, will cause death with some temperaments, and a very small dose, comparatively, will cause the strongest man to succumb. No certain remedy or antidote is positively known. Negroes in the South have told us that plentiful doses of fine salt, swallowed at once, and to keep the persons poisoned on their feet and moving, would counteract its effects. An emetic is of no use; the poison enters into the circulation at once. The medical men know of no certain antidote. Gelsemium has been used, and a number of chemical reagents used with no positive success. What cures in one case has no permanent effect in another. A physician recently lost his life in New Haven, Conn., by an overdose. If you turn snakes loose tell your readers they are rattlesnakes, or else acknowledge your ignorance, but we warn our readers that gelsemium is poison of the most subtile kind, and sure as death.—*Cotton, Wool and Iron.*

HOT WATER FOR INFLAMED MUCOUS SURFACES.—Dr. George R. Shepherd, Hartford, Conn., says in the *Medical Record*: I have used hot water as a gargle for the past six or eight years, having been led to do so from seeing its beneficial effects in gynecology. In acute pharyngitis and tonsillitis, if properly used at the commencement of the attack, it constitutes one of our most effective remedies, being frequently promptly curative. If used later in the disease or in chronic cases, it is always beneficial, though perhaps not so immediately curative. To be of service it should be used in considerable quantity (a half a pint or pint) at a time, and just as hot as the throat will tolerate. I have seen many cases of acute disease thus aborted, and can commend the method with great confidence. I believe it may be taken as an established fact that in the treatment of inflammations generally, and those of the mucous membranes in particular, moist heat is of service, and in most cases hot water is preferable to steam. All are familiar with its use in ophthalmia and conjunctivitis, as also in inflammation of the external and middle ear, and I feel confident that those who employ it for that most annoying of all slight troubles to prescribe for, viz., a cold in the head or acute coryza, will seldom think of using the irritating drugs mentioned in the books, nor of inducing complete anæsthesia with chloroform in preference to the hot water douche.

SUGAR AS AN ARTICLE OF DIET.—Dutrone calls sugar the "most perfect alimentary substance in nature." Dr. Rush says: "Sugar affords the greatest quantity of nourishment in a given quantity of matter of any substance in nature." Sir John Pringle tells us that the plague has never been known to visit any country where sugar composes a material part of the diet of the inhabitants. Dr. Cullen is of the opinion that the frequency of malignant fevers of all kinds has been lessened by the use of sugar. The celebrated Trouchina recommended sweetened water for almost every malady. Dr. Frothergill was very anxious that the price of sugar should be so far reduced as to make it accessible to the common people. Dr. Franklin had taken large quantities of blackberry jam for relief from pain of the stone, but discovered at length that the sanitary property resided wholly in the sugar. Sugar has been found to be an antidote to the poison of verdigris, if taken speedily and in abundance. It has been said that sugar injures the teeth, but this does not deserve a serious reflection. The plentiful use of sugar is one of the best preventatives of the diseases produced by worms. Nature seems to have implanted love for this aliment in children, as if it were on purpose to defend them from those diseases.

THE PULSE OF ANIMALS.—The health of animals, as well as that of human beings, may often be guessed at very shrewdly by simply feeling their pulse. In a horse a good and strong but quiet pulse beats forty times a minute, in an ox fifty to fifty-five, in sheep and pigs not less than seventy nor more than eighty for ordinary health. It may be felt wherever a large artery crosses a bone. In the horse it is generally felt on the cord which crosses over the bone of the lower jaw in front of its curved position, or in the bony ridge above the eye; and in cattle over the middle of the first rib. In sheep it is, perhaps, easiest to place the hand on the left side, where the beating of the heart may be felt. A rapid, hard, and full pulse in stock points to inflammation and high fever; a rapid, small, and weak pulse also to fever, but to fever accompanied by a poor and weak state of the subject. A very slow pulse in stock will often be found to indicate brain disease, while a jumping and irregular pulse shows something wrong with the heart.—*London Graphic.*

EFFECTS OF ELECTRICITY UPON THE NERVES AND HEART.—Among the curious exhibits at the late Munich Electrical Exhibition were a series of photographs representing the various changes and contortions produced in the human face by subjecting the different facial nerves of a patient to the action of electricity. The expressions of joy, pain, surprise, doubt, disgust, etc., were easily realized, according to the nerve that was touched by the electrode. Other observations and experiments were made by Prof. Von Zeimssen which promise to be of great importance. A comparison was instituted between the continuous and induced current in the stimulation of the important accelerator and depressor nerves which control the heart. The professor found that an induced current, so far from stimulating the nerves of the heart, as heretofore believed, is perfectly inoperative, whereas a continuous current from an ordinary battery is of the very greatest activity.

SIGNS OF SHORT AND LONG LIFE.—Lord Bacon's signs of short life are quick growth; fair, soft skin; soft, fine hair; early corpulence; large head, short neck; small mouth, fat ear, brittle, separated teeth. Some of his signs of long life are slow growth, hard, coarse hair, rough, freckled skin; deep furrows in the forehead, firm flesh, with veins lying high; wide nostrils; large mouth; hard, gristly ear; strong, contiguous teeth. He adds that early gray hair is not significant, some of the longest livers having turned gray in early life.

CURE FOR SMALLPOX.—In an old copy of the *Boston Journal* we find the following: "I am willing to risk my reputation as a public man," wrote Edward Hine to the Liverpool *Mercury*, "if the worst case of smallpox can not be cured in three days, simply by the use of cream of tartar. One ounce of cream of tartar dissolved in a pint of water, drank at intervals, when cold, is a never-failing remedy. It has cured thousands, never leaves a mark, never causes blindness, and avoids tedious lingering."

A SINGLE Eastern railroad recently discharged twenty-seven employees for color-blindness.

IT is said that dwarfs die of premature old age, and giants of exhaustion.

Passing Events.

The notable event of the week in mining circles has been the decision in the Northern Belle and Holmes mining companies suit, in which the latter was awarded large damages. We refer to the matter more fully elsewhere.

All good American citizens, being so instructed by their President and Governors, kept one day this week as a holiday, most of them celebrating the occasion by a Thanksgiving dinner, this form of celebrating being now properly recognized.

The shipment this week to the Comstock of a heavy pumping outfit is an event worthy of more than passing notice, and we give a description of the machinery in another column.

BEAR VALLEY.—"The lake to be made in Bear Valley, by a dam across the Bear Canyon, is near completion. The lake will cover nearly 1,000 acres of land, and furnish summer irrigation for a large amount of land in San Bernardino, besides water power for manufacturing purposes and good duck hunting in the winter. It will be a grand and profitable enterprise, and we hope will induce the making of many more similar ponds."—Los Angeles *Herald*.

Bear Valley is situated in the mountains of San Bernardino County, and is principally owned by parties interested in the settlement of the Redlands.

Foundry Notes.

The Hydraulic Pumps for the Chollar, Norcross and Savage Mining Companies.

On Saturday last the large hydraulic pump for the above mining companies was set in operation at the Risdon Iron Works of this city, and was kept running until noon of the following Monday, to enable those interested to inspect the massive machinery in motion.

The trial was most satisfactory, and immediately it was over a large force of mechanics was set to work to take the machinery apart for the purpose of shipping it to its destination, where it will be set in final operation just as soon as it is possible to get it in position.

The new pump is of the same capacity as that built in 1881 for the above companies, and is an extension to the present system. The first pump was placed at the 2,400-foot level of the Chollar mine, and is now raising 2,000 gallons of water per minute through a vertical height of 800 feet, and discharging the same into the Sutro tunnel, which enters the mine at the 1,600-foot level. The new pump will be placed 230 feet below the present one, and will raise 2,000 gallons of water per minute from the 2,630-foot level to the Sutro tunnel in a single lift of 1,030 feet.

The motive power will be water supplied from the Virginia and Gold Hill Water Works, although the pumps are so constructed that in case of failure of water supply they can be run equally well by a surface steam-engine and accumulator, which renders them independent of either in case of accident to one.

The Pump

In itself consists of two hollow brass plungers 13⅝ inches in diameter, lying horizontally opposite each other, and connected by a cross-head sliding on the main bedplate. These are the pump plungers, and on either side of them are two brass power rams 7½ inches in diameter, also connected to the above cross-head. By admitting water to these power rams, the motion which takes place is transmitted by means of the cross-head to the pump plungers, which admit the water into the pump on one stroke and force it up the shaft on the return stroke. Many improvements have been applied to the new pumps, the most important of which is the

Valve Motion

Recently invented by Mr. Joseph Moore. By means of this motion the pressure and exhaust valves will be under perfect control, and the action of one valve will be dependent upon the motion of the other. The pipes which supply water to these pumps are four miles long, and it can therefore be readily understood why all sudden closings of the valves must be avoided. The pressure pipes in the shaft are of cast iron, 8 inches inside diameter and 2 inches thick. The return pipes are also of cast iron, 10 inches in diameter, while the two discharge columns are of wrought iron, 14 inches in diameter and 5-16 inch thick. Each of the above pipes are fitted with cast-iron air-chambers 18 inches in diameter and 25 feet high, for the purpose of taking up the momentum of the water while being brought to rest by the closing of the pump valves.

The thickness of the metal in these chambers varies from 4″ on the pressure pipes to 3″ on the return pipes.

The Pipe Joints

Are made male and female, with gaskets of copper and lead. The pipes are also fitted with flexible joints—a new and simple arrangement which allows for the movement of the pipes in the shaft, and one that is much superior to the usual slipjoint and gooseneck. The working pressure of the pumps will be 3030 feet head of water, and each casting has been tested to 4,000 pounds per square inch. The heaviest thickness of cast iron used in any part is 4″, although in many places, and in every instance where tin pipes or nozzles run into one another, large wrought iron bolts have been shrunk in to take part of the strain, which, without them, would be too great for the castings to bear.

In connection with the foregoing station pump, the Risdon Iron Works build

A Suction or Sinking Pump

Used in the same capacity as the ordinary Cornish lift pump, over which it has many advantages. The pump proper consists of two hollow plungers, one placed over and as a continuation of the lower plunger, the lower plunger being twice the area of the upper. A valve is put at the bottom of the lower, and below that again in a valve chamber is another valve, or lower clock valve, and below this the wind hose. On each side of these plungers are placed two actuating rams proportioned in size to the work to be done, and of the same stroke as the plungers. The discharge pipe rises from the top of the upper ram chamber, and the two pressure pipes are connected, one from the pair of upper rams and one from the two lower rams. The whole arrangement takes up very little room, and is suspended between guides running from top to bottom of the shaft by rods which support the total weight of the pump and the water being raised. On the surface, across the shaft is a cross-girder which supports a hydraulic ram or lift, capable of raising the whole weight, and below this girder are two sliding pipes in stuffing boxes, which allow the pressure pipes to move, say eight or ten feet up or down, without breaking the water connection or interfering with the working of the pumps. The discharge pipe can be operated in the same way, but is usually led off to one side, and lengthened or shortened as may be required, just as in the Cornish sinking-lift. The two pressure pipes are led to a surface engine, to which is attached two plain plungers of the same area as those below. A direct-acting steam-engine is most convenient whose piston-rod is continued through each end of the cylinder, and forms the plungers above referred to.

The Mode of Action.

The mode of action is to lower the pump into the sump by means of the hydraulic ram on top; then start the surface engine, a stroke of which, say to the left, forces the water down the left-hand pressure pipes to the lower power rams of the sinking pump, thus raising them, and with them the main plunger to the top of the stroke. Upon reversing the engine on the surface the water is forced down the right-hand pipes and up the left, thus forcing the upper rams down to the bottom of the stroke, and so on, each stroke discharging equal quantities, of water to the surface; that is one-half the contents of the lower or large ram is sent to the surface, while the other half takes the place of the upper ram. On the next up stroke the lower ram draws from the sump its full capacity of water, and the upper ram displaces its capacity, which is forced to the surface. Thus on each stroke one-half of the quantity sucked up by the lower or larger ram is sent to the surface in equal quantities.

When a blast is to be fired in the sump a signal to that effect is sent to the surface. By means of a small valve water is then admitted to the hydraulic ram, and in a few moments the whole pump is lifted free from the bottom and out of the way of the shot, to be again lowered and set to work when the blasting is over. As the work progresses pipes are added and hanging links put in just in the same manner as in the Cornish sinking lift.

The Whole System

Is remarkably simple and cheap, and works with great economy, its chief advantage being that depths of 1,000 feet can be sunk with one lift as easily as with the Cornish lift of 200 feet, with additional plungers of every 200 feet thereafter, besides all the inconvenience and expense of spear-rods, balance-bobs and stations. It can also be withdrawn with equal ease should the mine become full of water, and can be run as well above as under water. The room taken up in the shaft is very little; the whole can be put in one compartment of a shaft and still leave room for a cage to travel up and down. Another advantage is that it can be operated in winzes away from the main shaft any distance. It is particularly well adapted when surface water power can be obtained to drive the two surface rams, and the water can then be applied to the station pumps or sinking lift in the manner above described.

Blasting in Mines—No. 16.

Vigorit Powder.

The principle adopted in the manufacture of vigorit powder consists in a combination of nitro-glycerine with an oxidizing agent on the one hand, and a carbon-furnishing element on the other. As we stated once before in this series of articles, there is no intention of going into the questions of relative merits of the different powders in use, but simply to give some facts concerning each kind, and directions for using it. As to the qualities of vigorit, we give from the report of Wm. R. Quinan, Superintendent of the California Vigorit Powder Company, a summing up of the characteristics of the powder, as follows:

First.—It is one of the strongest, and its strength is more uniform than any other, from the nature of the absorbents, and the thorough incorporation of the ingredients. This can be shown by successive tests in the pressure gauge. Neither does the strength vary from hygrometric changes of the atmosphere.

Second.—It is safe against spontaneous decomposition. The nitro-glycerine is made from the best materials, and is thoroughly purified before being put into the powder.

Third.—It does not leak. The nitro-glycerine is better absorbed than in most powders. It does not lose strength in this way, and there is no exuding nitro-glycerine to render its transportation and handling perilous.

Fourth.—It is not deliquescent, and can be used in wet holes as well as dry. It can be stored in damp places without spoiling. It does not undergo sudden changes of character in regard to sensitiveness leading to accidents in its use.

Fifth.—It is safe against fire, friction and the shocks and jars of use.

Sixth.—It is resilient and elastic, and can be tamped with perfect safety so as to get any desired degree of condensation in the bore-hole.

Seventh.—It loses less in strength from freezing than any other nitro-glycerine powder, because it is less dependent upon the nitro-glycerine.

Eighth.—It is more efficient than most other powders under slight confinement, because it is more susceptible to detonation by the cap.

Ninth.—When exploded there is no fine dust or poisonous matter scattered through the atmosphere to be inhaled into the miner's lungs, to his discomfort or detriment.

Tenth.—The gases produced by explosion are innoxious. Most of the visible smoke is condensed aqueous vapor, which requires but a few moments to dissipate. The poisonous carbonic oxide and irritating, throat-rasping oxides of nitrogen are avoided by properly proportioning the oxygen to the other chemical elements, and by making the powder susceptible to perfect detonation by the cap.

Directions for Using Vigorit Powder.

1st. If the cartridge does not completely fill the drill-hole, cut it longitudinally, and ram it hard to the bottom with a wooden tamping-rod. If the cartridge is too large, remove the wrapper and press the powder down solidly. Ram each successive cartridge as hard as you see fit, without fear of explosion.

2d. When the primer and cap are placed in the drill-hole, press gently until you are sure they are in contact with the charge. Then tamp softly with sand or fine rock until you are sure that they are not liable to be misplaced. Afterwards tamp the remainder of the drill-hole with broken rock or fine gravel, as hard as you can without using the hammer. The more the hole is tamped the greater will be the result of the explosion.

3d. For springing a deep hole for the reception of black powder, first drop a sufficient number of cartridges, and after them the primer, with the fuse already lighted. If you wish, pour in water for tamping.

4th. If the hole is a wet one, smear the top of the primer and the fuse and cap with grease or tar or prepared gutta-percha, so as to protect it from the water.

5th. Always, if possible, use the triple-force caps.

6th. The powder will explode when frozen, but will act with diminished force. It will be better to thaw it out, either by laying in the sun or by placing in a dry tin vessel resting in a bucket of hot water; if thawed in an atmosphere of steam, the glue will be melted and the cartridge will be likely to open.

7th. Never thaw the powder by placing it upon a hot stove or before an open fire.

8th. Invariably prepare your primer at a distance from your powder, and always keep your caps and fuse outside of the mine, if practicable. Hundreds of mishaps have happened from the fuse or caps having become injured by dampness in the mine. Never store your caps in the powder magazine.

9th. In a hole completely full of water no tamping is required. Be sure that your powder is at the bottom of the hole.

If peculiarities of rock are discovered by consumers, leading to the belief that a powder of a slower or of a more rapid action will be most efficient, a description of the rock, and of the kind of powder supposed to be needed, may be sent Mr. Quinan, to the care of English, Wright & Lukens, 327 Pine street, S. F., and he will especially manufacture lots of powder for such purposes. In all such cases the applicant should be sure and state whether the holes be wet or dry.

Directions for Using Vigorit Low Powder.

STRENGTH.—This powder is the equivalent of black powder, but must be fired with a cap, or better still, with a cap and primer of high powder.

HOLES.—The holes in which it is used should be large, as in the case of black powder, or else the holes should be sprung at the bottom by a cartridge of high powder, so as to form a chamber.

CHARGING.—The powder is poured in loose and rammed down with a wooden rod, then put in the cap and primer; be sure it is down on the powder; then put in the tamping and pack it tightly in the hole.

REMARKS.—The powder is readily injured by water. The holes, therefore, should be dry. It will also gather moisture from the air if the box is left open in damp weather. Be careful to keep the lid on the box. If the powder should be injured by absorbing moisture, it can be restored by spreading it out in the sun when the weather is dry.

Collecting Flue Dust.

In order to make the description of the process quite clear, sections of the flues at different parts of its course have been given, both to show their methods of construction and the means used for obtaining both volume and surface.

Fig. 1 is the flue leading from shaft furnace No. 2 to its union with that leading from No. 3, and from the point where the flues of Nos. 2 and 3 join, to the main flue; and also the flue leading from shaft furnace No. 4 to its union with the flue leading from shaft furnace No. 3.

Fig. 2 is the flue leading from shaft furnace No. 3 to the union of the flue with that from shaft furnace No. 2.

Fig. 3 is the flue from shaft furnace No. 1 to the main flue.

Fig. 4 is the flue from shaft furnace No. 5 to the main flue.

Fig. 5 is the flue from the point of union of the shaft furnace flues to the condensing chamber at Station 16.

Fig. 6 is the flue from the six most southerly roasting furnaces to the main flue, and also the flue from the dressed-ore storehouse to the two most northerly double-roasting furnaces.

Fig. 7 is the flue from the two most northerly double-roasting furnaces to the end of the dressed ore storehouse; also the flue which runs by the most northerly roasting furnaces.

Fig. 8 is the flue of the most northerly roasting furnaces.

Fig. 9 is the flat flue of the most northerly roasting furnaces.

Fig. 10 is the first condensing chamber on the top of the first incline at Station 16.

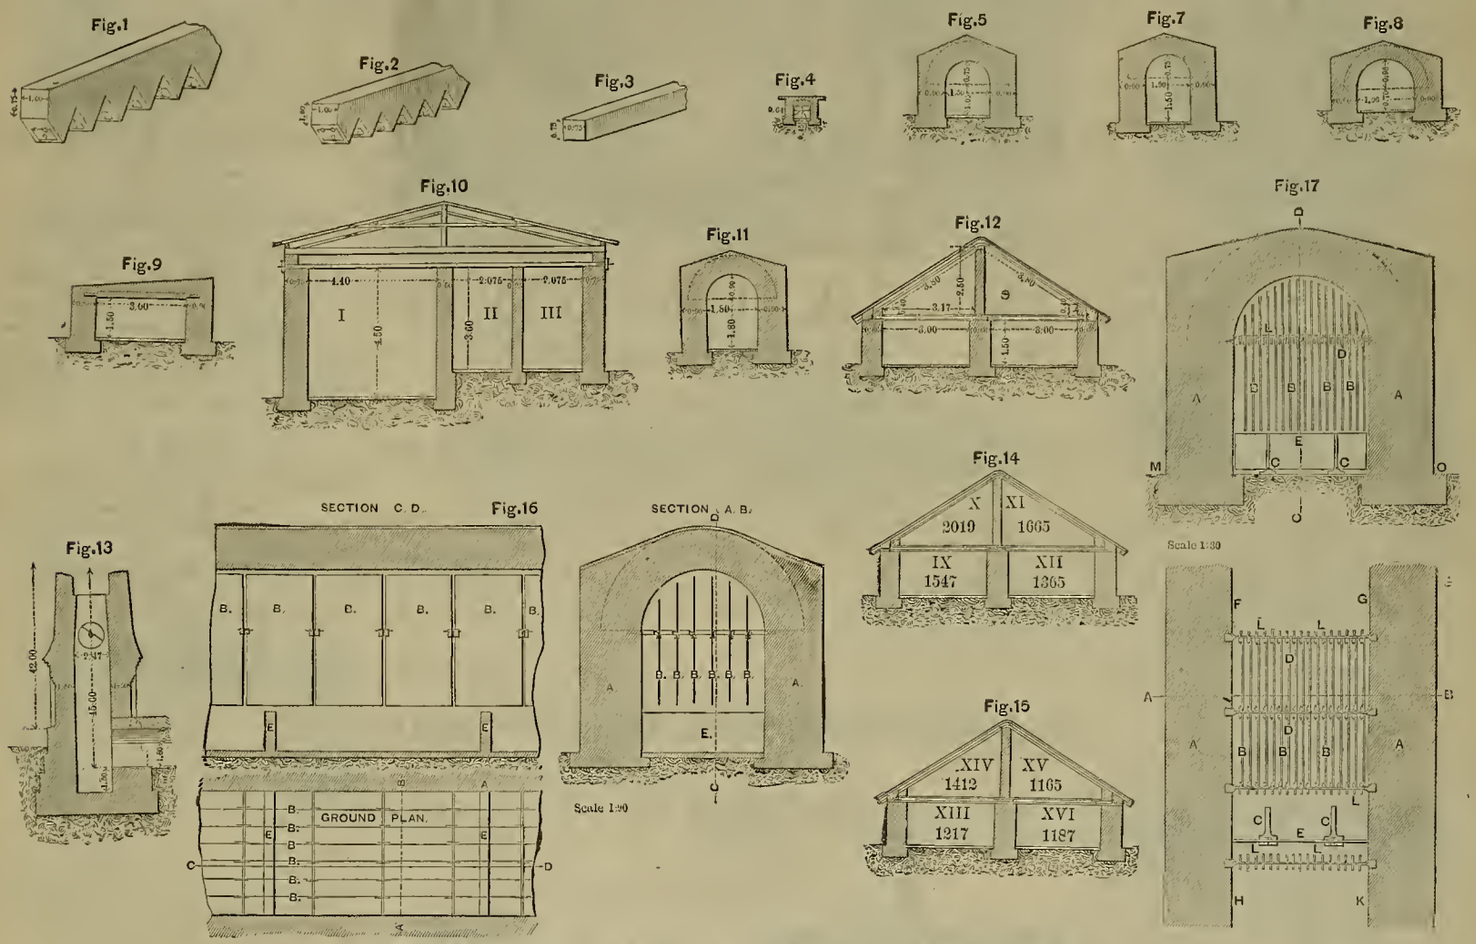

Fig. 11 is the flue from the condensing chamber to the outside of the old chimney at Station 22, and from here to the edge of the woods, and from the edge of the woods to the flues connecting with the chimney at Station 47 on the top of the hill; also the flues connecting with the chimney.

Fig. 12 is the condensing chambers X and Y beyond the chimney, but connecting with it.

The flues in the interior of the shaft-furnace building are made of sheet-iron plates 1½ millimeters thick, and are hung 30 centimeters above the throat of the furnace. Figs. 1, 2, 3, show some of the flues which lead from the cupel furnaces. The same kind of flues are used in the desilverization works, but they belong to their own system of condensation, and do not connect with the main flue. Some slight changes in these dimensions are occasionally made on account of local circumstances, but the size of the larger part of them is one square meter. The lower part of Figs. 1 and 2 have triangular projections, which have a base of two meters and are one meter high. All these pointed chambers have doors at the end of each incline, so as to make it possible to clean each pocket while the furnaces are in work. In order that the dust may not inconvenience the workmen while they are being cleaned, a sheet-iron pipe 40 centimeters in diameter is put underneath them. Into this pipe another one, which is conical at its upper end, fits loosely, so that it can be moved up and down. This is put under the triangular pocket, the cone shoved up under it, the door opened, and the dust allowed to fall down into a receptacle made for the purpose, without interfering with the workmen. Iron flues connect with these pocket flues and conduct the gases to the main flue outside the building. By this very ingenious contrivance the dust can be almost automatically removed from the flues, the cleaning of which would be more or less difficult or dangerous, without stopping the furnace, and a large amount of valuable material is taken at short intervals out of the gases before they pass into the main flue, where they would otherwise be obliged to lie until the end of the campaign.

The flues on the outside of the shaft-furnace building are of mason work. They have different sections according to the quantity of gas which they are required to carry off. These are shown in Figs. 4 to 9 and on Fig. 11. It has been found by experience that the arched flues, which at first characterized the whole of the construction, although of an excellent shape for resisting pressure from the outside, do not stand well against internal pressure, and that cracks are made in them so frequently that they are now being abandoned. The flue with rectangular section, Fig. 9, is not subject to these objections, and this style of construction is now adopted in these works and elsewhere in Europe. The roof of this flue is made of old rails covered with brickwork, and is inclined on the outside to one side, so as to shed the water. The cost of construction of this kind of flue is much less than when it is vaulted, and it has a much greater volume for the same hight and superficial area, and while it is just as likely to be acted on by the gases it is much more easily repaired. As it is much lower, the dust falling from the top falls from a less hight, and is not therefore so likely to be carried any great distance from where it fell. The cross section of the condensing chamber at Station 16 is shown at Fig. 10. The ceiling of this chamber is made out of old rails with cap bricks. Above this is a wooden roof made tight with pasteboard underneath the tiles. In every section of the flue, at convenient distances, man-holes are made for cleaning it out, and to facilitate repairs.

Up to the year 1877 the chimney shown at Station 22 was the one used for carrying off all the furnace gases. The flue used up to the year 1874 was torn down, as it was too small for the increased production of the works, and was replaced by a larger one, better arranged for taking off the dust. In 1874 a large chamber was built next to this chimney, but after some years it was abandoned on account of the large amount of repairs which were required, and the liable to heavy fines. A large amount both of volume and surface was thus lost at that point, but the surface was almost immediately regained by the system described further on. The chimney is shown at Fig. 13. It is 42 meters in hight above the socle, and its diameter is 2.47 meters in the lower part, and 1.80 meters above. As it was thought that this chimney might have a stronger draft than the proper working of the furnace would admit of, a movable damper was put in it (Fig. 13). On the outside a quadrant was placed; an arrow attached to the axis moving over the quadrant shows exactly the angle of the damper in the interior of the chimney. When every thing is working well, the angle is 45 degrees. Before the addition of the chambers, X and Y, it was as low as 27 degrees. The gas passes out of the main flue at *n*, by an elbow at Station 47, and enters the under part of the southern section of the condensing chamber building X (Fig. 12); it passes from that to the upper part of the same building, and then at *p* to the upper part of the northerly building, Y, then at *q* into the southerly part, and finally at *r* by an elbow, *r s*, enters a section of the main flue, which has been walled off just beyond the elbow *n*, and from there goes directly to the chimney.

FLUES, DUST-CHAMBERS AND FURNACES FOR COLLECTING FLUE DUST.

In the year 1877, the chimney at Station 47, and Fig. 13, was built, and connected with the flue leading to it on October 1st of that year. It was found necessary afterwards to increase the condensation surface, and on October 1st, 1880, the two buildings (X and Y, Plate I), and Fig. 12, containing condensing chambers, built beyond the chimney, were added to the flue. These buildings are 100 meters long. Each one of them consists of an upper and a lower chamber, with two divisions in each, separated by a flat ceiling which rests upon iron rails. When I visited the works in September, 1882, the whole of the upper part of the chamber (Fig. 12) had been put out of use, as the roof was leaking gas so badly as to render the works

chamber shown at Station 16 (in cut shown last week) and Fig. 10 was then built. It was thought necessary, at the time it was constructed, to make an arrangement by which it could be cleaned very frequently, whenever the works should increase their production, and to have a cut-off, shown at *b* and *k*, so that the gases might be made to pass beside it into the main flue while it was being cleaned. It was found, however, that the small quantity of dust collected made this unnecessary.

A number of experiments have been made to ascertain the temperature of the interior of the flues. It has been uniformly found that the temperature of the gases in the roof of the chambers was as shown in the table below:

At Station 15,	136° C
" " 24,	119
" " 35, at m	108
At entrance of last chambers, X, Plate I., and Fig. 12, Plate II	89
Coming out from the chambers, Y, Plate I., and Fig. 12	64

Although the sum of the sections of the two flues *ab*, *gh* is larger than that of the main flue at Station 16, they are not entirely filled with gas, and it is therefore not full, and consequently the temperature on the bottom is always some degrees lower than at the roof. The difference between these two temperatures is greater as the temperature of the gas is higher, and also as the hight of the flue is greater. At Station 15, where the shaft furnace flue joins the main one, it was found to be 8 degrees; at the entrance to the chimney at Station 47, it was found to be 2 degrees. The mean outside temperature varied during the days upon which these observations were taken, between 6 degrees and 10 degrees.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,
Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, etc.
Working Tests (practical) Made.
Plans and Specifications furnished for the most suitable Process for Working Ores.
Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

Assayers' Materials,

MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, ETC.

118 and 120 Market Street and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.
☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black H also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet · Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

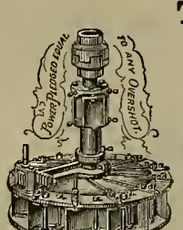
IMPROVED FORM

—OF—

HYDRAULIC GIANT

We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.



All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the

JOSHUA HENDY MACHINE WORKS,

49 and 51 Fremont Street, - - - San Francisco, Cal.

JAS. LEFFEL'S TURBINE WATER WHEEL,

The "Old Reliable,"

Witb Important Improvements, making it the

MOST PERFECT TURBINE NOW IN USE,

Comprising tbe **Largest** and the **Smallest** Wheels, under botb the **Highest** and **Lowest** head used in tbis country. Our new Illustrated Book sent free to tbose owning water power.

Those improving water power sbould not fail tn write us for **New Prices,** before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

GOLD QUARTZ and PLACER MINERS'

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

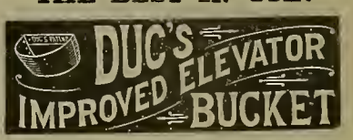
Old Mining Plates Replated. Old Plates bought, or gold separated for low percentage of result.

SEND FOR PRICE LIST.

SAN FRANCISCO PLATING WORKS,

653 & 655 Mission St., San Francisco, Cal

E. G. DENNISTON, Proprietor.



N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

THE BEST IN USE!

This is the only Scientifically Constructed Bucket in the market. It is struck out from charcoal stamping iron. No corners to catch. No seams to burst. No interior corners to clog up. It runs with great ease, and half the power of the old style bucket. WILL OUTWEAR HALF A DOZEN OF THEM.

PRICES REDUCED.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F

FOR WEEK ENDING NOVEMBER 20, 1883.

288,690.—CABLE GRIP—Benj. F. Carman, S. F.

288,696.—HARNESS CHECK HOOK—A. C. Dietz, S. F.

288,707.—WAGON-REACH COUPLING—R. Jacks, Meadow Valley, Cal.

288,947.—CABLE SWITCH FOR CABLE R. R.—A. H. Lighthall, S. F.

288,948.—TAKE-UP MECHANISM FOR CABLE R. R.—A. H. Lighthall, S. F.

288,646.—ROPE RAILWAY—J. B. Low, S. F.

288,653.—SANDAL—G. F. G. Morgan, S. F.

288,724.—ATTRITION MILL—J. J. Newsom, S. F.

288,740.—CARTRIDGE LOADER—J. B. Richardson, Mountain View, Cal.

288,879.—FRICTION GRIPPING DEVICE—A. B. Smith, S. F.

10,409.—MOLD FOR CEMENT PIPE—N. W. Stowell, Los Angeles, Cal. (Re-issued.)

288,743.—PEA SHELLER—Alfred Swingle, S. F.

288,745.—ORE PULVERIZING MILL—Wm. I. Tustin, S. F.

288,901.—ELEVATED WATER TANK—N. T. Whiting, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through DEWEY & CO.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

LIFTING-JACK.—Ira Rose, Salinas, Monterey Co. No. 288,367. Dated Nov. 13, 1883. This invention relates to that class of lifting-jacks in which hy means of a vibrating lever which operates pawls in engagement with a ratchet, said lever and its standard are raised. The invention eousists in a novel arrangement of the stationary ratchet standard with the sliding standard, whereby by the operation of the lever aud pawls the two are firmly held together and the jack rendered more rigid and capable of supporting greater weight. The object of the invention is to provide a simple, effective and strong lifting jack for wagons.

TELLURIAN.—A. C. Shaw, assignor of one-half to Geo. H. Fuller, S. F. No. 288,372. Dated Nov. 13, 1883. This improvement in tellurians is mostly in the detail of construction. One peculiar feature is that in order to produce the actual effect of day aud night upon the earth's surface as it revolves, to show the phases of the moon and produce the effect of an eclipse, the sun-globe is formed to two hollow sections, which may be separated or opened to admit a light. The rays of the light falling on the earth and moon will produce the effect of night and day, solar and lunar eclipses, and will always show the phases of the moon.

GANG PLOW.—Henry S. Palmer, Santa Ana, Los Angeles Co. No. 288,362. Dated Nov. 13, 1883. The improvements eousist in details of eoustruction, and the means for leveling and regulating the depth of the plows. The present ordinary construction of levers by which the cranks or crank-axle upon which the wheels are mounted or operated renders it often a matter of some difficulty to raise the plows out of the ground or regulate their depth. It is the object of this invention to render this operation easy.

FOLLOWER FOR RAM ELEVATORS.—Wm. R. Low, S. F. No. 288,352. Dated Nov. 13, 1883. This patent covers certain improvements in that class of elevators in which the eage or ear is elevated by what is known as ram elevators provided with follower-guides for steadying the ram spindle. The improvements include more particularly certain details of construction which strengthen, brace and improve the device.

CAR COUPLING.—E. M. Hobbs, Santa Rosa, No. 287,934. Dated Nov. 6, 1883. This invention relates to certain uew and useful improvemcuts in car-coupling, and especially to one patented Nov. 21, 1882, by the same inventor. The invention consists in an improvement in the connecting and coupling-pin, and in a guard for the externally pivoted link latch.

GANG PLOW—T. L. Grigsby, Yountville, Napa Co. Cal. No. 287,536. Dated Oct. 30, 1883. This invention is applied to that class of gang plows which are specially adapted for work in vineyards, cotton fields, and in all places where rows are planted. The invention consists in its means for connecting the plows with the frame, whereby they may be adjusted, and in a center plow aud the means for connecting it.

IF YOU WANT a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. CO., for "Lubrico." It is the best compound grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

Mining Share Market.

Dullness still prevails in the stock market. There is very little to report. The Ophir mine has bought the Morgan mill for $16,000, and it will be overhauled and repaired. A contract has been given to Senator John P. Jones for working the upper levels (all above the 1550-ft level) of the Consolidated Virginia and California mines. The contract is of the same nature as that given by the Belcher and Crown Point. Work will soon be commenced on the old works of the Con. Virginia and the California mines under this contract. At the Hale and Norcross they have been finding some very good ore to the northward on the 2700 level—ore that in former years would have caused quite a little jump in the stock. Fear of water prevents them crosscutting or going in such a direction as to cross the stratification. Therefore, until the new hydraulic pump is in operation, no good square prospectinge an be done. The big pump is completed, and it can be set up in ten days after its arrival, as the foundations are all ready for it. At Gold Hill the leading mines are extracting and sending to the mills the usual amount of ore. The Alta folks will have their 2150 level drained in a few days, and it will then be but a short time before they can resume active prospecting.

WHEN you feel life is a burden, and nothing you try seems to ease your dyspepsia, find a sure relief in Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Nevada.
I. M. LEHIY—San Bernardino and San Diego counties.
J. J. BARTELL—Santa Clara county.
C. E. CURTIS—Kern and Fiesno counties.
A. S. DENNIS—San Mateo county.
A. C. KNOX—Colusa, Tehama and Yolo counties.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and referenee library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Ageney. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class ageneies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

MORRIS
Improved Amalgamator
AND SETTLER.

Any parties having ore or precious metals in their tailings can procure my

Apparatus and Improved Method of Concentrating Ore and Tailings.

I will put my new and improved method in force on a percentage or sell it after trial.

FRED. MORRIS,
Metallurgist and Patentee,
(Room 34.) 320 Sansome Street, S. F.

WANTED.

A position as Mining Engineer or Metallurgist, by a graduate of a German Mining Academy, having had over 20 years' experience in the working of mines and treatment of all classes of ores; expert in concentration of ores. Apply to A. H., this office.

Tulare County Notes.

Mr. Geo. T. Buckland, the inventor of the patent spring buggy, was recently burned out in Tulare, but is rebuilding his shop with a fire-proof structure. It has hitherto done a good business in his specialty, and his new shop promises to be one of the substantial improvements of the town. On his farm, one mile from town, Mr. Buckland is engaged in building a reservoir 75x80 feet and four feet deep, using broken brick and cement for concrete. This will be supplied with water for irrigating by the use of three windmills and improved pumps. He will plant a forty-acre tract in vineyard and orchard and alfalfa, which will be irrigated by the means described.

An unusual interest is now manifested in agricultural and fruit land matters in this county, betokening a lively and advancing season. The great artesian belt, reaching from the rich Mussel Slough lands on the north to some fifty miles south, a little easterly, to Deer Creek, probably ten to twelve miles in width, is beginning to be better known and more properly appreciated. This belt borders Tulare on the west, and is largely tributary to this place for supplies.

The lands about Visalia, long known to be almost exhaustless in their richness and fertility, are becoming further supplied with water, and being better cultivated, proving to be among the most prolific in the State. If plentiful rains fall within the next two months Tulare County will leap forward with great rapidity, and we think realize permanent agricultural prosperity. It is our intention soon to give specially to our readers some very interesting information of this promising section of California.

Several English gentlemen are working a coal mine about twenty miles west of Huron, with favorable prospects, we understand. An air-shaft is being bored eight inches in diameter by B. F. Mull, of Tulare. This will serve to allow the gas to pass off. The shaft will connect with a tunnel, and will be enlarged to a working shaft by digging out from below, as in stoping.

The railroad repair shops at Tulare form a veritable oasis, being in a park of trees that have been planted. The favorably known master mechanic, Seymour Johnson, came there in 1875, when there was little but the dry plains to see. He expresses a strong belief in the future of the town. These railroad shops are the most important between San Francisco and Los Angeles. They handle the motive power from Latbrop to Mohave, and the volume of business is steadily increasing. The company uses ten 12-wheel engines in hauling over the Tehachapi pass, and some of them weigh 123,000 pounds, with drivers 54 inches in diameter. Some of these engines were made by the company, under the design and superintendence of A. J. Stevens, master mechanic, and others were made in the East. In the matter of repairs it seems that the work on the eastern engines is as ten to one on the home-made ones, which speaks well for the California-made ones; all being designed by Mr. S.

Mr. D. W. Madden, who has kept the Pacific Hotel since it was established in 1875, has proved himself one of the most useful of citizens of Tulare by his liberal enterprise in constructing water works, which supply the town with a remarkably fine quality of desirable water for drinking and other domestic purposes, and also for a good bathing establishment connected with the hotel. The well is an artesian one, 7 inches in diameter and 214 feet deep. The water is elevated to tanks in a neatly constructed and high tower, which is the most sightly architectural object in the vicinity. The water is pumped by a fourteen horse-power engine. The town is served through some four miles of pipe. These water works once saved an important part of the town from conflagration, and more recently saved the whole town from what might have been a very extensive fire. A good feature to be noticed is that free drinking-water is supplied through globe faucets all over the town. These works being due to the enterprise of a single individual, form certainly a praiseworthy feature of the town.

J. C. Smith's new artesian well, which he terms the "Great Wabash," is located seven miles nearly south of Tipton, in the southeastern quarter of Section 2, Township 22. The well is an 8-inch one, 550 feet deep, and gives a 5½ inch flow above the pipe. It forms quite a little creek, and the water from it has a perfectly sweet taste, being apparently free from sulphur and other minerals. It is on government land, located by Mr. Smith's daughter, who has secured most of the cash for boring the well by teaching school in the county. The well was bored by B. F. Mull, at a cost of $1,060. This is considered the best well yet secured in the belt, and was only lately finished. It is surrounded by some of the finest and smoothest land in the vicinity.

The Tulare Library Association rooms are attractive to strangers as well as useful to the residents. The building was constructed and donated by the S. P. Railroad Company. It embraces a large hall, for entertainments, balls, etc., reading rooms for gentlemen and ladies, sitting rooms, chess rooms, etc., furnished with a library containing valuable volumes for amusement and reference, billiard tables and other conveniences for recreation. Mr. Seymour Johnson, Master Mechanic at the railroad shops, is President of the Association, and takes a commendable interest in its welfare.

We acknowledge recent fraternal courtesies received from the enterprising editors and publishers of the Tulare press, including the *Delta*, *Times* and *Journal* of Visalia, and the *Journal* and *Messenger* of Tulare City. Also special kindnesses extended by numerous friends of our paper and enterprise in Tulare and Kern counties.

Failing!

That is what a great many people are doing. They don't know just what is the matter, but they have a combination of pains and aches, and each month they grow worse.

The only sure remedy yet found is BROWN'S IRON BITTERS, and this by rapid and thorough assimilation with the blood purifies and enriches it, and rich, strong blood flowing to every part of the system repairs the wasted tissues, drives out disease and gives health and strength.

This is why BROWN IRON BITTERS will cure kidney and liver diseases, consumption, rheumatism, neuralgia, dyspepsia, malaria, intermittent fevers, &c.

Mr. Simon Blanchard, a well-known citizen of Hayesville, Meade county, Kentucky, says: "My wife had been sick for a long time, and her constitution was all broken down and she was unable to work. She was advised to use Brown's Iron Bitters, and found it to work like a charm. We would not now be without it for any consideration, as we consider it the best tonic in the world."

BROWN'S IRON BITTERS is *not* a drink and does not contain whiskey. It is the only preparation of Iron that causes no injurious effects. Get the genuine. Don't be imposed on with imitations.

PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.
RANKIN, BRAYTON & CO.,
Pacific Iron Works, San Francisco. Chicago and New York.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.
120 in Actual Use.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

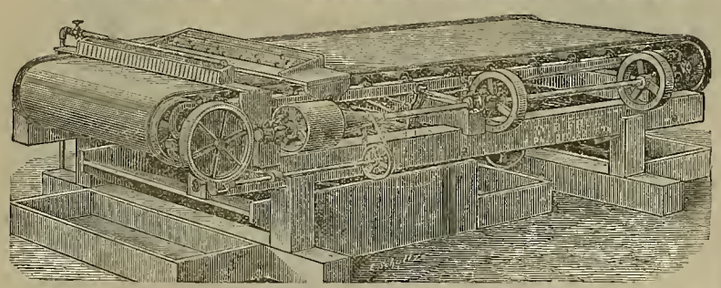
NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.



Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

The Bower-Barff Process.

The Bower-Barff process is intended for the preservation of iron and steel from rust by forming upon their surfaces a film of magnetic oxide. Mr. A. S. Bower, C. E. of St. Neots, England, submitted a paper on the process, before the American Institute of Mining Engineers this year, and from this paper we make some extracts. The father of Mr. Bower, some 16 or 17 years before made a series of experiments on the production of heating gases, one set of them being the decomposition of water by passing superheated steam through masses of red-hot iron. He noticed that the iron became less and less active until it ceased to decompose at all, when, on examining it, he saw that it was coated with a kind of enamel. It at once occurred to him, on seeing this, that the process in question might be used to obtain such a coating, but he found after a few days' exposure of the iron to the atmosphere, that the coating shelled off, and he pursued the matter no further. The iron employed in this case was rusty, but if it had been new my father would, in all human probability, have been the accidental author of the process which Professor Barff discovered ten years afterward. I only mention this to show how advisable it is to investigate the causes of unexpected effects. Professor Barff's process consists in subjecting iron or steel articles to the action of superheated steam, and when they are at a temperature sufficiently high, three equivalents of iron combine with four of oxygen, forming one equivalent of magnetic oxide, and setting eight of hydrogen free.

Upon reading a description of the Barff process in the London *Times*, it occurred to my father that what the Professor could effect with steam he might also effect with air, and several experiments were made to this end, which were very varied in character, as were also the results obtained. The first was made with cast iron, by placing the articles to be treated in a cast-iron retort, heated externally, and then passing superheated air over them; and it was successful, while nearly all others afterwards were quite the reverse, as sesquioxide was copiously produced as well as the magnetic. Another experiment was made by placing a bar of polished cast iron in the main duct of superheated air to a blast furnace, and this, though covered with a red sesquioxide powder easily brushed off, had a thin, but very firm and tenacious, coating of magnetic oxide in contact with the iron. This bar has been exposed to the weather ever since, or over four years, without the slightest appearance of rust. Ultimately, when thinking over the fact that air is oxygen and nitrogen in mechanical combination only, I came to the conclusion that, to form the lower or magnetic oxide, the quantity of free oxygen, and so of the air employed, must bear some proportion to the surface of the articles exposed to its action, more especially when a comparatively low heat is employed. This is so, and it has been proved that the quantity of air passed through the retorts during the most unsuccessful experiments was 300 or 400 times more than was actually necessary. The reasons also why the first experiment was successful were that a great number of articles were in the muffle, that a very high heat was employed, and that the retort had been previously used for coal-gas making, and had a deposit of carbon in it, which to a great extent neutralized the effect of the large excess of air. All the unsuccessfully treated articles were red with sesquioxide outside, but there was nevertheless a coating of magnetic oxide in close proximity with the iron, due to the reducing influence of the metal in contact with the sesquioxide at an elevated temperature. The general appearance, however, of iron so treated was disagreeable, to say the least of it. The mode of action I then adopted was to admit a few cubic feet of air into the retort at the commencement of every half hour, and then to leave the iron and air to their own devices, the retort, of course, being tightly closed. During each half hour a coating of magnetic oxide was formed, and the operation was repeated as often as was considered necessary. Effective as this was for cast iron, the cost of producing the coating was as great as by the Barff process, for both of them required that the chamber should be heated externally, and this, with the large furnaces, is very expensive. Another plan that I adopted was to first find out approximately the extent of the surface of the goods to be treated by first dipping them into a tank of water of known area, lifting them out, and noticing the amount of water taken out of the tank by the wetted surface, and regulating accordingly a slow, continuous air supply by meter, of course keeping the temperature of muffle as nearly constant as possible. This, too, was successful, but the same objections applied to that mode of procedure as to the other.

The engravings on this page show two views of the furnace used in the process. Fig. 1 represents a longitudinal section. Fig. 2 is a transverse section. We shall give other views of the same furnace in the next issue of the PRESS. The hopper *b* supplies the producers for gasifying the fuel. The carbonic oxide from the combustion of fuel in the producers, passes along a conduit *d* (its flow being controlled by a slide *e*), to the openings *e*, where this combustible gas meets a current of hot air ascending through a passage *f*, and is consumed. The products of combustion are thence conducted along a passage *g*, where they are thoroughly mixed by open brick-work cross walls *h*, and then return along a passage *i*, whence they enter, through the oblong holes *l*, the chamber *k*, in which the articles to be coated are arranged. After having passed over and among the articles to be coated, the waste escapes downward through ports *m*, into regenerator chambers *p*, and thence to the chimney flue, heating in its passage the tubes *t*, composing the regenerator, and which are securely supported by the cross walls W. Cold air enters the apparatus at *r*, through a channel provided with a regulating valve under the control of the furnace tender. This air then passes along the lower rows of regenerator tubes and back through the upper tubes, thus becoming highly heated by the waste gases, and capable of developing greater heat when burned with combustible gas.

Manufacturers' Association.

The Board of Directors of the Manufacturers' Association of California held a meeting this week, and reports read then show that twenty-two persons who signed the call for the formation of the Association have signed the by-laws, and nineteen have paid the initiation fees and dues, and the others who signed the call are expected to become members. Entrance fees have been collected amounting to $380, initiation fees reaching $125, and there is a cash balance of $391.40, the expenses reaching only $113.60. The Executive Committee are making a systematic canvass for members. The Chairman, Irving M. Scott, Vice-President of the Association, who presided in the absence of President A. S. Hallidie, thought that a more vigorous canvass should be made, and that 200 members should be secured in the next few months. On motion, the Judson Manufacturing Company, the California Iron and Steel Company, and the glove firm of Lippit, Leak & Co., were elected to membership. Mr. Scott said: "Some manufacturers are opposed to us, and consider this Association a clique who are going to run things to suit themselves, independent to the Board of Trade or other organization. I deny this most emphatically. We have no clique, and want to extend our membership as far as we can and include reliable firms."

Mr. Haraszthy favored these sentiments. The Association must not encroach on the rights of the Board of Trade, and care should be taken to this end.

In the discussion that ensued it was declared by one member that the Board of Trade was the most efficient organization of the kind in the world. It was thought by most of the members that mercantile ratings and such other questions as belong exclusively to the province of the Board of Trade should be scrupulously avoided by the Manufacturers' Association. At the next meeting a proposition will be taken up to allow all firms elected to membership to speak in open meeting, but each firm shall have only one vote. This plan was partly discussed and left for a meeting of the full Board of Directors.

THE Pacific Coast Steel and Iron Manufacturing Company has made a proposition to the people of Martinez, Contra Costa County, to establish works there if the town's people will take $100,000 of the $250,000 of the company's stock, to be paid for at the rate of $50 per share. It is the claim of the Pacific Coast Steel and Iron Company that it has a new process for the manufacture of the best grades of steel at very much reduced rates.

A NEW manufactory of flint glass has been established in San Francisco. The furnace will be ready in January, while blowing will commence in February.

CORRESPONDENCE.

Parley Park District, Utah.

[From our Traveling Correspondent.]

The Parley Park mine is considered an extension of the Ontario lead, and near by. This is under the superintendency of C. J. Nelson, and is owned by wealthy men of Pennsylvania who are members of the Pittsburgh Standard Oil Company. They feel assured they have here a mine, and have erected a steam hoist, have run their double-compartment shaft 965 feet deep, tapping the ledge at intervals as they descend, and find it dips at an angle of 70 degrees. They have very little water, as the Ontario has been disposing of that. They are working 25 to 30 men, making three shifts in 24 hours.

The Marsac S. M. and Mining Co., also in Park District, was organized in 1873, under the mining laws of Michigan. They labored under many disadvantages as distant owners and not able personally to supervise the initiatory works of the company.

In 1874 they expended nearly $100,000 in erecting a mill, expecting to get a supply of custom ore, which for various causes did not come forward, and their own properties were not then producing milling ores; so the mill was mostly idle till leased by the Ontario Company in 1876 and used by them over a year.

Since 1878 Mr. E. P. Ferry, from Michigan, has had charge of the entire property as Superintendent and President, residing at Park City, which town site is part of the Marsac land property; and thus enables business men to secure good titles to their business lots before erecting costly buildings. Mr. Ferry seems to be highly esteemed for the interest he manifests in the community affairs of the city, and his efforts to advance his own company's enterprises. He has thoroughly improved the mill, which now is described briefly as a 30-stamp dry crusher, 150 horse-power engine, 10 pans, 5 settlers, etc. A 60-inch Howell rotary roaster has a capacity of roasting 40 tons per day. The assay office, etc., complete; there are also carpenter and blacksmith shops, stable, and a good commodious business office. The mill is not now running. They expect to start it July, 1884, when they get their mine of free-milling ore more perfectly opened; but at present they are doing strong work on the Crescent mine, which is about 2½ miles from town. From this they are taking out daily 60 tons of ore, which is sampled and sold here to the smelters. They have shipped a large amount to the Castle Dome smelters, some to the Melrose works, California; and the Salt Lake and Omaha smelters also purchase.

During the last year they have taken out over 10,000 tons, worth at the mine $305,000. From this they declared a dividend of $150,000, besides making a large amount of permanent improvements in buildings, tramways, etc, this being the first year of its production. These are certainly very encouraging figures, and at the annual meeting, no doubt, the numerous stockholders will rejoice in a neat little dividend, and what is better still, a very satisfactory report of development work that means much better dividends in the future. The report will tell of three and one-half miles of tunneling in the mine, all connecting by shafts from one level to another. This vein is a blanket one, dipping eighteen degrees to northwest, with an average thickness of fifteen to twenty feet. The distance from the Marsac mine to the railroad depot at Park City is three miles. There are ninety-five men now working in the mine. These and many other little items that an outsider can not get will enlighten the stockholders at their annual meeting. I found the mining foreman, Mr. E. Porter, a practical business man as well as miner, and appreciated his hospitality, and took a miner's dinner in the miners' dining room; and if I am not mistaken, it was equal to Salt Lake's first-class hotel. The assay office is occupied by a very competent young man.

The Barry Consolidated Mining Co.

Was incorporated on October 12th, with a capital stock of $2,500,000. The claims are north of the Crescent mines. G. J. Barry, of Park City, C. B. Rustin, of Omaha, Joab Lawrence, et al., are owners. There are nine claims consolidated. The development capital is already paid in, and judging from the character of the incorporators, this means business. These Wasatch Mountains have many more undeveloped mines awaiting capital. On the same elevation or range is the Silver Key, working fifteen men, Dr. Furguson, foreman. They are not now shipping any ore, but are opening the mine more thoroughly.

The Apex Company is working twelve men, and selling ore in Salt Lake through the sampling house of McIntosh, Salt Lake.

Utah did her mines great credit in sending a very large and fine collection of ores and other mineral specimens to the Denver Exposition, under the care of Prof. Clayton, who arranged them with excellent taste. Since the organization of the

Mining Bureau of Salt Lake

They have made provision to start a permanent cabinet as the property of the Bureau, and have returned their specimens from Denver as a nucleus for a very full cabinet. They aim to collect the best scientific works and periodicals for their library. This organization is a movement of Utah's best business men, such as J. R. Walker, of Walker Bros., Joab Lawrence, Mr. Erb, of the Walker House, Prof. J. C. Clayton, and others, who recognize mining as a legitimate business, and as such is worthy of the best assistance that business tact and science can render it. The denunciations and anathemas that are heaped on

Mining as a Business

To-day comes almost entirely from those wholly unacquainted with the whole subject of mines—largely too from those who rush to every new camp with a small trunkful of socks and overhauls, with a few other cheap notions, and soon declare they have lost $10,000 by mining excitements, and they don't want to put any more money in mines. There are many men in Salt Lake City and in the mines of Utah that stand high in good moral and business society, who have no sympathy or liking for those who denounce and discourage this enterprise, that actually creates wealth in its most useable form from the worthless rocks of the mountains. It produces it as the common equivalent of all properties.

If man's necessities and the fertility of the soil argue for farming, why will not man's necessities and the mountains' abundant stores of wealth invite him as cordially to dig there as earnestly as in the potato field? I hear the objector say, we can raise potatoes without study, but to mine I must work hard with both mind and body. Legitimate mining is now and has ever belonged to and made a part of higher civilization.

While visiting the Iron and Steel Works of Colorado, employing an army of men and boys with blackened faces, none will fail to recognize the connection of their labors with our every advancement; or if you get on the Ontario Co.'s coal train and visit the Wasatch Coal mines, 18 miles below Park City, you will find 40 men working, aided by two steam hoisting works, and though all covered with coal dust you will find them a good average of intelligence and civility; and as you return to the well warmed hotel stove you can better appreciate the utility of that branch of labor.

"Park City and Environs"

Are highly favored in having an abundance of choice coal, very cheap; and I noticed many near the coal mines were simply going to the slack or waste piles dumped along the railroad track, and screening and loading up wagons with choice small nut-size coal, free.

Park City has a population perhaps of 1,500; has an excellent school, with male and female teachers sent out by the Chicago Educational Society, and make tuition free where parties are unable to pay. There is a Catholic and a Congregational church, a good hotel, and withal it is a town that does a nice lively business, and when the mines are developed will be much increased in size. The U. P. R. R. connects Park City with main overland route, giving that vicinity great convenience for development.

B. W. CROWELL.

Saving Snake River Gold.

The gold placers which exist along Snake River from near its headwaters to where it empties into the Columbia have for years attracted the attention of placer miners, but the fine gold has perplexed both miners and inventors to find a way to save it. One contrivance after another has been tried, only to be found nearly, if not quite, worthless. A new invention is now announced which gives promise of greater success. The Blackfoot *Register* has this in regard to the new method: "At last a machine for saving fine gold has been invented and put in successful operation at this point by Mr. D. O. Crane, of Washington, D. C., which works to perfection. It consists of a copper cylinder twelve or fourteen feet in length, with a rotating shaft extending through the entire length. Attached to this shaft at regular intervals are wings or blades, so arranged that the sediment in passing through is divided into thin sheets, exposing it to the surfaces of the wings and interior surface of the cylinder, all of which amalgamated, in fact the entire interior surface of the machine, wings, shaft and interior surface of the cylinder being thoroughly quicked. The shaft in rotating divides the sediment, besides washing it against the sides of the cylinder, bringing the light gold in contact with the amalgamated surfaces, where it is secured.

In making a test near this point Mr. Crane ran the tailings of the machine over burlaps, but not a color of gold could be found upon them, proving conclusively that the machine saved every particle of the gold from the dirt passed through it. Instead of being exposed to one surface, as on the ordinary plates, in this machine it is not only exposed to many surfaces but by the motion of the wings is thrown against the interior surface of the cylinder.

The machine is without doubt a perfect success, and will be the beginning of a new era in mining along Snake River. In the coming spring Mr. Crane and his partner, Fred T. Dubois, U. S. Marshal for this Territory, will place several machines along Snake River, which will add materially to the interests of those concerned in mining operations, and be of substantial benefit to the towns adjacent to Snake River."

Morris' System of Gold Amalgamation.

Mr. Frederick Morris, of this city, who has patented a combined amalgamator and settler, has devised a system of gold amalgamation, using his appliance, a description of which will be of interest. The machine is a combination of the ordinary pan and settler. It consists of a circular wooden tank, probably seven feet in diameter, with wooden dies and mullers, the grain of the wood running vertically face to face, and of a central discharge. Amalgamation of the gold particles with mercury is effected merely by rubbing the pulp and mercury gently together. This supplies the friction referred to further on in paragraph three. When amalgamation of the gold particles with mercury is effected, clean water is introduced into the settler and drawn off through the center post. This method saves float gold, spongy amalgam and floured mercury, claimed to be lost in the ordinary settler, in which the discharge is not at the center of the tank, and when iron bottoms and dies are used.

When a charge is drawn from the outer edge of the pan into an ordinary settler, a large proportion so drawn has never been to the bottom of the tank, and as the pan by grinding the pulp liberates certain base substances, by reason thereof the gold particles of floured mercury do not collect at the bottom. Now take the reasonable principles of Morris' theory and settler. 1st. When the charge is in and the gold particles amalgamated with the mercury water is introduced and is discharged through the holes in the center post until the water flowing off is quite clear. By the reason of an eddy formed at the center, all the base substances liberated by friction would be carried off by pure water, leaving the gold particles and mercury free to go to the bottom; as it is not possible for the gold particles or floured mercury to go from the outer edge to the center they must pass to the bottom, and by coming in contact with the wooden bottoms and mullers, the mercury is formed into bead and sinks into the grooves between the dies, and is not cut up as is usually done by the ordinary settler with smooth bottom, where the mercury is continually rubbed and cut up, not alone by the mullers, but as there is always some coarse stuff that has not been subjected to grinding, and will accumulate from each charge, that stuff, from its coarseness, is the very worst to cut up mercury and grind the amalgam, whilst the Morris settler has grooves or receptacles for the amalgam and mercury. In this machine any kind of chemicals can be used, as it is made of wood. In an iron vessel strong alkalies or acids can't be used to an advantage, as it will act on the iron before it acts on the fine particles of gold or mercury.

Mr. Morris' circular, from which these statements are taken, advances the following:

Theory of the System.

(1.) Gold is mechanically, not chemically, combined with any of the substances found therewith.

(2.) In a matrix inclosing sulphides of iron, arsenides, decomposed sulphurets, or "rusty gold," as is the case in most all gold mines, the gold particles are coated more or less with a film of oxide or tarnish, which prevents dried amalgamation with mercury. The gold particles may seem bright and clear to the eye and yet be coated. Therefore I would say to parties doubting my theory to try two pieces of bright iron. Subject one to a redhot shovel for five minutes and then throw both into mercury, and it will be found that the one heated will not take quicksilver. And why? Because the one heated has acquired a coating or tarnish of oxide of iron, neither of which is perceptible to the eye.

(3.) Stamping may abrade or remove the tarnish from a limited portion of the gold particles which may be present in a lot of pulp, and render the brightened particles free to amalgamate with mercury. But further friction will be necessary to remove the tarnish from the remaining particles, which usually constitute the larger proportion of the gold liberated in the ore.

(4.) It therefore only remains to "fine" stamp the ore without mercury in the mortars, concentrate and apply some rubbing friction with mercury.

(5.) The gain in friability, by subjecting pyritic ore to weather oxidation, is more than counterbalanced by the increase of tarnish on the gold particles, which makes amalgamation more difficult. The fresher the concentrates or tailings, the more rapid will be the amalgamation.

(6.) Iron rubbing against iron, as in iron pans and settlers amalgamation, ought to be avoided, because it tends to flour the mercury, and the chemical action, slight as it may be, set up between sulphides and metallic iron increases the tarnish on the gold particles, which tarnish must be removed before the particles amalgamate with mercury.

Concentration is the next question to be considered. There are many machines in use; but those mostly employed are the "Frue" and "Hendy" concentrators. * * * * The superintendents usually have no milling knowledge. They do not care how much precious metal is lost, and generally speaking the stockholders do not care as long as the superintendents send in dividends. But as soon as the ore becomes poorer and more expensive to mine, then the shareholders open their eyes and look for some one to work their sands or sulphurets. If he should earnestly endeavor to succeed all kinds of obstacles are put in his way, in order to force him to leave, as the employers have an impression that the millman will make too much money. Generally speaking, however, it is not the shareholders or directors who throw obstacles in the way of the millman; on the contrary, they are probably sorry to lose a man of the kind, because they may say if he can make money for himself he will make more for us. But as regards the superintendent, his thoughts will be, if that man can not be got rid of the shareholders can not help seeing my ignorance and incapacity.

(8.) As regards concentration, I would say my way would be to concentrate the gold instead of the sulphurets; to that end is my aim. My concentrator will concentrate concentrates to high standard, so that any method will pay to extract the gold. Generally speaking, a concentrator is valued according to how much sulphurets are saved. But as we have in many localities very poor concentrates, there my method would be of incalculable value. Take for granted what I say in paragraph 1 and paragraph 4. The gold can be recovered by my method 90 per cent. No skilled labor is required; therefore I will do away with the expensive graduates of "Freiberg or any other school of mines." It only requires good, practical, common sense men to make a success. I will undertake to concentrate tailings after any concentrator or machine that assays one dollar per ton, and make a profit ont of them. I am satisfied that the tailings from all the mills run contain an average of $2.50 per ton. By my method forty tons can be reduced to ten hundred pounds, and ninety per cent of the assay value of gold in the ore treated can be recovered by simple and cheap mechanical appliances.

(9.) "Chlorination" means an expensive process for extracting gold, and for silver it is impracticable. In order to extract the silver another process must be resorted to, namely, "Lixiviation." If silver and gold ore is treated in a furnace, and salt used to convert the silver present into a chloride, the soluble chloride can be extracted by lixiviation; therefore, it is necessary to first roast and lixiviate the ore in order to obtain the silver, then to extract the gold by chlorine gas. The most extensive chlorination works in the world are situated in Nevada County, California, where every skill and economy is used. The cost is not less than ten dollars per ton of 2,000 lbs.; now add five dollars per ton more for cost of lixiviation, then take the cost of concentrating one ton of sulphurets (concentrates). This will cost five dollars more, or a total of twenty dollars per ton of 2,000 lbs; then take 90 per cent of the assay value as the amount of gold extracted; it follows, therefore, that the stuff must be worth twenty-two dollars per ton of 2,000 lbs. to pay expenses.

Comparisons of Results.

Mr. Morris continues: Ordinary iron amalgamating pans (small ones) cost at least three hundred dollars each. They are expensive to set up, and wear out rapidly. The weight of the parts renders their use impracticable in mines difficult of access. Each pan also requires over five horse-power to drive it. In addition, two amalgamating pans are always worked in connection with a single settler, thus rendering the amalgamation and getting rid of the pulp two distinct operations. The Morris amalgamator and settler can be easily made at the mines, no matter what their position may be, at less than one-half the cost of an iron pan alone, while its durability is much greater. The wooden dies and shoes can also be quickly replaced at any time. About one-half horse-power is sufficient to run one machine and to treat three tons per day of twenty-four hours. The following table shows the relative quantities of gold obtained by the use of different gold-saving appliances:

	Assay contents of gold.
Morris' combination pan and settler	90 per cent.
Ordinary pan and settler	70 per cent.
Amalgamating barrels	72 per cent.
Tyrolese or Hungarian mills	70 per cent.

There is, therefore, no inducement to incur the expense and waste of power incident to the ordinary California pan and settler, nor the loss of gold consequent on the use of the pan, barrel or chloriuation systems.

HOW TO LOOSEN A TIGHT SCREW.—One of the simplest and readiest methods of loosening a rusted screw is to apply heat to the head of the screw. A small bar or rod of iron, flat at the end, if reddened in the fire and applied for a couple or three minutes to the head of the rusty screw, will, as soon as it heats the screw, render its withdrawal as easy by the screw-driver as if it was only a recently inserted screw. As there is a kitchen poker in every house, that instrument, if heated at its extremity and applied for a few minutes to the head of the screw or screws, will do the work of loosening, and an ordinary screw driver will do the rest, without causing the least damage, trouble or vexation of spirit. In all work above the common kind, where it is necessary to use screws, and particularly in hinge work and mountings, fancy fastenings and appliances affixed to joinery or furniture work, we would advise the oiling of screws or the dipping their points in grease before driving them. This will render them more easy to drive and also to withdraw, and it will undoubtedly retard for a longer time the action of rusting.

MECHANICAL PROGRESS.

Wire Cloth for Lathing.

Various forms of metal have been used at different times as substitutes for wooden lath, among which may be mentioned wire cloth, which has been extensively introduced. One of the chief claims of this material to favor is that by its use wooden buildings can be rendered practically fireproof. Cast and wrought iron beams and columns in building construction, unless they are thoroughly protected from the action of fire, are not to be depended upon. A comparatively low heat renders them useless, and in many cases buildings are thrown down by the expansion of the metal and the sagging of heavily loaded floors at a very early period after a fire breaks out. It is well known that firemen will refuse to enter an iron building for the purpose of fighting a fire, while they will contest the progress of the flames step by step in a building having wooden columns and floor beams. Since iron, to be entirely serviceable, must be incased in some non-conducting material, and since in many cases equally as satisfactory results are obtained from wood similarly protected, and withal at a much lower first cost, it follows that the use of wood in this general manner is becoming very common.

One of the best protectors of wood is mortar, and, accordingly, some methods by which the mortar can be held in place during the action of intense heat is a prime essential. Wire cloth used as lathing has been demonstrated by repeated trials to be satisfactory for the purpose. The particulars of a test recently made in New York, on the site of the old *World* building, may be of interest to our readers. A small building was erected, with walls of brick. It was covered with wooden beams, and common wood furring-strips were run crosswise, to which was fastened the wire lath. Two coats of mortar were applied in the usual manner and allowed to dry. On the day appointed for the trial a very hot wood fire was kindled and kept to the highest point for two hours by frequent replenishing. The fire was then allowed to go down, to facilitate investigation. It was found that the second coat of mortar, which had been artificially dried, had scaled off, but that the scratch coat was intact, not even a crack being visible.

The original intention was to have ended the test at this point, but it was determined to proceed to a still severer trial. Accordingly, the fire was again built, and wood was supplied for forty-nine minutes longer, the fire burning on the second trial for an hour, making in all something over three hours, during which the ceiling was exposed to a more intense heat than would ordinarily be experienced in a burning building. At the end it was found that the plaster had fully protected the wooden beams, demonstrating that the employment of wire lath will serve to confine a fire to the apartment in which it originates. The further claim is made that ceilings in which it is used will not crack, and that therefore it is specially adapted for fine work. It is used in the buildings erected by the Astor and Stewart estates, and employed in the Vanderbilt residences.—*Iron Age.*

A COMPOUND LOCOMOTIVE ON THE BOSTON AND ALBANY.—The adoption of the compound engine by ocean steamers a few years ago, and the resulting economy in fuel, set railroad men to thinking whether a similar plan could not be utilized for locomotives with profit. As a result, Henry Dunbar, of Hartland, Vt., has invented a four-cylinder, high-pressure freight engine which is expected to cause a saving of 33 per cent in fuel. The engine is now being built at the Boston shops of the Boston and Albany road and will soon be tried. It is an adaptation from a three-cylinder engine, invented by Mr. Webb, of the London and Northwestern Railway. In the Webb engine there was a large cylinder 26 inches in diameter directly under the smoke-stack, and on either side of this were two high-pressure cylinders 11½ inches in diameter. The Dunbar engine does away with the center cylinder, and has two 26-inch cylinders, each arranged in connection with a smaller one so that the latter shall exhaust into the larger, and thus utilize the steam a second time. The cylinders are so fixed that live steam can be used in all of them at the same time, thus giving an immense power; but the chief object is to utilize the exhaust steam. There are really two engines, independent of each other save so far as the rails may be said to couple the four driving wheels. The boiler will be so large that the engine can carry 160 pounds of steam, as do first-class passenger locomotives; but the drivers will be only 4½ feet in diameter. The machinery is the same as that of an ordinary engine, and if four cylinders fail to do the work expected they can be taken out and one pair put in. If, however, a saving of 10 per cent in fuel is effected, the engine will be voted a success.—*Springfield Republican.*

STEAM BOILERS.—A steam boiler, to produce economical results, should be constructed and set so as to permit a free combustion of the fuel and give sufficient volume of space for the hot gases to combine, in a manner calculated to effect the utmost production of heat due to the fuel consumed. Combustion of fuel is the chemical combination of the substance of the fuel with the oxygen of the air. A mechanical mixture is a composition in which the ingredients retain their natural properties; steam is a mechanical mixture of heat and water; atmospheric air is an invisible gas, produced by the mechanical mixture of two other gases, viz., oxygen and nitrogen. A chemical combination is an action in which certain elements and substances are absorbed and destroyed in the production of some other element or substance. Heat is a product of the chemical combination of the element oxygen with a combustible substance; and to produce the maximum volume of heat from a given weight of fuel, it is necessary that a proper quantity of oxygen, under correct conditions, be admitted to the furnace and combustion chamber. The maximum rate of heat having been provided for, the surface of the boiler exposed for its operation should be of sufficient extent to allow the necessary time for transmission of heat to the contained water. When the heating surface is insufficient, the heat is certain to be carried through the flues or tubes and into the up-take before it (heat) can be absorbed to an economical extent. There must be, also, ample room for the escape of steam to the surface of the water; and after it has passed above the water it would seem as though it was necessary to bring it (steam) again in contact with some heating surface to thoroughly complete the evaporation and even superheat the steam slightly before it is finally allowed to pass to the engine.—*American Locomotive Engines.*

COTTON BELTS.—An advocate of cotton belts says: "Woven belts give and take. This is the nature of a woven material. When first put on, they require 'taking up' once or twice more than leather. The stretch is approximately six per cent as against four per cent in leather; but once well to work they give less trouble, as there is but one joint to look after. If put on really tight enough, this stretching is minimized to a great extent. Users are afraid to overstrain the belt, but the extraordinary result attained by certain experiments made as to tensile strain shows the impossibility of breaking a belt under fair conditions." The capital advantages claimed for the transmission of power by means of belting are intensified, as it were, by the use of woven bands. Thus, with gearing we have cumbrousness, noise and vibration; disaster following upon an obstruction or breakage in the machinery, and unsuitability for high speed. Such liabilities are avoided by the use of leather belting to some extent, but very much more so if a belt less cumbrous than leather, less weighty, working more quietly and smoothly, with more elastic stretch to sustain a sudden shock, and more suited, owing to its extreme pliability and light weight, to high speeds. In the use of belts it will be found to be much more effectual and satisfactory to decrease their tension and increase the diameters of the pulleys or width of belts rather than run them too tight. More than one instance could be chronicled where as high as 15 per cent of the power used was consumed in overcoming friction caused by tight belts.

NEW DEVICE FOR GENERATING STEAM.—Late English papers speak of a new device for generating steam, which is described as follows: The device is a smokeless locomotive driven by steam, but without any fire. The inventor is the engineer Honigmann, in Grevenburg, by Aix-la-Chapelle. His system consists of a double boiler, the larger one being filled with fresh water, and inclosing a smaller one filled with a solution of salt. If now the water is heated to 145° cels., the engine has a working pressure of three horse power, and when it is put in motion the exhaust steam will enter into the solution of salt, where it leaves its heat, which again produces steam until the solution is saturated with water, and therefore unable to retain the heat. Such an engine is capable of working during four or five hours without giving off smoke, and it is said that in many instances it will in consequence rival the electric locomotive.

WOOD-WORKING MACHINERY.—The manufacture of wood-working machinery has developed at a wonderful rate during the past ten years. Where, formerly, the business was mainly confined to a number of large concerns, there are now a great many small establishments engaged in the business. It is safe to say that no line of machinery has made greater strides towards perfection than this, and many of these small establishments will probably ere long develop into wealthy corporations. The manufacture of lumber and its subsequent manipulation are properly recognized as among the leading industries of the United States.

THRASHING BY SUN HEAT.—A French inventor who has patented a machine for the use of concentrated solar rays as a general motive power, has set up three of his machines in Algeria for the French government. He is now carrying on experiments at the Island of Porquerolles, near Hyeres, in France, where he is thrashing Indian corn and raising water by the action of the sun's rays.

BAND SAWS DODGE.—They can be made to bear a great number of the moderate flextures required by sufficiently large wheels, and can be guided very successfully at the points of entering and emerging, but no practicable amount of skill can make them saw in absolute planes through thick and knotty wood.

SCIENTIFIC PROGRESS.

Astronomical Collisions.

An article in a late number of the *North American Review*, by C. A. Young, Professor of Astronomy at Princeton, N. J., presents some interesting points in regard to the probability of collisions between worlds. It contains a good many statements of fact with which the ordinarily intelligent reader should be familiar, but they are well selected to bear upon the subject which has agitated so many minds as a result of unauthorized predictions by some and overdrawn deductions by other persons who have written on the topic. He says that while the possibility of collision remains, the chances of two stars accidentally jostling each other is far less than that of the collision of two bullets in mid-air over a battle-field. The average distance from star to star, throughout the range of the region commanded by the telescope, is about 9,000,000,000,000 miles.

If ever two great worlds should really meet in this way, some of the consequences can be predicted. If, for instance, our earth should meet another globe like herself, and moving with the same velocity, heat enough would be generated by the shock to transform both into a huge ball of vapor. Unless the central core of the earth is much colder and more refractory than usually supposed, the quantity of heat developed would be sufficient to completely vaporize a globe of ice 97,000 miles in diameter, containing 160,000 times as much matter as both the colliding worlds. If, however, the masses were chiefly gaseous to begin with, as our sun seems to be, the effect might be curiously different. Heat would be generated to just the same extent as in the case of solid bodies, but the result in nebula might be actually cooler than was either of the bodies before the encounter, owing to an immense expansion in volume, though immediately after the shock, and before the ultimate expansion in bulk was attained, the temperature and brilliancy of the mass would for a time vastly increase.

In regard to the consequences of a comet's collision with the earth, it is impossible to predict them with scientific certainty; but they would probably be insignificant. The quantity of matter in a comet is small; it is probably, throughout, only a cloud of dust and vapor—a mere smoke-wreath—and has not any solid kernel as a nucleus. If, however, the comet has really at the center of its head any great mass of stone or iron, or even a closely packed swarm of aerolites weighing a ton or two each, collision with it would be a very serious matter, spreading devastation and conflagration over perhaps half our globe surface at once; not amounting probably to any thing like a destruction of the world, but far more disastrous than any earthquake or volcanic eruption. It is far more likely, however, that the encounter with a comet would simply cause a magnificent but harmless shower of shooting-stars, lasting an hour or two, which one might desire to see.

As for the effect of a collision between a comet and the sun, the probability is that we should never know of it unless we happened to be expressly watching the event. For a few minutes, just as the nucleus was piercing the photosphere, there might be an unusual flash of brilliance and a fine outburst of solar prominences, followed by intense magnetic and auroral displays on the earth. But the chief thermal transformation of the impinging energy would be effected far below the visible surface of the sun, and would result in an expansion of his bulk far too slight to be detected by terrestrial astronomers.—*Chicago Tribune.*

CLOUD INDICATIONS.—Some of the oldest text books, or the reading books of the present mature generation, show by text and illustration the shape and proportional construction of clouds, giving their names; as, the *cirrus*, *stratus*, *cumulus*, *nimbus*, and their names compounded. A recent contributor to our cloud knowledge is an English meteorologist, Rev. W. C. Ley, who has initiated the appearance of the clouds as a study, by means of photography. He claims that by observing cloud forms he can predicate rain from the surface of a cloud which may be forty miles away. His plan comprehends the material as well as the forms of clouds. The *cirrus* is an ice cloud, sailing at an altitude of from three and a half to seven or eight miles above the general surface of the earth, and with a very high velocity, at times exceeding that of a locomotive. The icy structure of the upper clouds is evidenced, not only by the fact that at the levels on which they move the temperature must be extremely low, but by the fact that the halos and mock suns, formed by *cerri*, can not be explained in accordance with optical laws, except on the hypothesis that the light is refracted through minute prisms of ice. "Outlying streaks of this cloud, often from twenty to one hundred miles in advance of the main pack," he shows, serve as "the pioneers of the coming army"—those alternated threads of ice crystals, between five and eight miles above the earth, arranged in parallel lines, gradually overspreading the sky with a milky-looking film of whitish cloud matter. This stage occurs at a place lying in the storms' track before the barometer gives any warning, and sometimes while the mercury in the weather-glass is rising. Thus the trained observer may consider these clouds as storm signals, advertising by their peculiar movements not only the coming of the storm but also the bearings of its center.—*Scientific American.*

MEN AND ANIMALS.—We are distinguished from the animal creation by the magnitude of the brain, by the complication and perfection of the nervous system; and the whole force of life, its emotional force, its thought force, its will force, resides in the nervous mass of the brain and in the nervous system of the body; and he who keeps that healthy is competent to all the functions of existence, and he who draws on that draws on his capital. A healthy nervous system is one in which every night a man makes up what has been expended in turning the wheel of industry through the day: is one in which food and sleep make up, every twenty-four hours, all that a man has wasted, and supplies some surplus. There are a variety of ways in which men draw off the vitality of their whole brain and nervous system. Excessive virtuous industry does it. It makes no difference whether a worm eats its way into a wooden cistern or whether a hole is bored into it with a gimlet, or whether heat shrinks the stuff, its contents run out all the same; and no matter what it may be, any thing that sets the nervous system afoot will drain it dry speedily, and leave a man a wreck. As soon as a man has wasted with riotous living the substance that lies inside the brain and nervous system he is good for nothing. That is the vital part of every human being: it is the capital of a man's life, and when one has squandered that he is beggared and bankrupt beyond all description. The first thing we know, down goes one man paralyzed; down goes another man from softening of the brain; down goes another man with Bright's disease.—*Henry Ward Beecher.*

A REMARKABLE ELECTRICAL DISCOVERY.—The London *Times* of August 31st states that a new electrical contrivance has been perfected by Mr. A. St. George, the inventor of the telephone which bears his name. This invention, which is really supplemental to the telephone, will enable every description of conversation carried on through the instrument to be not only recorded but reproduced at any future time. Briefly stated, Mr. St. George's invention may be thus described: A circular plate of glass is coated with collodion and made sensitive as a photographic plate. This is placed in a dark box, in which is a slit to admit a ray of light. In front of the glass is a telephone diaphragm, which, by its vibrations, opens and closes a small shutter through which a beam of light is constantly passing and imprinting a dark line on the glass. Vibrations of the shutter cause the dark line to vary in thickness according to the tones of the voice. The glass plate is revolved by clockwork, and the conversation as it leaves the telephone is recorded on the sensitive plate, the imprinted words spoken being fixed as is done in photography. The plate can be brought forward afterwards, and when replaced in the machine and connected with a distant telephone, will, when set in motion, give back the original conversation.

COLORADO'S GRAND CANYON.—Prof. Archibald Geikie remarks, concerning the future history of the grand canyon of Colorado, that it has still about 1,000 feet to remove from the bottom of its channel before its slope will become so slight that its erosive power will nearly cease, and that it is conceivable that, should no geological revolution occur in that region, the canyon may still be deepened to that amount. There are indications, however, that a limit may be set to the possible depth of the chasm. As in the so-called "creep" of a coal mine, the bottom of the canyon, relieved from the weight of the over-lying column of rock, may be forced upward by the pressure of the walls on either side. In that case the channel might rise as fast as the river cut it down, so long as nothing occurred at the surface to materially diminish the bight of the wall.

HARDENING SOFT LIMESTONES WITH FLUOSILICATES.—The application of alkaline silicates to the exterior of buildings, in order to prevent the deterioration of the stone, has not been attended with satisfactory results. H. L. Kessler proposes to use a solution of fluosilicates of bases whose oxides and carbonates are insoluble in a free state. When soft limestone is saturated with a concentrated solution of a fluosilicate of magnesium, aluminum, zinc, or lead, a very considerable degree of induration is soon reached, and the resulting products, except the liberated carbonic anhydride, are less soluble than the stone itself. No varnish is formed, and therefore no danger arises from expansion of frost beneath it. The process has resisted the severe tests of winter. Colors may be introduced satisfactorily.—*Les Mondes.*

GAS AND ELECTRICITY FOR LIGHT.—Foreign journals report an arrangement for producing brilliant light by the combination of gas and electricity. It consists of an ordinary gas flame, through which passes a curved metallic rod provided with means for counteracting the effects of overheating under the action of the current. A cool, bright light is produced, of far better quality than gas alone. The report states that the platinum does not require a great intensity of current to make it supply an ordinary light with one or two small elements. The cost is said to be a third less than that of the gas supplied by the gas companies.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—*Ledger*, Dec. 1: The recent strike of ore in the South Spring Hill holds its own. The ore body has been followed 60 ft in length 10 ft in hight and 5 ft in thickness. It may be much more extensive every way. More than this, it maintains its high grade throughout. The mill is being put in readiness for crushing as rapidly as possible. From 15 to 20 men are employed about the mine. An ore dump has been constructed, and a wagon road is being made from the dump to the road.

CONFIDENCE.—This claim is near Butte City, about 2½ miles southeast of Jackson, and is owned by Hageman, Matson and Fleming. The 5-stamp mill was started again Monday, with every prospect of a long run. The tunnel is in 180 ft, the ledge has widened out to 4 ft, and looks better than the first lot run through, which yielded over $10 per ton in free gold. There are 9 men employed about the mine and mill. The 5 stamps crush 12 tons per day, and 500 or 600 pounds of sulphurets are saved every 24 hours. These sulphurets are worth from $120 to $130 per ton, sufficient of themselves to pay the running expenses of the mine.

AMADOR CON.—No superintendent has been appointed to take the place of D. T. Davies, resigned. The mine is in charge of Elias Pitchard, and the mill under Hiram Deacon. F. B. Latham, secretary of the company is still in Sutter Creek, taking the general oversight of affairs.

NOTES.—Mr. Pilsbury, who is staying at W. A. Nevill's near Middle Bar, received a dispatch dated Nov. 27, from El Dorado, El Dorado County, that a rich strike had been made in the Starlight mine. Between $10,000 and $20,000 was taken out in a short time. The mine is an old one, from which hundreds of thousands of dollars have been taken out in early days by the Mexicans, and all above the water level. James Stewart is taking out ore from his claim near Butte City. J. C. Mello is sinking on his quartz claim near Big Bar bridge. The Zeile mill is now running the full 40 stamps by water power. I. N. Dewitt and others are ground sluicing at Murphy's ridge. The new ditch to the Mammoth mine was finished Thursday. At the big tunnel at Middle Bar, a change in the contract was made this week. The tunnel is in 300 ft; the face in soft slate. Eighteen men are pushing the work ahead as fast as possible, making about 8 ft every 24 hours.

AMADOR CON.—The *Sentinel*, of 28th, says: D. T. Davis, who has been superintendent of the Amador Con. mine for the past 7 or 8 years, has gone to Washington territory to superintend a coal mine. There will be no ehange at the mine at present, Mr. Pritchard, who has been the underground boss, will take charge. At the 300 level they are drifting north and south and have struck some very good rock south.

El Dorado.

NASHVILLE.—Placerville *Democrat*, Dec. 1: The Nashville mine, owned by Joshua Hendy, of San Francisco, is proving to be a veritable bonanza. The shaft is now 520 ft deep. Sinking has been stopped for the present, and a drift is being run south from the 500 level; it is now in 37 ft. The ledge at this point is 7 ft wide, the ore of a high grade, and indications point to an immense body of it further south. The mill was started up several days ago, but from a lack of power they have only been able to run 10 of the 20 stamps. Mr. Knight, of the Sutter Creek foundry, came over to-day to arrange for some alterations in the water-wheel, and in a few days we may expect to hear the clatter of the other 10 stamps. On account of the above-mentioned trouble with the water-wheel, and not from a lack of ore, the mill has not been run very steadily, but the amalgam is filling up on the plates in a manner calculated to make glad the heart of Joshua Hendy.

LONE STAR.—Mr. Heald's mine, the Lone Star, is situated 1½ miles south of Nashville, on the mother lode. It has been prospected to a depth of 90 ft, showing a well defined ledge of good milling ore of an average width of 6 ft, and prospecting in places as high as four bits to the pan.

CUMBERLAND.—The Cumberland, Mr. Hart's mine, is just across the river from Nashville, immediately north of and adjoining the Nashville mine. It was worked in early days under the name of the Montezuma mine, turning out some very rich ore which was crushed in one of the first, if not the first, mills built in El Dorado County. During the past summer Mr. Hart discovered a new pay chute upon which he has sunk a shaft about 50 ft. It shows as pretty a ledge as is to be found in the county, and the ore is of a high grade.

STARLIGHT.—In a former letter I gave you a description of the Starlight mine, about 1½ miles south of this place. J. C. Boyd has been appointed superintendent, and under his management very rich rock has been taken out, and about one week ago I was shown one specimen weighing about $8 of pure gold. But to cap the whole thing, he took out on last Friday about 80 pounds of rock that seemed to be half gold, and the same was variously estimated by those who saw it to be from $2,000 to $10,000.

EUREKA.—Georgetown *Gazette*, Nov. 30: The new stamp mill on the Eureka mine will be ready to start up on or about the first of January. The work is being well done, and will be first-class in every particular.

VOLCANOVILLE.—R. G. Hart of the Flora drift gravel mine near Volcanoville, who has a large force employed, was in town this week purchasing supplies. A four-horse load went up Thursday.

Fresno.

RICH STRIKE.—*Expositor*, Nov. 28: John Krohn informs us that Floyd, Dods, Strombeck and others have just made a very rich strike in their mine on French Gulch. They struck ore that they feel certain will pay over $100 per ton. They have leased an arastra and will commence crushing at once.

Mariposa.

VIRGINIA MINE.—*Gazette*, Dec. 1: The work on this mine is progressing rapidly. They are running two tunnels, the old Coe tunnel and a new one above. They have a fine vein of gold-bearing quartz in the new tunnel, in which considerable free gold can be seen with the naked eye. Mr. Mast intends starting up the mill as soon as the mine is opened sufficiently to keep the mill constantly running.

Mono

BYRANT.—Bodie *Free Press*, Dec. 2: James McDonald had a sample of Bryant sulphurets assayed by Soderling, a few days ago, and the result was $2,992.40 a ton. As the ore contains a good percentage of them, it would be quite an object to save them. Nearly all the ores of Homer District are rich in the same manner, independent of the free gold they contain.

STANDARD CON.—Bodie *Free Press*, Nov. 28: Extracted and shipped to the mills, 1385 tons of ore. Received 1900 ounces of crude bullion, and shipped to the company $12,858.23. Upraise No. 1 from north drift No. 2, 1000 level, has been raised during the week 7 ft; total length, 40 ft, vein 4½ ft wide and looks well. North upraise No. 1, from north drift No. 4, is up 170 ft, and is all in ore. North upraise No, 2, from same drift, is up 80 ft all in ore.

BODIE CON.—During the week ending 24th inst there were 222 carloads of ore hoisted from the mine. The average assay value of the pulp was $15.39 per ton; that of the tailings was $3.77.

BULWER CON.—The north drift, 700 level, has been advanced during the week 20 ft; total length 450 ft, with no change to note.

BODIE TUNNEL.—The north drift 200 level, has progressed 11 ft, and south drift, 300 level has been advanced 10 ft during the past week.

THE SUIT DECIDED.—Bodie *Free Press*, Nov. 29: About 11 o'clock Saturday night the jury in the Holmes case sent word that they were ready to report, and as soon as the lawyers could be got together they rendered their verdict for $360,000 against the Northern Belle. The Holmes folks will have to take the Northern Belle mine as it is, for they do not expect stockholders to pay an assessment large enough to pay the judgment. W. W. Hobart, who was in the interest of the Northern Belle, says the Northern Belle folks will never pay the judgement. He says they made the fight as a matter of pride, for, in fact, the Northern Belle is worked out and is almost worthless.

MAY LUNDY.—Bodie *Free Press*, Nov. 27: Saturday last 75 men were discharged from the May Lundy mine, for what reason is not learned. It was hoped that the new company which, it is said, is to take hold of the May Lundy, would employ a large number of men this season and give the camp a start and it may be so yet.

Nevada.

NOTES.—*Transcript*, Nov. 29: At the South Yuba River mines the flume and undercurrent are being constructed and the river can be turned through the tunnel by December 10. At the Charronat the work to substitute water power for steam in running the mill and hoisting works is being pushed, and they are about to begin laying the iron pipe to bring water from the South Yuba Co.'s new ditch. It will take 2 weeks. Thomas, Hampton & Co. have had a crushing of ore from their mine in Willow Valley made at the Deadwood mill. The yield was between $20 to $25 a ton. The Nevada City Co. are about ready to open a new level at the depth of 750 feet. Drifts will be run north and south on the ledge. Fine ore is being extracted from the 450 and 600 levels. The Derbec Co.'s new drain tunnel has tapped the old workings. It was raised 10 ft towards the last to prevent a rush of water, but the connection was made unexpectedly and for a short time the men were demoralized, anticipating that they would be flooded out. Fortunately the stream was not a strong one and no damage was done. Hussey & Hussey started up this week the new hoisting and pumping works on their claim in Willow Valley. The machinery works admirably The hoisting works and mill on the Birdseye cement claim near You Bet are nearly completed. Every thing will be in readiness to start the machinery by Saturday.

NEVADA CITY MINE.—Pres. Shoecraft says it was the intention of the Nevada City Co. to double their milling capacity this fall, but the Board of Directors concluded to wait till spring. The Nevada City is one of the big mines of the state. Twice as much ore is being extracted right along as can be crushed in the 20-stamp mill, and good judges figure that there is at least half a million dollars' worth developed. Occasionally some remarkably rich deposits are found. A sample of the latest bonanza is at the Citizen's Bank. It is as big as a man's head and contains over $600 worth of gold.

EMPIRE MINE.—The *Union* says: The mill has been thoroughly overhauled, new mortars put in, self-feeders introduced, and other new improvements made. The cost of the improvements will be about $17,000. In the meanwhile the underground work of the mine has been going on as usual, and there is a large quantity of good ore accumulating.

WYOMING.—At the Wyoming mine a new spur wheel, pinion wheel and pump bob are being put in, and a stone foundation laid for the pumping engine. These changes will take 3 weeks, but work in the mine will not be interfered with as the water will be baled out with the hoisting engine.

MAGENTA.—*Union*, Nov. 28: The shaft of the Magenta mine has been pumped out and sinking will be commenced the last of this week. The shaft is 365 ft deep, and a new level will be opened at the depth of 400 ft. An 18-inch ledge now shows in the bottom of the shaft which prospects well in free gold.

CANADA HILL.—Weisenburger & O'Hearn have entered into a contract with the Charonnat Co. to take out 100 tons. They have struck fine looking rock. Samuel Barr is working a ledge that prospects well. Lately a streak of very rich ore was met with, which increases in size and quality as work progresses. Other ledges in the neighborhood of Canada Hill are looking well

Placer.

ALTA MINE.—Dutch Flat *Times*, Nov. 24: Work in the new shaft in the Alta mine was shut down Saturday. The suspension is only temporary. The supply of water in the shaft had become so great it was more than could be kept out with the buckets and horse-power hoisting apparatus, and work was suspended until a boiler and engine could be secured and a steam pump placed in the shaft. When work was suspended the shaft was down to a depth of 140 ft. Many fine specimens have been taken from the gravel, and the company is very sanguine of striking good pay at the bottom, which is expected to be reached at 210 ft.

PINO.—*Herald*, Dec. 1: The Laird mine is now running in full blast, and the new mill is doing excellent work. The amount of dust cleaned up seems to be entirely satisfactory to the company.

Plumas.

GARFIELD.—Greenville *Bulletin*, Nov. 28: The new ore house at the Garfield mine was finished some days ago, and is now being filled with ore. The vein at present is 4½ ft wide, and looks well.

San Bernardino.

BELLE MCGILROY GROUP.—*Calico Print*, Nov. 30: In the Belle McGilroy mine a tunnel about 200 ft in length has been run in, cutting three bodies of ore of a paying quality. In the tunnel are three shafts, the first, 65 ft from the surface, and the other two about 40 ft each. Besides these there are several small openings. There are 400 tons of ore on the dump, the value of which can be determined by the fact that about 30 tons of the same character of ore were crushed by the Bonanza King Co.'s mill which realized in bullion $125 to the ton. The owners of this group are P. R. Dyer and Richard Gorman.

MOZART.—The Mozart group adjoins the Belle McGilroy on the south, and consists of the Mozart, Blue Blazes and another. Two shafts have been sunk in the Mozart mine, each about 95 ft deep, in the bottom of which is seen a good showing of ore similar in appearance to that of the Bonanza King, and which assayed $325 to the ton. Another shaft 35 ft in depth has also been sunk. A tunnal about 50 ft in length has been driven in, besides several cuts and openings. There are 30 or 40 tons of ore on the dump.

SHENANDOAH.—The Shenandoah mill and mine on La Mesa is still hammering away; the shaft is now down about 175 ft with an 8 ft ledge of 40-dollar ore in the bottom. They get more than ore enough from the shaft to keep the five-stamp mill running, the clean up from which last month for a fourteen-day run was over $3,000.

Shasta.

SUNNY HILL.—Cor. *Courier*, Nov. 30: The Sunny Hill mines are progressing steadily. It is now conceded that the Gitupandgit, the Spencer and Charles Kaberner claims are all one and the same ledge. They are in a direct line, running northwest and southeast—having for their hanging wall a porphyry ledge varying from 4 to 12 ft wide. This is perhaps the greatest find ever made on the coast. The ledge so far as prospected extends over a mile and a half in length.

SPRING CREEK.—Stowell was down from his upper Spring Creek mine Wednesday. During the past summer he has put up a house, and this winter he will work in the tunnel, which he is running to tap his ledge. From the surface prospects, it is evident that he has a claim something similar to the Iron Mountain bonanza.

Quite a lot of ore has been brought down from Iron Mountain this week, and we understand that a wagon load per day will be brought down next week. The last sent below gave very satisfactory results.

NOTES.—*Democrat*, Nov. 28: Levi Day passed through town to-day on his way to the East Fork mines to haul quartz to the arastra. The company will start crushing next week. They feel confident of good returns. From Pat Lawton who has lately come in from Eastman's Gulch, we learn that J. C. Hickey has again struck his ledge by a 400 ft tunnel. The ledge is struck at a depth of 200 ft and is from 15 to 20 inches in width, and prospects at the rate of $60 to $70 to the ton. Dan O'Neal returned from the city the first of the week, having purchased his quartz mill. It will be shipped up in a few days, and Dan will probably be crushing before the first of the new year.

Sierra.

BALD MOUNTAIN.—*Messenger*, Nov. 24: Sunday the Bald Mountain Extension Co. cleaned up 23 ounces from 75 carloads. There was but little water. Wood is being hauled to the Pliocene shaft, and in a few days pumping will be resumed, and enable the company to wash the rich gravel accumulated in their large dump.

HOG CANYON.—Thursday, A. W. Bishop, of Oakland, called on us. All their winter supplies are laid in, and sinking has been commenced on two ledges. They are down 30 ft on one, and 15 on the other. One of these is a 4 ft ledge. Ore pounded in a hand mortar averages $12 to $16 a ton. Sufficient rock will be taken out this winter to warrant the building of a mill next spring. Six men are employed.

EGGLESTONE AND MOWRY.—The undivided one-half interest, including mine, ditch, tunnel and the appurtenances thereto attached, was appraised at a little over $6,000, and individual property $2,000. The Egglestone and Mowry mine contains one hundred and nineteen and one-half acres, and all or nearly so pay ground. The mine yielded handsomely this season's run.

JUNCTION MINE.—The Junction mine was first located about 20 years ago, and several thousand dollars sunk in running tunnels to develop the mine. Mr. J. B. York inspected the old works and came to the conclusion that it was a good mine, and formed a company and relocated it. His partners proving to be too slow-going to suit him, he bought them out. Though laboring under many disadvantages, he pushed right ahead. For reducing the ores a 12 ft arastra is used. Though a slow process, the results obtained for the last season's run were very satisfactory. Mr. York has no thanks to offer the wet blanket element. The lode is well defined, walls nearly vertical, vein averaging 3 ft thick. As far as the vein has been explored, it has all the characteristics of permanency. Not a pound of rock taken out of the mine last season, but what, including that on the old dumps and scattered about on the hillside, was gathered up and put through the arastra yielding $15 per ton. There are but a few mines in the county that can show better results.

Tulare.

KAWEAH RIVER.—*Delta*, Nov. 22: Edwards & Stevens recently sent a sample of the rock from their mine to the State assay office, and received a certificate of assay showing one hundred dollars and forty-six cents in gold per ton, and seventy-eight cents in silver. Mr. Barton, who has lately constructed a water arastra, on the Kaweah river, for the purpose of milling this rock started his machinery last week, and on Saturday had crushed three tons. The mine is seven miles from the mill, with which it is connected by a level road. The wheel of the mill has power to run four arastras, and the water power is sufficient at the lowest stage of the river, to run thirty. One fact connected with this river seems to explain why no placer diggings have been found in this part of the State. It is seldom that a single particle of gold is found in the rock large enough to be seen, but when an ounce of rock is crushed and washed in a horn spoon a cloud of flour gold is revealed.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Enterprise*, Dec. 1: On the 2700 level the north drift was advanced to a point about 80 ft north of the station, and on the 22d work was temporarily discontinued in order to resume sinking the incline winze below the 2700 level. The winze is making good progress in favorable ground. At the point where work was discontinued they had a streak of very fine ore 15 inches in width. Assays of this were from $20 to $600.

UNION CON.—The double cages are working well. The main north drift from the 3100 station is out 40 ft. It will be pushed on a direct course for the main north drift with which it is desirable to make connection as soon as possible.

COMBINATION SHAFT.—The new hydraulic pump is now being shipped to this city. All is in readiness to receive the pump, which can be set up in about 10 days.

IMPERIAL.—The west drift from the 600 station is being pushed as rapidly as possible for the works in the old upper level. It is out about 200 ft. Once this drift has reached its point, explorations will be commenced in the old ground of the Alpha, Exchequer, and Imperial.

SIERRA NEVADA.—The upraise from the 2900 level is being advanced at the rate of 15 ft per week in favorable ground. On the 3100 level a north drift will be started in a few days from the joint Union Con. station.

ALTA.—Good progress is made in draining the mine. The water is out nearly down to the 2150 level.

UTAH.—Good progress is making in repairing the incline upraise on the 1350 level connecting with the 1200 level at the south line of the ground.

BEST AND BELCHER.—The joint Gould and Curry winze is being sunk and timbered at the rate of 15 ft per week. The bottom is in ground of a favorable character.

GOULD AND CURRY.—The joint Best and Belcher winze that is being sunk below the 2500 level is down nearly 90 ft. The bottom is in ground of a favorable character.

MEXICAN.—The main north drift on the 3100 level has now passed across the north line and is being advanced in the ground of the Union Con. Co. The drift and upraise on the 1600 level are being repaired.

CROWN POINT.—About the usual quantity of ore is being extracted and shipped to the mills on the river.

OPHIR.—Are extracting the usual amount of ore from the 150 level. This ore is being reduced at mills on the Carson. On the 1600 level the drift and upraise are being repaired.

YELLOW JACKET.—About 100 tons of ore per day are being extracted and sent to the mills.

ANDES.—The face of the north drift still continues in quartz of a promising appearance. The south drift from the winze is in quartz that gives promise of ore.

BELCHER.—A considerable amount of ore is being extracted from the old upper levels, and a good deal of exploring work is being done.

CALIFORNIA.—The joint Con. Virginia winze on the 2700 level is being sunk and timbered at the rate of 12 ft per week.

CON. VIRGINIA.—The joint California winze on the 2700 level is being sunk and timbered at the rate of 12 ft per week.

OVERMAN.—Some low grade ore is still being extracted from the old upper levels.

THE UPPER LEVEL.—It is stated that Senator Jones has leased from the Con. Virginia and California all that portion of their mines above the 1550 level. He is to account for 70 per cent of the assay value of the ores and deliver all bullion extracted from that percentage. From these proceeds the Sutro Tunnel royalty and working expenses are to be paid, and the Senator is to get $9 per ton for transportation and milling, the company is to get the balance.

Belmont District.

BELMONT MINE.—*Courier*, Nov. 24: Every thing is working satisfactorily. Supt. Fassett is pushing the work in the south tunnel vigorously, and a good ore is encountered. Operations in the north end are also progressing favorably. Work is also prosecuted in the Moore & Martin ground with flattering results. The Belmont Mining Co. have shipped 3 bars of bullion valued at $4,754.35. The company will make regular bullion shipments from this on. The following is a copy of Supt's letter of Nov. 24: "The winze from No. 1 level in Laity ground is now down 50 ft, in which the ledge is coming in solid as before. South Tunnel stopes are yielding fine ore in usual quantities. We are now opening stopes in fine bodies of ore on 200 level from main shaft, which will be producing ore in 2 or 3 days. Hoisting works in complete repair; running nicely. Chlorinations at mill from 90 to 92 per cent.

Candelaria District.

MOUNT DIABLO.—*True Fissure*, Nov. 24: The stope from lower winze No. 2 shows a little $60 ore that looks encouraging. The stope near winze No. 1, below the third level is yielding considerable low-grade ore, while that above the west drift on the same level is looking well and giving considerable $65 ore. The stope near winze No. 2, below the third level shows some 9 inches of $55 ore. A bunch of $100 ore has been struck in the east drift on the third level, which looks very promising. The intermediate between the first and second levels, is turning out $75 ore. The stope above the west drift from the Callison winze is yielding the usual amount of $60 ore. A bullion shipment amounting to $9,234.87 was made last Monday.

Esmeralda District.

SPANISH CAMP.—*Herald*, Dec. 1: Quite a town

is springing up at the Spanish Camp, about half a mile above the Mount Cory mill. Already there are four saloons in full blast. Almost every day lumber is shipped from here for building, and if the boom continues the Camp will assume gigantic proportions before snow flies. There are five families and about 100 men at the Camp. The new strike is only half a mile distant, and we understand is developing nicely, pieces of quartz being taken out of the ledge in which gold can be plainly seen with the naked eye.

GOOD PROSPECT.—*Herald*, Nov. 24: From reliable authority we learn that the samples of ore taken from Big Indian Con. mine, by the party of capitalists who recently visited and examined that property, yielded an average of $50 per ton.

Eureka District.

MINERAL HILL.—Cor. *Sentinel*, Nov. 29: The Christie mill is running very smoothly, working some 35 tons of tailings daily. About 12 tons have been shipped to the Geddes and Bertrand mill to be subjected to the leaching process, and if the result proves satisfactory, similar works but not on so large a scale will be erected here.

A NEW CAMP.—Campbell district, which is on the line between Eureka and Lander Counties, is beginning to show signs of life. The principal village is called Frisbie. During the past two weeks six private dwelling houses have been built. New prospects are being discovered every day, and things in the neighborhood look promising. The Silver Side mine is working 20 men and shipping ore to Salt Lake. The owners, however, expect to have a mill of their own erected in the camp.

The Elko *Free Press* of Nov. 23 says of the Bullion company at Frisbie named above: "They own one of the finest mining properties in Eastern Nevada, and the mine is opened to a depth of 230 ft from the surface, and shows a continuous ledge that averages 2 ft in width and assays $180 a ton. There are over 500 tons on the dump at the mine ready to be hauled to the mill. The mill has 10 stamps and all the modern improvements."

Paradise District.

BULLION MILL BURNED.—*Silver State*, Nov. 28: Yesterday Charles Kemler received a note from Paradise informing him that the Bullion of Paradise mill was burned at 2 o'clock yesterday morning. It is supposed that it caught fire from sparks from the retort, as bullion was being retorted at the time. It was a 10-stamp mill owned by the Bullion of Paradise Co., and was working ores from the Bullion mine. Until recently it had been insured for $20,000, but at present the insurance was only for half that amount.

WILLOW CREEK.—There is a genuine excitement over the discovery of what are believed to be rich placer mines at Skull Creek, a tributary of Flat Creek, some 6 or 8 miles from Willow Creek station, on the Idaho road. It appears that coarse gold has been found along the creek for 2 or 3 miles, and claims have been located nearly the whole length of the stream. Though gold had been found in the streams in the vicinity years ago, and considerable surface mining has been carried on, there never had been a prospect hole sunk on Skull Creek until very recently. F. P. Snapp, at Rebel Creek station, informs us that the most exciting reports had reached his place relative to the diggings.

OHIO.—F. P. Snapp ships to-day to Salt Lake 17 tons of ore from the Ohio mine in Rebel Creek District. The ore averages $350 to the ton in gold and silver.

Pioche District.

MENDHA.—*Record*, Nov. 24: The Mendha mine has improved greatly the last week. There is more ore in sight at present than for months. This ore is of high grade, and is galena; just what the furnace requires to work the ore from the Day mine.

BULLIONVILLE AND PANACA.—J. R. Duff and J. F. Ryan passed through Bullionville on their return from Chief district. They intend putting on a number of men this coming week, and if the mines continue to improve, will erect a mill. Condor Canyon is the only lively place in this vicinity. Mase Dixon and his partners are making money out of the tailings. The tailings assay from $30 to $50. It is very cold in the canyon, and the flume freezes at night. About 12 tons of concentrations have been shipped from Condor Canyon. In all probability the Smelting company may resume operations next June.

Pyramid District

PYRAMID MINE.—Reno *Journal*, Nov. 24: The reports from the Pyramid mine at Pyramid Lake are exceedingly encouraging. Without doubt a great and very rich body of ore is being developed. The *Appeal* says an assay made by the assayers of the U. S. Mint at Carson from ore taken from the cross cut 550 feet below the surface shows $130.85 silver and 58.46 per cent or $200 per ton copper, making the total value per ton $330.85.

ARIZONA.

GRAND CANAL QUARTZ MILL.—Phœnix *Herald*, Nov. 22: J. Ramsdell and A. W. Wiley have been putting the Grand Canal quartz mill into shape to run this winter, and have so far completed their preparations that the mill will start five stamps on next Monday. About 60 tons of ore are on hand, and more are being put on the ground rapidly from a group of mines 15 or 20 miles north of town in the Winnifred district.

ITHICA.—Captain Cherry, of the Ithica Consolidated mines on Cave Creek, came in last evening and reports fine progress. We are in possession of a sample of ore from one of this group that is exceedingly rich in black oxide of silver, and Captain Cherry informs us that there is a large body of this rock.

NOTES.—Prescott *Courier*, Nov. 24: Geo. W. Curtis tells us that the gold mine over on Lynx Creek is yielding rock which is worth $1,000 a ton. A shaft has been sunk a depth of 15 ft below the 100 ft level, and the ledge therein is larger than before. Good ore is being taken out of the Holmsite mine on Turkey Creek. Jack McDonald, of Dosoris Camp, tells us that the Blue Dick and Dosoris continue to yield an abundance of high-grade ores. Harry Ashton, who is working a silver mine near Silver Mountain, was in town yesterday having some assays made. The average of his best ore was $6,220.62. Former workers in the Chicago mine, Groom Creek district, passed by 18 inches of very rich ore, and pronounced the mine a bilk. It is this way that many rich mines have been given black eyes. Copper properties belonging to the United Verde company which a couple of years ago could not be sold for $2,000 are now worth as many millions. E. M. Clark, of the Arizona Queen company's mines, on Groom Creek, yesterday bought a ten-stamp battery.

TOMBSTONE.—*Epitaph*, Nov. 25: At the Contention mine, the erection of the pumping machinery is well nigh completed. Both large main cylinders are in place, and steam was let on for the first time yesterday. Underground every thing is progressing nicely.

RUBY.—Work has been resumed on this property, and the main shaft is now down 126 ft. No ore-body of large extent has as yet been struck.

SILVER KING.—Final *Drill*, Nov. 24: The Silver King company has now at Casa Grande the machinery for well boring, and are going to sink a 12-inch well down in the mill to increase the supply of water. Besides the Queen Creek flow, they have now a 6-inch well 150 ft deep. They will go through the volcanic rock, and probably have abundant artesian water.

Every where the mines in our district look better as work goes on. We want depth and are gradually and annually getting it.

IDAHO.

BULLION AND OPHIR.—Wood River *Times*, Nov. 21: A miner who came down from Bullion to-day stated that between 100 and 125 men were still employed in the mines of the Wood River Co. The recent discharge of some 75 men out of the Bullion mine simply means that a great deal of dead work which had to be done is completed; but the yield of the mines is from 20 to 30 tons per day, and, therefore, just as large as ever.

SAWTOOTH.—One bar of the bullion from the Vienna mill, and worth about $1,400, was shipped from this city last evening; also, 3 bars of Columbia and Beaver mill bullion. These, with the 2 bars shipped 2 or 3 days ago, make a yield, in less than a week, of 5 bars weighing 426 pounds, and worth about $7,000. The Columbia and Beaver mill is still running, and it will continue to run until "everything" freezes up. As the Vienna mill is also running, more bullion shipments may be looked for this fall.

PHILADELPHIA SMELTING WORKS.—Mathews, Pres. and Rhodes, Vice Pres. of the Philadelphia M. & S. Co., came in last Friday, to make inspection of their smelting works before shutting down for the winter. They were surprised at the mildness of the weather, which has permitted the running of 2 stacks, which turn out an average of 17 tons of bullion per day. They expected to see the works on the point of shutting down, while, on the contrary, they saw every preparation made for a prolonged, if not continuous run.

STANLEY BASIN.—*World*, Nov. 23: A new order of things is arranged for the old-time placer camp of Stanley Basin. During the past summer a gang of Bellevue boys located several placer claims. The older-timers there, who have worked in the basin for 5 or 6 years, proposed to sell out to the newcomers. The result is that a Nebraska Co. was organized and the old-timers were brought out. The new company has surveyed a ditch and partially completed it. Heretofore only snow water, early in the summer months could be utilized. The ditch is to be 15 miles long, and will supply 5,000 inches of water the year round. The company now owns all but 20 acres in the basin—nearly 300 acres in all. Every body knows of Stanley Basin; how those men with 100 ft flumes and a few boxes have cleaned up, in the 20 or 60 days' run they have had in the years past, from $1,000 to $6,000, and how they, with a rocker, have made from $5 to $100 per day, many a time and oft.

BANNER.—Joe Robbins and 12 others will work in the Banner mine this winter. A shaft will be sunk to the depth of 100 ft from the face of the lower tunnel in the Banner mine, which tapped the ledge at the depth of about 300 ft. Bradford, McLain, Austin and Gallager, who have a contract from the Elmira Co., for running east and west on the Wolverine ledge, at Banner, will work all winter.

MIDNIGHT.—Ketchum *Keystone*, Nov. 24: John Campbell, of Hailey, has been representing the Midnight claim, on Warm Spring Creek, through J. G. Lindsey. The latter came to Ketchum Thursday, and reports the claim in a beautiful condition. The ore bodies in the old works are good, showing a 2 ft vein, containing considerable quantities of galena, assaying from 400 to 600 ounces.

VIENNA AND LION.—Col. Brodhead and J. B. Hastings, returned this week from Vienna, where they had been to fix the location of the new tunnel of the Vienna mine in connection with the compromise line between the Vienna and Lion. They report wonderful bodies of rich ore exposed by the stopes and drift of the mine, and add that the developments being made in the Vienna enhance the value of the Lion.

ATLANTA.—Ketchum *Keystone*, Nov. 21: The Buffalo mill has closed down for the winter. The Buffalo mine will work but a few men, by contract, during the winter. The construction of the new Tahoma mill has been suspended. It is reported that the cause is discord in the company. The Last Chance mill and mines have closed operations entirely for the winter. The Monarch employs a winter crew of 14 men. The Leonora mill started up Monday on ores from the Leonora mine, which has been in operation for some time.

COEUR D'ALENE.—The Idaho *World* of Nov. 23 copies the following from the Palouse City *Boomerang*: "Mr. Jesse Bishop, an old miner, has just returned from the new diggings. He has been there for several months, and has had an ample opportunity to investigate the many reports, and from actual knowledge can give reliable information concerning the camp. He says that there is no doubt but the rich ground extends over a large extent of country, the richest not yet discovered. All the creeks and side gulches give good prospects. Quartz ledges have been struck that are lousy with gold."

But little prospecting for quartz has been done owing to snow, which is eighteen inches deep on the hills. The claim owners have held a meeting, and passed a law allowing claimants to be absent until the first of next June. The camp is filling up with roughs from the railroad, who express a determination to make claim jumping a specialty. They say that the 20-acre racket "must go." Mr. Bishop says it is his opinion that every claim in the camp will be jumped before spring. It is probable that injunction suits, forcible entry and detainer squabbles and post mortem examinations will occupy the time of the miners next summer.

THE NEW MINES.—The following is from the Virginia *Enterprise*: Bozeman, Nov. 28: There is great excitement throughout Western Montana over the rich mineral discoveries in the Coeur d'Alene Mountains. Miners and prospectors who have returned state that there has been nothing in the history of the Western States and Territories equal to the richness and volume of the newly-discovered fields. The minerals consist of silver, tellurium and free-milling gold. Over $100 per man per day is being taken out of the rim rock of the gulches, while in the gulches $25 to $40 per man per day is being panned out. The streams are in the southern part of Idaho. Eagle City is 40 miles from Heron on the Northern Pacific railway. There are now about 500 people in the camp.

ANOTHER LETTER.—The Eureka *Sentinel*, gives part of a letter from J. B. Parker, a resident of Eureka, now in Eagle City: "Several parties that have tried to approach this camp from different directions have traveled for days, making no more than 2 or 3 miles a day, and in some cases no more than a mile a day. In several instances men have abandoned their horses and equipage piece by piece, and have arrived here with only a blanket and the clothes on their back, and nearly starved. One party of men was out between here and a point on the Northern Pacific called Heron, a distance of 25 miles, for 21 days, and if it had not been that they 'discovered some fresh water claims on the north fork of the Coeur d'Alene River they probably would have perished. This is Eagle City—5 saloons, 4 stores, a butcher's booth and 2 places where some dirty individuals dish up bacon, coffee and fried dough, cooked at a camp fire, for $1 a head. This is the starter for a new camp, which I believe, from what I have seen with my own eyes, will make as great a mining camp as has ever been since the days of '49. On Eagle Creek they pan out from a color to 75 cents and $1 for 12 to 14 miles, and on Pritchard Creek the same result for 15 miles. There are a few claims that are being practically worked; these pay big, none less than $6 a day and some as high as $20 a day to the man. It is coarse gold from smaller than a pin head to the size of a pea—and numerous nuggets. I have seen 1 nugget weighing $100, and several from $15 to $50. It is "awful" pretty. Not more than 300 or 400 men will stay in here this winter, as there can be no mining done. The snow will be 5 or 6 ft deep. It will be very expensive every way living here during the winter. Companies of miners leave men enough to hold their ground and the rest skip out for civilization. I am going to make a "settle-down" stake here. I am certain that it is going to be a wonderful camp.

MONTANA.

ALICE.—*Inter-Mountain*, Nov. 24: The 80 stamps in the 2 mills of the Alice Co. continue to make musie. The ore comes mainly from the Magna Charta, but recent explorations in the Alice have resulted in largely increasing the output, and it now produces about one-third of the ore the company is treating. The furnaces are doing good work, the chlorinations hugging 90 per cent with gratifying regularity.

LEXINGTON.—The Lexington is maintaining its magnificent record. It has produced nearly $1,200,000 since the first of January last, figuring the silver in the bullion at the value of 1.05. The new mill is running on ore from the Lexington mainly, but treats daily about 10 tons of ore from the Allie Brown, also owned by the Lexington. The old mill is working principally on tailings, of which there are 15,000 tons available for reduction.

MOUNTAIN VIEW.—There can no longer be a doubt that the Mountain View and Anaconda ledges are identical. The best mining men in the district, after a personal inspection of the ground, have expressed this conviction, and renewed interest is felt in the present explorations. The face of the 300 ft south cross-cut is now 230 ft from the shaft and has penetrated the mammoth ledge for a distance of 80 ft without yet encountering the hanging wall. The character of the ledge matter closely resembles that of the Anaconda at the corresponding depth. The ore occurs in patches and streaks which increase in frequency as the hanging wall is approached.

PARROT.—The Parrot shaft has attained a depth of 300 ft. A large station is completed. The north vein has been cross-cut a distance of 40 ft from the shaft. The vein is 10 to 15 ft thick, carrying a heavy percentage of copper, and frequently coated with leaf silver.

PHILIPSBURG.—Cor. Butte *Miner*, Nov. 24: The crushing of 1,500 tons of ore, taken as it came from the stopes, yielded the Granite Co. 8 tons of silver, .999 fine. As thousands and thousands of tons yet remain, it would be an excellent idea for those who do not favor the demonetization of silver coin, to buy in this property. The president of the company wires me that it can be purchased for $200,000,000. The Granite Mountain alone has shipped bullion valued at $200,000 during the past 2 months, the last shipment 10 days ago amounting to $125,000. The principal work on the mine has been done during the past 2 years. A large amount of ore is being worked at the Algonquin mill which is owned by the Granite Mountain Co., and the battery samples are running from 220 to 225 ounces per ton. The mill crushes 20 tons per day turning out $4,000 in refined bullion every 24 hours. The company early next year will erect a silver mill of 60-stamps, and work their property on an extensive scale.

FISH CREEK PLACERS.—During the past fall a number of men have been at work on Fish Creek, where Highland comes out. Yesterday it was learned that the labors of these men had been rewarded by finding placer diggings which pay handsomely. The location is at the southeast entrance to Fish Creek Canyon, 16 miles from Butte. Old miners who have been in report they obtained favorable prospects 20 years ago.

NEW MEXICO.

STEEPLE ROCK.—Southwest *Sentinel*, Nov. 24: The Norman mine, in Steeple Rock district, is said to be in a fair way to rival the great Carlisle mine, of the same district. The shaft is down to a depth of 80 ft and has been sunk all the way in ore. Only a few months ago the Norman went begging on the market; it was offered at the low price of $3,000, but no buyer could be found, until Mr. Farrish, Supt. of the Carlisle, had his attention drawn to it. He at once secured the mine, began development work, and now it could not be bought for less than $150,000.

VIOLA.—The Viola mill at Pyramid was started up Monday week and has been running steadily ever since. If the scarcity of water does not prevent, the mill will be kept in constant motion, as there is plenty of ore in sight in the mines there to keep it running for years to come.

LAKE VALLEY.—Lake Valley never had a brighter future than at present. With the mines opened up so as to produce 800 or 900 tons of high-grade, shipping ore per month, and a mill capacity of 40 or 50 tons per day to work all the ore running from 10 to 35 ounces she will soon regain all which was accorded her during the days of the famous Bridal Chamber.

OLD MAN.—Silver City *Enterprise*, Nov. 23: The anticipated sale of the Old Man mine to Jerome B. Chaffee, was not consummated. Chaffee and party left on Sunday for Denver, carrying with them favorable impressions of the mine. As we understand it, the offer of Mr. Chaffee was $100,000 for the mine and mill, under a working bond for 90 days, agreeing to expend $15,000 in developing the mine, leaving the high-grade ore on the dump and treating the low-grade as fast as extracted. Should the mine at the expiration of 90 days prove satisfactory the money was to have been paid, but proving the mine did not meet the expectations of the holders of the bond then they would withdraw, leaving the ore and developments in the hands of the company. This offer, which was made in writing, was rejected by Peter June, one of the locators of the property, and holder at present, of 20,000 shares of the stock. Other stockholders refused to allow their interests to go in at that figure and the sale was declared off.

OREGON.

NOTES.—Baker City *Tribune*, Nov. 20: A tunnel of 40 ft on the Egan shows a 12 ft vein, 2 ft of which is very rich in native copper; the vein assays 60 ounces silver per ton. The shaft on the Black Maria is down 100 ft, from which depth a cross-cut is being run to the foot wall. The cut is in 12 ft, through good paying ore the entire distance. The shaft on the Daniel Boone is sunk 50 ft, from which depth a level has been run 25 ft, showing from 1 to 4 ft of high-grade silver, assaying into the hundreds. A cross-cut, 80 ft deep from the surface, on the Black Hawk shows a ledge 40 ft wide, principally chloride of silver, the assays of which vary from 42 to 212 ounces per ton. While doing the assessment work on the Gray Eagle, adjoining the Lucky Boy on the northwest, John Dennet has exposed a 12 ft vein of chloride silver, and has not yet reached the hanging wall. A drift of 50 ft on the Kit Carson shows a 4 ft vein, ore similar to the Black Maria. Messrs. Peck & Eastabrook, owners of this mine, also own the Lucky Boy and Jay Gould mines. The latter shows a 10 ft vein, assaying high in copper and silver.

CALUMET.—Baker City *Tribune*, Nov. 16: Sol. Center, Supt. of the Calumet mines, in Union County, Oregon, has returned home after a hard summer's work developing this property. The mine is of copper, carrying much gold and silver. The ledge is a strong body of solid quartz, and a drift run across it 52 ft has not crossed the ledge. Work is suspended for the winter, owing to the snow. Ordinary assays of the ore yield $50 per ton in gold and silver, and from 10 to 60 per cent in copper. Picked specimens go as high as $250 per ton. The mine is so advantageously situated that the ore can literally be quarried out, and when opened a thousand stamp mill can be kept running day and night with the greatest ease. As soon as spring opens work will be commenced in good earnest and a 15-stamp mill will be erected, with rotary furnace and amalgamator. The ore is extremely free-milling and can be worked at an expense of $1 per ton, and with a large 200 ton stamp mill can be reduced at 40 cents per ton.

UTAH.

NOTES.—Park City *Record*, Nov. 24: There promises to be greater activity in mining matters during the coming year than for some time. Bob Pyper and James Baker have started a tunnel on the west side of the Empire Canyon, near the reservoir. The Sampson is putting in some splendid work on the mine and it is looking well in all the workings. Ore shipments will be regular this winter. The air compressor at the Daly shaft is being placed in position. Forty men are now employed. Mr. Pierson of the Pioneer, who was in the city yesterday, reports having struck the vein. He is as sanguine as ever of having a big mine. The bad weather has interrupted ore shipments this week, but as soon as sleds can take the place of wagons all along the line, shipments will increase. The boarding house of the Barry Con. is completed and work on the incline shaft is being prosecuted with vigor. The shaft was down 10 ft yesterday and is being timbered systematically. The Ontario is employing 300 miners and is in better condition than ever. The new developments in the west drift are a surprise to the management. The Apex shipped 30 tons of low-grade ore to the Mackintosh sampler this week, which went 20 ounces silver and 25 per cent lead. It is reported that there are 1,000 tons of this class of ore in the mine. The Crescent Co. have 70 men in their employ, and will probably increase the force. Since Colonel Hollister's big report on the Crescent 700 ft of work has been done and more ore is exposed than ever.

ONTARIO.—Southern Utah *Times*, Nov. 24: It is asserted by mining men who have been studying this camp, that the time will soon come when the Ontario vein will be producing for a distance along its length of 2 miles. In view of developments at Daly's works it would certainly seem as if the prediction would be verified.

INDIAN DISTRICT.—The work at Indian District has ceased for the winter. There has been a few tons of ore that will work $150 per ton, sacked, and it will be brought to Bristol. About 100 bags of concentrations have been shipped to the East from Bullionville to be experimented upon.

For Mining Shareholders' Directory, Stock Reports, etc, see page 372.

Collecting Flue Dust—No. 3.

The cost of constructing the flue was large in certain parts of it, on account of the difficulty of carrying the building materials up to the high ground where the flue was built. On comparing the cost of each part of the flue, it appears that the flat portion of Section IV., Fig. 9, as well as the large condensing chamber buildings, X and Y, Fig. 12, were the cheapest. It must be noticed, however, that two of the flues have nothing to do with the saving of the fine dust. One of these is the one which goes to the old chimney at Station 22, and carries the gases from the stalls used for roasting the lead matte. These stalls are used only a short time during the year. The other is the one used for the ventilation of the shaft-furnace house.

Around each one of the five Pilz furnaces, one meter from its outside and one and a half meters above the furnace-hearth, a sheet-iron cylinder two millimeters thick is placed. It is open below but closed above, and is joined to a pipe fifty centimeters in diameter. Each one of the pipes for the five furnaces passes through the charging-floor. They meet together outside of the building in a flue, which leads to the chimney L at Station 13, which chimney is 18 meters high and 43.5 meters above the charging floor. This furnishes sufficient draft to carry off the fumes.

In making the comparison of the material collected on every 100 square meters of wall surface and that of every 100 cubic meters of contents, the first four campaigns are particularly noticeable, as in these the relation of the square meter to the cubic meter, that is, to the mean section of the flue, has frequently changed. When the flues were first built they were made, as they usually are elsewhere narrow. Those more recently constructed, which have served partly to replace defective ones and partly for the increased production of the works, are made much larger than they formerly were. The mean section of the entire flue has in this way become constantly larger, so that when the old flues were finally destroyed the large section was taken as the normal one for the new ones.

Making a comparison of the quantity of lead collected per square meter of wall surface in the first four campaigns, a table shows that the quantities were nearly alike and varied regularly in very small quantities, while, on the contrary, the quantity collected per cubic meter during the enlargement of the flue was considerably less. From this the conclusion may be drawn that the material collected under such circumstances is proportional to the extent of wall surface, and that the cubical contents of the flue, including the chambers, has very little influence when the quantity of wall surface has undergone any change. These conclusions are fully sustained by the experiments formerly made with the two large condensing chambers X and Y, the increase of the cubical contents of the flue, owing to their addition, having been almost without influence.

The amount of dust collected on the bottom of the flue of the condensing chambers was always much higher on the sides than in the middle, owing to the fact that after a certain quantity is caught on the walls it falls to the bottom of the flue from its own weight, and is heaped up there. In the last two campaigns a very much more favorable result was obtained than in the four previous ones, owing to the fact that much greater attention was paid to the regulation of the draft by the damper in the chimney, which was kept closed, so that the furnaces had only just the necessary draft. The material contained in the gases had thus much more time to settle on the sides, and that which had already settled either there or on the roof was not unnecessarily detached from it. The proportional quantity of dust collected upon a square meter of wall surface under similar circumstances is necessarily smaller the greater the section of the flue, so that by increasing the wall surface from 10,710 square meters as in the fifth campaign to 22,650 square meters as in the sixth, to 23,791.14 square meters as in the seventh, and to 34,291.98 square meters as in the eighth campaign, the decrease of the material collected per square meter of surface is easily understood. The conclusion was therefore drawn, after the results of each period were known, that the wall surface of the flue might safely be enlarged, which was accordingly done. * * * * * * *

Up to this time reference has only been made to the lead contained in the dust. The other components, however, are of interest, especially the silver, as its value is always of some importance. The last time the flue was cleaned, the dust, according to an assay of 1,000 kilos., contained 51.86 grams of silver, so that the total

Amount of Silver Contained in the Dust

Was 48 kilos. If, however, the quantity of silver which is contained in the lead obtained from the roasted and smelted dust is taken as a starting point, the silver contained in 1,000 kilos. would be 72.11 grams, or, altogether, 67 kilos., which quantity is, therefore, the normal from which all calculations must be made. With regard to the repartition of the silver in each section, it is the greatest nearest the furnace, and then diminishes, at first rapidly, but after that very slowly. In the last campaign the amount of silver contained in the dust, according to an assay of 1,000 kilos., was:

At Station	I.	150 grams.
"	II.	50 "
"	III. Just behind the roasting furnaces	75 "
"	IV.	00 "
"	V.	45 "

From this point the silver diminishes gradually till at the end of the flue it is only 30 grams.

It appears very clear from these assays that in the beginning the dust contains a considerable quantity of particles mechanically carried off, which, on account of their weight, can only be transported a certain distance. When the draft is stronger they will be carried further, and its influence will be shown in the increase of these small particles of ore. This explains why it is that in former years, when there was no damper in the chimney, there was nearly half as much more silver in the flue dust as now. From the fact that the ratio of lead to silver in the flue dust is different from that in the ore, it is certain that in the discussion of this whole question the condensation of the volatilized material is by far the most essential consideration.

The dust contains between three and five per cent of zinc. In general it can be said that it is greater in the beginning than at the end of the flue. The difference, however, is not very great. The antimony contained is between .21 per cent and .40 per cent. It decreases very gradually in the length of the flue. The dust which is deposited on the bottom of the flue often contains 10 per cent more lead than that which is deposited on the arch. This observation has been confirmed every time the flue has been cleaned. The analyses of two samples of dust which was deposited by Station 46, more than 1,500 meters from the beginning of the flue, is given below:

ANALYSES.

	I.	II.
Lead	60.48 per cent	67.04 per cent
Zinc	3.17 " "	4.22 " "
Silver	.003 " "	.003 " "
Sulphuric acid	14.78 " "	14.07 " "
Sulphur	6.22 " "	5.42 " "
Oxide of iron) Alumina)	2.12 " "	1.00 " "
Carbon	8.00 " "	5.80 " "
Antimony	.42 " "	.31 " "
Arsenic	.24 " "	.10 " "
Copper	trace.	trace.
Lime	1.15 " "	.61 " "
Total	96 583 " "	98.633 " "

Assay No. I was taken from the arch, and No. II from the floor directly under it. The difference between these two will not be apparent when large masses are considered, for the dust increases in depth on the floor, because that which collects on the roof after a time gets heavy and falls to the ground on the top of that collected there, so that the results obtained by the analysis of a sample taken from a large quantity will be a mean of the two, and will not represent either the one or the other.

From these facts it is plain that the most important consideration is not that of collecting the particles of ore which are mechanically carried off, but of condensing and collecting those which have been volatilized and sublimed. Two separate means can be used for condensation, and these are the proper application of wall surface, and some method of cooling that surface. There is a limit to the possible cooling of the wall surface, and in any case this method can only be useful up to the point where the gases are reduced approximatively to the temperature of the outer air; beyond this point artificial means of producing the draft would have to be used. How far the flue can be cooled will depend upon the material used for the construction of the walls, and whether the flue itself is more or less buried in the ground.

The Limit of Methods of Construction

Lies between sheet-iron flues suspended in the air or laid on the surface of the ground and masonry flues buried entirely in the earth. The lowest point to which the gases can be cooled will be that which will give the necessary draft for the proper conduct of the furnace. The chimney must, therefore, be built either upon a high elevation or must itself be sufficiently high to produce the draft, or the gases at the foot of the chimney must have their velocity increased, either by bringing the gases at that point up to the requisite temperature or by causing the air to move by power. In the works at Ems little can be gained by the further cooling of the gases, as these at the foot of the chimney at Station 47 on the top of the hill have only a temperature of 64 degrees C., so that to increase the quantity of dust collected more surface must be provided. Since the intercalation of the last two chambers, which, with their necessary additions, have a surface of 8,815 square meters, it has been found necessary to open the damper of the chimney to 45 degrees. Formerly it could only be opened with safety to 27 degrees. There is little or nothing to be done further to increase the draft except to open the damper entirely, or to increase the hight of the chimney. As, however, all that is necessary now is to increase the wall surface, this can be done more quickly and cheaply by placing sheet-iron plates in the flues already constructed. This system was tried in Section XVI. from August 28th to December 24th, 1881. Four rows of sheet iron, No. 22, 100 meters long and one wide were hung in the flue. Taken together they represented 800 square meters surface; the collective wall surface of this division was, therefore, increased from 933 to 1,733 square meters. The quantity of lead contained in the ore and in the dust at this time was 3,028,565 kilograms. In the previous campaign, of the 6,748,816 kilograms of lead in the ore and dust which was treated, there were collected in Section XVI. 23,713 kilograms of dust. It was, therefore, calculated that with the increased wall surface from this arrangement of thin plates, 19,766 kilos. would be collected in this. The amount actually collected was 18,800 kilos., which was somewhat higher in lead than that collected in the previous experiment. The results of these experiments were so satisfactory that the number of plates was increased to six, as shown in Fig. 16. The quantity thus collected was so very large that in some of the sections of the main flue, notably in Figs. 11, 12 and 17, vertical plates 10 millimeters apart were introduced. As this method of construction costs only about one-tenth as much as the same amount of wall surface made with masonry, and allows of regaining more flue dust than the construction of long flues and condensing chambers without it, a patent for the improvement has been taken out in the name of the Ems Lead and Silver Works, which has proved not only useful for metallurgical but also for chemical and other manufacturing works where metals are likely to be volatilized. It is also probable that its use will be found advantageous in the manufacture of zinc white, the treatment of ores of mercury and other volatile substances, where the main object of the treatment is the condensation of the volatilized metals.

Nickel and Sulphur.

Nickel unites with sulphur in three proportions, yielding thereby a di-nickelous sulphide (Ni_2S), a protosulphide or nickelous sulphide (NiS), and nickelic disulphide (NiS_2).

Di-nickelous sulphide (Ni_2S) forms a pale yellow, brittle, magnetic, and readily fusible body, produced when the sulphate of nickel is reduced in a current of hydrogen gas.

The *protosulphide of nickel* or *nickelous sulphide* (NiS) constitutes the most important combination of these elements, occurring native as nickel pyrites or capillary pyrites described under the ores of nickel. It also results when sulphur is fused with finely-divided nickel, likewise when sulphur acts upon oxides of nickel heated to redness, or when nickelous oxide is ignited and reduced by a current of sulphuretted hydrogen. An impure variety also results upon the reduction of nickelous sulphate by carbon. The direct union of nickel and sulphur is attended with the production of light, the combination taking place with considerable violence, and at a temperature below the melting point of sulphur. This sulphide is a brass yellow body, with a metallic lustre; it is decomposed by ignition in air or when heated in chlorine gas, but not by hydrogen at a red heat; and it is not so readily fusible as the sulphide first described.

A *hydrated* nickelous sulphide is precipitated as a dark brown or black precipitate upon the addition of ammonic sulphide to a neutral solution of any salt of nickel; but it oxidizes by exposure to the atmosphere, with the production of a soluble sulphate, and it is also sparingly soluble in an excess of ammonic sulphide. If heated out of contact with the air the hydrated sulphide parts with its water and yields the anhydrous sulphide.

Nickelic disulphide (NiS_2) forms a steel-grey powder when a mixture of nickelous carbonate, potassic carbonate, and sulphur is heated to dull redness. It is decomposed by chlorine with the production of the chlorides of nickel and sulphur.

The Determination of Copper in Steel

The following paper was read by Magnus Thorlius before the American Institute of Mining Engineers: The following is a very rapid method of determining copper in steel. I have found it to give results very closely agreeing with those obtained by galvanic precipitation of the copper.

Five grams of steel are dissolved in a mixture of 100 c. c. of water and 100 c. c. of sulphuric acid. When all is dissolved, add 2 c. c. of a concentrated solution of hyposulphite of soda, and stir well. After 15 minutes' boiling, all the copper is down as black sub-sulphite of copper (Cu_2S) and the solution regains its greenish color. Filter rapidly, wash a few times with hot water, pierce the filter, and wash the precipitate back into the beaker in which it was made.

Dissolve in a little aqua regia and evaporate with about 2 c. c. of sulphuric acid, until white fumes appear. Dilute with water, heat to near boiling, and add excess of ammonia (sp. gr. 96). Allow to settle in a warm place filter and wash with hot water containing some ammonia. From the filtrate evaporate the excess of ammonia, add a little dilute sulphuric acid till it is slightly acid, and precipitate the copper as before, with a few drops of hyposulphite of soda. Filter on a washed filter-paper, wash with hot water, place the wet filter in a weighed porcelain crucible, ignite and weigh as oxide of copper (CuO).

When an ordinary Bunsen burner is used, care should be taken not to let the crucible come into contact with the inner cone of the flame.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANKS, State Mineralogist.]

[CATALOGUE.]

5065. Silver Ore—Advance mine, Monitor district, Alpine county, Cal. Geo. F. Beardsley.
5066. Gold Quartz—Oakland mine, Grass Valley, Nevada county, Cal. Oakland Gold Mining Co.
5067. Gold Quartz—Padre mine, Carga Muchacho district, San Diego county, Cal. Seupham & Childs.
5068. Gold Quartz—Madre mine, Carga Muchacho district, San Diego county, Cal. Seupham & Childs.
5069. Cement with Gold—Nice & West mine, Nevada county, Cal.
5070. Gold Quartz—Akin or Virginia mine, near Coulterville, Mariposa county, Cal.
5071. Ore containing Free Gold—Juniper mine, Hayden Hill, Lassen county, Cal. Hon. John Daggett.
5072. Gold Quartz—Poule mine, Clipper Gap, Placer county, Cal. Henry C. Hyde.
5073. Silver-Gold Ore—Julia mine, Lake district, Mono county, Cal.
5074. Pyrolusite—Stonewall mine, Tombstone district, Pima county, Arizona. Said to be argentiferous. J. G. Manning.
5075. Silver Ore—Ingersol Consolidated mine, Tombstone district, Pima county, Arizona. J. G. Manning.
5076. Silver Ore—Phœnix mine, Tombstone district, Pima county, Arizona. J. G. Manning.
5077. Silver Ore—Way-Up mine, Tombstone district, Pima county, Arizona. (See Nos. 2015-2485.) J. G. Manning.
5078. Quartz Breccia, Picket Post, Pinal county, Arizona.
5079. Volcanic Rock, which crops out in immense masses near Picket Post, Pinal county, Arizona.
5080. Sedimentary Sandstone—Seal Rock, off Point St. George, northwest boundary of Cal. Col. R. S. Williamson, U. S. Engineers.
5081. Sandstone—West side of the Great Eastern Quicksilver mine, Sonoma county, Cal. Supposed to be the foot-wall. (See No. 2744.)
5082. Footwall of the Great Eastern Quicksilver Mine—Sonoma county, Cal. Two hundred and twenty foot level. (See No. 5081.)
5083. Limestone—Near Auburn, Placer county, Cal. Geo. W. Kimble.
5084. Cellular Lava with Zeolite—Solidad Canyon, Los Angeles county, Cal. G. D. Keeney.
5085. Rock Specimen (undetermined)—Corner Pine and Powell streets, San Francisco, Cal.
5086. Gneiss—Said to be found in San Francisco in places, but this needs confirmation. William Robinson.
5087. Chalcedonic Quartz (Banded)—Santa Rita Mountains, Pinal county, Arizona. J. G. Manning.
5088. White Dolomite—Tujunga Canyon, seven miles from San Fernando, Sierra Gabriel Monatahs, Los Angeles county, Cal. Valuable for building and manufacturing purposes.
5089. Cement Rock, impure Carbonate of Lime (?)—Hill west of road to Weston's Canyon, San Gregorio Pass, San Bernardino county, Cal. Welwood Murray.
5090. Clay, overlying Cement Rock No. 5089—San Gregorio Pass, San Bernardino county, Cal. Welwood Murray.
5091. Rock Specimen—Woodford's, Alpine county, Cal. Edward Barnes.
5092. Rock Specimen, Country Rock—Silver King mine, Pinal county, Arizona.
5093. Rock Specimen, fine Sedimentary—Town of Los Angeles, Cal.
5094. Porphyry, in 10 varieties—Florence, Pinal county, Arizona. From the bed of the Gila River.
5095. Volcanic Rocks, 13 varieties—Bed of the Gila River, near Florence, Pinal county, Arizona.
5096. Red Jaspery Rock—Bed of the Gila River, near Florence, Pinal county, Arizona.
5097. Crystalline Rocks, in 3 varieties—Bed of the Gila River, near Florence, Pinal county, Arizona.
5098. Building Stone—Used in Portland, Oregon.
5099. Silver Ore—Sultana mine, 40 miles from Salem, Linn county, Oregon.
5100. Silver Ore—Monumental mine, Oregon.
5101. Silver Ore—Sheridan mine, Grant county Oregon.

Gallatin County, Montana.

Since the ratification of the treaty made with the Crow Indians, that part of their reservation which included the Clark's Fork mines is now comprised within the limits of this county.

While the first operations inaugurated in that locality were not in any degree satisfactory, later developments have proved that good grades of ore can be secured in abundance. The first smelting done was principally from the great bowlders of galena found upon the surface, and which happened to carry very little silver. As the lodes were opened and ores extracted from below the surface, it was found that many were exceptionally rich, and the fact is now established beyond question that the New World district will develop into importance as a mineral-producing region in the history of Montana.

The smelter built by the Eastern Montana Mining and Smelting Company has been renovated, and during the latter part of the season of 1882 did some successful work in reducing the ores taken from the lodes which produce those of good grade.

Among the best known and most promising lodes of that region are the Great Republic and the Black Warrior, the former being the widest and most regular, but the latter carrying the highest grade of product. The requisite fluxes for the smelting of ores are found there in abundance, and the percentage of lead desirable can be found in almost any of the ores extracted from the mines to the depth reached in the present stage of development.

The placers found in Emigrant have doubtless produced more gold than any other gulches worked in this county. Of late years the amount realized has not been large, but there is no falling off in the returns. Three parties worked in that gulch during the last season, and from the most reliable information at command the aggregate clean-ups will not be less than $12,000. Some have estimated the amount realized from that locality during 1882 at not less than $30,000.

Bear and Crevice gulches have also been worked to a limited extent, and Brown's arastra has continued to add its quota of gold to the general yield, from ores supplied by the narrow but rich gold lodes of Bear and Crevice mountains, where there are about fifty recorded locations.

Placer mining has been done on the Bowlder, which is now the boundary of the Indian reservation, and many quartz locations have also been made; but until there are better facilities at command for the successful treatment of the ore produced, the hullion yield of Gallatin County will remain insignificant in comparison with the acknowledged resources which it has developed.

Without estimating the lead value in the bullion, the yield of the county in gold and silver during 1882 was not less than $30,000.

Mica.

Occurrences.

Muscovite mica, varying greatly in quality and the size of sheets, occurs in nearly all of the granitic, gneissoid, and schistose areas of the country. At present North Carolina takes the lead in point of production. In that State, since 1868, mica has been mined in many places, and has been obtained in plates sometimes over 3 feet in diameter. Numerous localities exist in Macon, Jackson, Haywood, Buncombe, Ashe, McDowell, Yancey, Alexander, Cleveland, and other counties. Merchantable mica is also found in many other of the South Atlantic States. A considerable amount is mined in Maine and New Hampshire. A recent discovery, said to be important, is announced to have been made in Salisbury township, Pennsylvania. At South Mountain, in the same State, a new mine has been opened, which is said to have produced pieces of good mica weighing from 19 to 27 pounds, some of which could be split 160 times to the inch.

Mica is found in numerous States and Territories contiguous to the Rocky Mountains. In a few localities it occurs in medium sized plates of good quality; but in this region only the mines of Deadwood, Dakota, and one mine near Las Vegas, New Mexico, have shipped any mica to market. The McMaken mine, near Deadwood, had sold up to May 140,000 pounds of merchantable mica, and the Sundog, Black Hills, and other mines have shipped small quantities. The mica from these mines is of excellent quality, and plates are sometimes produced 12x18 inches in size. The main ledge is said to be 14 feet wide, and to consist of a central mass of feldspar and "porphyry," with a casing of mica, which varies in width from 3 to 4 feet, on each side. The country rock is granite. These mines have hitherto been developed only by open cuts, and until recently have never been steadily worked.

In Wyoming mica occurs occasionally in plates 4x6 inches in size, and of good quality; but the supply is extremely limited. In Colorado good plates of mica have been found in Bowlder, Jefferson, and Fremont counties, but only in very small quantities. In New Mexico, near Las Vegas, it is said to occur in considerable amount, some of the plates being 8x14 inches; but, although found in large quantity, only a few small pockets produce sheets of marketable size. One small shipment has been made.

Mica of excellent quality has also been discovered on the Payette River and in other localities in Idaho. Local excitements about mica claims are frequent in Nevada; but thus far there has been no actual production. A number of claims were located in the southern portion of Nye County during the past winter.

Deposits of mica are found in nearly every county in California, and in many of the mining districts, and at various other points on the Pacific Coast. As a general thing, however, it is of somewhat inferior quality, though some quite clear and in large sheets has been discovered. No regular mica mining is done in this portion of the country, though several deposits have been opened with the hope that systematic developments would ultimately be made. Still, the local market is quite limited, and there has been no encouragement for miners to open the deposits they have found.

Prospectors in search for gold and silver in Alaska report that deposits of mica are numerous in that Territory.

The total production in 1882 is estimated by Messrs. Munson, Rolls & Co. at 75,000 pounds of sheet mica, with a total value of $250,000, which would give an average of $3.33 per pound. There is little doubt that the product will be largely augmented by the recent important discoveries, especially those in the Black Hills region.

The clear, transparent, and tough mica plates are used in various ways, the principal utilization being for stove and furnace doors. A small amount of specially fine mica is used for compass plates. Mica generally occurs in plumose or scaly form, rendering it valueless for its best known uses. These varieties are pulverized and used as an absorbent in one variety of nitroglycerine explosives, and enter also into a patented lubricating composition for axles and bearings. Ground mica is also employed for various ornamental purposes. Scrap mica and trimmings from the better kinds are pulverized and utilized in the same way as the inferior varieties. The demand for ground mica, however, is comparatively small, and the supply of mineral suitable for the purpose to which ground mica is applied is abundant.

The price ranges from 25 cents to $5 per pound, according to the size of sheets and quality. Some exceptionally large and clear sheets from North Carolina have been sold at $10 per pound; but mica of this grade rarely comes on the market.—*Mineral Resources of U. S., by Albert Williams, Jr.*

NEW HOOP-MAKING MACHINE.—A Bostonian has invented a hoop-making machine which, it is said, makes from 20,000 to 30,000 half-round hoops a day, cutting two, three or four from a pole, as occasion requires. One of the results of the introduction of this new machine will be the utilization of ironwood saplings for hoops. This tough and almost indestructible wood, which resists the tools of the cooper, is said to be handled without difficulty by the Boston hoop-making machine.

USEFUL INFORMATION.

Choice of Lubricating Oils.

The quality of the lubricant will be governed to a certain extent by the character of the machinery to which it is applied, that is, whether upon light or heavy bearings; whether these are given high or low velocities, etc.; so that an oil that might serve admirably under certain circumstances would not necessarily be the best when these conditions were very different. The weight of testimony, however, as to the relative merits of the animal and vegetable oils in comparison with the mineral oils appears to incline in favor of the latter on the score of general applicability.

For example, Spon is authority for the statement that the best oil is that which has the greatest adhesion to metallic surfaces and the least adhesion in its own particles. In this respect, he asserts, fine mineral oils stand first; sperm oil, second; neat's foot oil, third; and lard oil, fourth. Consequently, he concludes, the finest mineral oils are the best for light bearings and high velocities. The same authority adds that mineral oils alone are not suited to heavy machinery, on account of their want of body, but well purified animal oils are applicable to the heaviest machinery.

Thurston, who is eminent in this specialty, is unqualifiedly favorable to the mineral oils for all species of service. On the score of their adaptability for heavy bearings, he makes the statement that pure natural West Virginia oil, 29 deg. Beaume, is suitable for all kinds of heavy machinery. It is preferred by many consumers to sperm or lard oils. And again, oil of heavy body (that is, mineral oil) and a fire test of 330 deg. to 350 deg. Fah. is often used for railroad-car axles, heavy machinery, locomotives, or for any purpose where great heat is to be provided against, and for bearings where heavy weight is sustained. It has excellent wearing qualities, and will lubricate and keep car journals and heavy bearings cool when oils of a lower fire test would volatilize. For factory use, high speed, with both heavy and light bearings, and wherever the lubricator is fed to bearings by capillary attraction, it is (when properly refined) a good lubricant.

The following general summary of the subject of the qualities and comparative merits of these two classes of lubricants, from the same authority, will be found to have interest. It is as follows: All vegetable and animal oils are compounds of glycerine with fatty acid. When they become old decomposition takes place, and the acid is set free, by which action, as is commonly said, the oils become rancid. This rancid oil will attack and injure the machinery. Again, all animal oils contain more or less gummy matter, which accumulates when exposed to the action of the atmosphere, and will consequently retard the motion of the machinery. Mineral oil does not absorb oxygen, whether alone or in contact with cotton wool, and can not therefore take fire spontaneously, as animal and vegetable oils do. The consumption of petroleum, or mineral lubricating oils, is largely increasing; they are used on all kinds of machinery; they are the safest and cheapest lubricators, and superior to animal and vegetable oils and greases; they are safer on account of their non-oxidizing properties and their high fire test and the heat they will resist before vaporizing; they are cheaper in price and more economical, saving both machery and fuel; they are more reliable, because they are entirely pure and always uniform in quality; they last longer and work cleaner; they are perfectly free from acids and every impurity; they neither gum, stain machinery nor manufacturers' products. As this inquirer will perceive from a reading of the above, a more emphatic indorsement of the mineral oils as lubricants would scarcely be possible.—*Manufacturer and Builder.*

THE REBACKING OF PAINTINGS.—A Washington letter describes the *modus operandi* of taking off the old canvas of some of the great paintings hanging in the Capitol rotunda and substituting new. The picture is laid upon its back on the floor, and a sufficient thickness of cartridge paper gummed on the face to prevent injury. It is then turned over and the old canvas scoured off with pumice stone. This is a tedious operation requiring much care. The new canvas is stretched and covered with a thick, adhesive substance, which penetrates every part. The back of the painting is then covered with a more fluid mixture, when the canvas is laid upon it. The whole is turned over, the face of the picture coming uppermost. Small flat-irons, heated to a temperature that will hasten the drying of the glues without injuring the paint, are passed carefully over the surface, the cartridge paper preventing harm. Towards the close heavier irons are used. The paper is then moistened and removed, when, after imperfections have been touched up, the picture is returned to the wall.

TO REMOVE A TIGHT-FITTING RING.—A novel method of effecting the removal of a ring which has become constricted around a swollen finger, or in any other similar situation, consists in enveloping the afflicted member, after the manner of a circular bandage, in a length of flat India-rubber braid, such as ladies make use of to keep their hats on the top of their heads. This should be accurately applied, beginning, not close to the ring, but at the tip of the finger, and leaving no intervals between the successive turns, so as to exert its elastic force gradually and gently upon the tissues underneath. When the binding is completed, the hand should be held aloft in a vertical position, and in a few minutes the swelling will be perceptibly diminished. The braid is then taken off and immediately reapplied in the same manner, when, after another five minutes, the finger, if again rapidly uncovered, will be small enough for the ring to be removed with ease.

WATER FOWLS AS BAROMETERS.—In a new book called "The Fowler in Ireland," Sir Ralph Payne Galwert states that the movements of the water fowl indicate approaching changes in the weather more surely than any barometer. Thus, if ducks fly but a short way after a shot, a violent gale may be confidently expected. "Snipe, like duck, will rest and feed in prospect of a disturbance of the elements. When the gale comes roaring down, perhaps accompanied by rain or sleet, these birds will rise from their retreat and whirl about like dead leaves in a murky sky." An arrival of wild swan intimates a severe frost. If they leave suddenly as they came, the weather will turn mild again. Herons will break away from their fishing when it is coming on to blow from a certain quarter, for they dislike beating homeward in the teeth of the wind.

GUM ARABIC.—In Morocco, about the middle of November, a gummy juice exudes spontaneously from the trunk and branches of the acacia. It gradually thickens in the furrow down which it runs, assumes the form of an oval or round drop, as large as a pigeon's egg, of different colors, as it comes from the red and white gum tree. About the middle of December the Moors encamp on the border of the forest, and the harvest lasts a full month. The gum is then packed in large leather sacks and transported on the backs of camels and bullocks to seaports for shipment. This is the gum arabic of commerce.

A CURIOUS INCIDENT occurred in Dallas, Ga., recently. A bale of cotton was taken to a compress to be weighed and stored. When put on the scales it was observed that the bale was warm. The trier was inserted and the bale found to be on fire in the center. It was taken out, and when opened burst into flames. Some considered it a case of spontaneous combustion, others that a spark might have fallen into the bale from the gin. At all events, the occurrence was uncommon.

GOOD HEALTH.

How Old People Die.

Most old people die from overfeeding or exposure. In old age the resisting power of the system is very greatly lessened, and a degree of exposure or indiscretion which might have been borne with impunity a few years earlier in life may be sufficient to disturb the vital machinery sufficiently to produce fatal results. Excess in eating is perhaps a more general cause of hastening dissolution in the old than any other form of excess. The diminished bodily activity renders less food necessary to supply the wants of the body; and when the amount of food taken is not proportionately reduced the system becomes clogged, the blood gross, excited, and filled with imperfectly elaborated material; the blood-vessels are surcharged, and, in consequence, the liability to apoplexy or some other form of paralysis is very greatly increased. Heavy feeding is absolutely dangerous for a man above fifty years of age. The blood-vessels are weakened in old age, sometimes to a very remarkable extent; and the fullness and congestion of the brain which result from excess at the table are almost as fatal as a dose of strychnia or a leaden bullet.

Excess in the use of meat is especially to be condemned in elderly persons. Flesh food is stimulating to the cerebral circulation, at the same time that it produces a tendency to plethora. Statistics show that the chances for life are much better for an elderly person in this country than in England, which may be attributable to the excessive use of flesh food in that country.

At this season of the year old people need to take special care to avoid getting chilled. Cold is one of the most deadly enemies of old age. A large share of the elderly people who die succumb to the influence of cold, inducing pneumonia. An abundance of warm clothing, with warm but well ventilated rooms, is essential to the old during the cold season of the year, and they should avoid the exposures which younger persons may endure without injury.—*Herald of Health.*

WORK A LAW OF NATURE.—Work is so thoroughly a law of nature for a man as well as animals, that any organ left inactive decays from day to day. Thus the well-being of an organ is indissolubly connected with its activity. One of the most curious illustrations of the above principle is the reaction which the amputation of a limb exercises on the brain. That organ regulates the movements of every member of a healthy body; but if one member be wanting, then the respective portion of the brain has nothing more to do, and consequently exhibits a tendency to wither away. Several instances have already been recorded which indicate a probable injury to the brain, resulting from deficient activity in some portion of the body. And now M. Bourdon has communicated to the Paris Academy of Medicine a case of brain-wasting arising from the amputation of a limb. A soldier, whose left arm had been removed some forty years ago, lately died from inflammation of the brain, after thirty-six hours illness, and the post-mortem examination showed that one side of the brain presented differences from the other. During the late years of the man's life the leg corresponding with the amputated arm gradually became lame, the injury done to the brain having, it is considered, reacted upon the leg.—*Sel.*

GIVE UP MEDICINES.—How precious is health! Wealth, honor, luxury, associations and friendships are of less value than health! Thousands of highly educated persons exclaim, "I would give ALL *for health.*" Multitudes who can talk intelligibly of nebulæ, leucocites, monads, and of equations, have become a trial to themselves and their friends, are fretful, hysterical, sensational, and even lax in morality? What is to be done? First, stop medicines of all sorts! Give up the gauntlet of tonics, stimulants, alteratives, sedatives, diaphoretics, antispasmodics, diuretics and neurotics, which have been applied in every conceivable way to the gastro-pulmonary and genito-urinary surfaces, to the nasal and serous membranes and external skin. Give up your liver pads, supporters, specifics, and relate yourself properly to nature's *materia medica!* Give up your blue mass, quinine, iron, ipecac, opium, chloral and bromides, and you have made the right start!

Now try to take hope into your soul! *Believe* you may become well, vigorous and useful, for it is true the most of you are curable.

Second. Put yourselves in proper relation to "deep breathing," sunlight, food, dress, sleep, motion, rest, water and self-hood! Do this at home, or in the best institution you know: it will make no difference, only so you continue and persevere in doing it.—*Herald of Health.*

THE GRAPE CURE.—The season for the grape cure begins in Europe in August, and continues from two to three months. Patients go to establishments in the vicinity of the vineyards, and, giving up their pipes, beer and flesh food, live on bread and grapes, or sometimes on grapes alone, from four to six weeks. In cases to which this cure is adapted the change for good is often wonderful. Gouty, rheumatic and over-fed persons improve most. The business is reduced to a system there, and physicians prescribe for patients at the cures as to amounts of grapes, variety, and length of time to continue it. There are in Europe a multitude of water cure and other health institutions which practice the grape cure at the proper season. Some of them are located in the mountainous regions, where patients can constantly behold most magnificent scenery, live in the forests and breathe the best of air. In this country we have excellent facilities for the grape cure, and hundreds have practiced it without medical advice, to great advantage.

THE PECK OF A HEN.—A short time since Mrs. John Preston, of Gwynedd, England, was pecked by a hen on the index finger of her right hand. The blow did not break the skin, but caused a very slight bruise. Nothing was thought of so trifling a wound until a few days after it was inflicted, when the finger began to pain and swell. The pain increased until it became almost unbearable, and the swelling did not cease until it had extended up the arm to the shoulder, when the finger burst from the knuckle-joint to the tip, and began to discharge a purulent substance, and has been doing so to the time of this writing. The swelling in the arm has subsided, and the wound is much less painful than at first. Although the patient has been under constant treatment by a skillful and successful physician from the first, the sore shows but little evidence of healing, and renders the patient almost powerless to do any thing. The case is certainly a remarkable one. Mrs. Preston is over 60 years of age.

ORIGIN OF SCARLET FEVER.—One of the most interesting medical theories yet broached is the hypothesis that scarlet fever originated with the horse and that inoculation from this animal may possibly be used as a preventive to the dreaded disease in the human being. Dr. John C. Peters, of New York City, who has prosecuted careful studies into this subject, is thoroughly convinced that he is right in his hypothesis, and he believes that it will be possible to reduce the equine virus by cultivation, so that healthy children may be inoculated against the disease.

A GOOD EXEMPLAR.—M. de Lesseps, the eminent French engineer, rears his children in the greatest simplicity. In diet, dress, and all habits of life, he endeavors to make their conditions as nearly natural and healthful as possible. He attributes his own remarkable vigor and vitality at an advanced age to the fact that his father entertained the same views respecting child rearing, and brought him up "like a young savage," at least in many respects. He asserts that "the children of the rich are over-fed, over-dressed, and under-exercised."

Passing Events.

This number of the PRESS contains a brief history or record of the firm of Dewey & Co., its publishers, which appears on the occasion of the 20th anniversary of the firm. The event was duly celebrated, as appears in another column.

Aside from what we have noted in our "Mining Summary," there is little to report concerning the mines. In this season of short days there is very little outside prospecting going on, except in the southeast and the southern part of this State. It is to be noted that of late miners have turned their attention more than usual to minerals which have before been considered comparatively valueless. This is good for the country, and our general mineral resources.

CABLE RAILROAD SUIT.—The Cable Railway Company has commenced suit against the Market Street Railway Company for infringement of patent. The Cable Railway Company are owners of the Hallidie patents, and it is claimed that these are being infringed. The suit is for $100,000 damages.

ON Monday the Idaho Mining Company declared a regular monthly dividend of $4 per share, amounting to $12,400. This is an increase of $2 per share over the November dividend. The mine is looking and yielding well.

A PROFESSORSHIP of German Language and Literature has been established at the State University, Berkeley.

Nickel in Lower California, Mexico.

Some years ago a vein of metal was found near the Real del Castillo, Baja California, 100 miles southeast of San Diego, which was supposed to be silver. Two samples were taken, which, when melted in a blacksmith's forge, yielded a large button of metal. This was tried for silver and for gold, but proved to be neither. A gentleman who happened to see it, at once pronounced it nickel. Nothing more was done about it at the time. A year ago the superintendent of the old Tunnel Company examined the ore and pronounced it nickel. A few weeks since Prof. Blair visited that section and at once discovered several large veins of good nickel ore. Some of the old gold mines carry gold, silver and nickel. Some of the new discoveries are of the same class; others carry silver and nickel, and others nickel only. Copper, arsenic, cobalt and antimony are more or less intermixed as bases. One of the veins is the arsenide of nickel, containing from 20 to 45 per cent nickel; another vein contains kupfer nickel, which runs from 35 to 40 per cent in nickel. Another carries nickel glance, yielding from 25 to 40 per cent of nickel, and another carries Emerald nickel, yielding from 20 to 35 per cent in nickel. These veins are from 3 to 8 feet wide. The mines are very accessible, being reached by a good wagon road. Three of them are within a mile of town, through which the survey of the "Bee Line" railroad passes—a road contemplated, and for which charters and subsidies have been granted—from National City, California, to the Mexican boundary line at Tia Juana; thence via the Real del Castillo, mouth of the Colorado river, Altar, in Sonora, to Magdelena. From there 20 miles will be built this winter, west towards Altar. Surveyors are now running a line from Magdelena east to cross the Mexican Central 100 miles north of the Chihuahua to Monterey, and thence to the Gulf of Mexico. The "Bee Line" railroad will pass within a mile of several of the new nickel mines.

Coal has also been discovered within three miles of the new mines. The coal is in veins or layers from 3 to 11 feet thick. Its quality is not yet known. It is probable that this new nickel belt extends southerly. Prof. Blair thinks that it covers the great mineral belt of the "Lost mine" which produces so much mineral, and has been assayed so many times for gold, silver and copper, and yet none found, and still no one has yet told what the metal was or is, except in one case. A sample of ore was sent to a good assayer who gave 15 per cent in nickel, $15 in silver and $17.50 in gold; and his sample was the average of the poorest mine in the district. It is the plan of Prof. Blair and his associates to further prospect and open the nickel veins. Some of the veins can be traced on the surface for more than a mile, the croppings, in places, reaching 6 or 8 feet above the surface, and 6 to 8 feet wide. The new discovery promises to open a new field for nickel.

Talc.

Although talc is known to occur in many places on this coast, it is not mined, as is the case in several States on the Atlantic seaboard. Pennsylvania is the principal producing center. The substance is used quite extensively in soap making, and for dressing fine leather, sheepskins, gloves, etc. The domestic talc is used instead of terra alba in the manufacture of paper. A small amount of talc also enters into the composition of some lubricating compounds.

By some persons it is estimated that as high as 50,000 tons of talc were mined last year, but official sources consider this estimate too high. The average spot value is about $12 per ton. The imported talc, of which $20,960 worth was received in the fiscal year 1882, is of generally superior quality, and the average price is about $22. What we import comes from Italy, Austria and France. It is found in several places in Arizona and in this State.

Talc is a soft magnesian mineral, of a soapy feeling, and usually of greenish, whitish or grayish colors, occurring in foliated or easily cleavable masses, and also in compact granular masses. In the latter condition it is called steatite or soapstone. Indurated talc is an impure slaty talc, with a nearly compact texture, and superior hardness to common talc.

Posting Location Notices.

Some little time ago some miners took up a claim of the ordinary dimensions. The discovery was made by tunnel, the position of which is on the southern side of the claim. Due notice of the application for patent was made by publication and posting of notice in the Land Office. A diagram of the claim and notice of application were also posted "in a conspicuous place, upon a tree about five or six feet east of the mouth of the discovery tunnel, where it could be easily seen and examined." The tree upon which the notice was posted was within the limits of the claim, but the location conflicted with another mineral claim to the extent of little more than half an acre. The mouth of the discovery claim laid within this area, which was excluded from the pending application. The tree on which the posting was made also stands within this tract.

The contestants—the owners of the other claim—tried to stop the men from getting the patent by calling the attention of the Land Office to the provisions of Sec. 2325 of the Revised Statutes, viz., that the applicant "shall post a copy of such plat, with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat, previous to the filing," etc. And they contended that as the notice was not posted on the land actually applied for, the application for patent should be dismissed.

The matter was referred to the Commissioner of the General Land Office, who considered that the objection was insufficient to warrant the office in dismissing the application. The law requires that the posting on the claim shall be performed before application for patent is filed, and in a conspicuous place, on the land embraced in the survey. The plat of the survey embraced the entire claim, and the posting was on the land embraced in the plat. The fact that the application subsequently filed excluded that part of the land on which the notice was posted does not vitiate the notice. The posting was evidently in a conspicuous place, hard by the mouth of the tunnel, and thus the letter and spirit of the law were observed.

New Ore Screen.

A form of ore screen lately devised is made of broad-headed bars, the heads of which are of the same width from end to end, combined with supporting-bars, separating-washers and tightening-nuts and screws. The screen plates or bars are provided with broadened heads, and near each end have a hole formed in the body to receive the rods on which they are strung. Spacing-washers, formed with a flat space on top, are interposed between each pair of plates. The rods pass through these washers also, and at each end the rods are screw-threaded and provided with a tightening-nut, which, when screwed up, binds the bars and spacing-washers securely together.

The broadened heads of the bars are formed of the same width the entire length of the bars, and the bars are so mounted that the spaces between them shall be the same. This way of mounting bars is the usual one; but the T-headed bars commonly in use have had the heads tapered, being broader at one end than the other, and consequently the spaces between them varied in width from one end to the other. V-shaped bars have also been set up in this way, so that the spaces at one end shall be broader than at the other. In ore screens it is necessary that the bars retain their exact position; and separately-formed, broad-headed bars mounted to attain this end, combined with equidistant spaces, is a construction considered new by the Patent Office.

AN IMPORTANT LAND DISPUTE SETTLED.—The three-cornered fight which has been going on for a long time between M. M. Nathanson, D. S. Jones, and the heirs of J. R. Snyder, over a valuable tract of land lying contiguous to the north boundary of Sonoma, has been finally settled on appeal to the Secretary of the Interior. The Commissioner of the General Land Office decided in favor of Jones and Snyder's heirs, thus depriving Nathanson of the portion of the land on which he settled in 1855, and which he had continued to hold, cultivate and improve up to the present time, the whole tract being awarded to Snyder's heirs, with the exception of a small part held and cultivated by Jones since 1858. From the decision Nathanson appealed to the Secretary, who awards the land to Nathanson, except the portion cultivated and improved by Jones. Messrs. A. H. Evans & Co., of Washington City, appeared as counsel for Nathanson.

A Progressive Firm.

Dewey & Co.'s Twentieth Anniversary.

Last Saturday marked the 20th anniversary of the firm of Dewey & Co., publishers of this journal. In a comparatively new country like California, and in these days of rapid changes, twenty years is a long period over which to look back on the existence of a business house. The firm of Dewey & Co., publishers and patent agents, had its starting in the first issue of the SCIENTIFIC PRESS in December, 1863; and under the name of the MINING AND SCIENTIFIC PRESS the paper has been prosperously continued until now. With very few exceptions it is the oldest journal in this city or on the coast, and is the oldest mining paper in the United States.

W. B. Ewer and A. T. Dewey, the present owners of the paper, became proprietors in 1862 and 1863 respectively. Mr. George H. Strong, partner in and manager of DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY, was then associated as chief draftsman and mechanical expert of the concern.

The Patent Department.

At the time of the organization of the firm the field in the patent business was very small indeed, most of the patents for this coast then being taken out by the Eastern agencies. It gradually became apparent to inventors, however, that there were decided advantages in being able to hold personal council with their agents and to examine the drawings and specifications before they were submitted to the Patent Office. It was, moreover, seen that a great saving of time was effected, there being no delay in the forwarding and return of papers for signatures, as was the case when dealing with distant agencies. Within a few years a steadily increasing business was built up, and the MINING AND SCIENTIFIC PRESS Patent Agency became the leading agency of the kind on the coast, a position it has maintained ever since. This has been accomplished by careful attention to the wants of inventors and a well-earned reputation for reliability, honesty and fairness.

The clients of this department of the firm are scattered from one end of the coast to the other, and a great number of them have done their business with Dewey & Co. for years. Nearly every important patented device on this coast in the last twenty years has been obtained by us. The peculiar machinery of this coast, mining and metallurgical appliances, harvesting machinery, cable railroad mechanism, etc., have been specialties with which the firm has had more to do than other agencies, and the knowledge acquired in handling all this business has been of incalculable advantage to inventors. During the years of existence of the firm a very valuable library has been accumulated, including works of reference, Patent Office reports, volumes of complete specifications and drawings of all U. S. patents, etc., until it has assumed large dimensions.

The Publishing Department.

The publishing department of the firm has increased in importance from very small beginnings until now there are some 40 employees in all connected with it. When the MINING AND SCIENTIFIC PRESS was first published it consisted of eight small pages. For many years it has been a sixteen-page illustrated journal, known and admired in every camp and city in the West. As an exponent of the industrial, mechanical and mining resources of the coast it holds the first place, and is acknowledged an honest, upright and able journal.

In this fact lies the reason of its perpetuity while so many speculating mining and stock journals have fallen by the wayside. It has never lent its columns to the advancement of schemes calculated to harm the public, and has kept free from all stock-gambling transactions of every kind. It is devoted to the interests of legitimate mining in all its branches, and the advancement of manufactures and mechanical industry among us.

The PACIFIC RURAL PRESS was established by Dewey & Co. in 1871, and, being candidly and reliably edited, at once took rank as a first-class agricultural journal. Conducted in an able manner by men well versed in the various branches, it has become an authority in all matters pertaining to agriculture on this coast, and has maintained its high standing.

Fraternal Journals.

But, while the establishment of the MINING

AND SCIENTIFIC PRESS and of the PACIFIC RURAL PRESS and their advancement to their present position have been accomplished, this work by no means represents all that has been done as publishers by the firm. A specialty has been made of fraternal publications. The *Golden Gate Sentinel* was purchased, and the PACIFIC STATES WATCHMAN established in its stead, this journal being devoted exclusively to the interests of the Ancient Order of United Workmen—an Order which has grown at a very remarkable rate, on this coast particularly. The State of New York alone exceeds in number the Workmen in California. The WATCHMAN is the official organ of the Order, having been officially indorsed by the Grand Lodge, and has done much to enhance and popularize the fraternity.

The FRATERNAL RECORD is another journal devoted, as its name indicates, to the interests of fraternal organizations. Some twelve of the best Orders are represented in its columns, and it has, like the WATCHMAN, certain features also which make it a favorite home paper. The firm has founded, and now publishes in addition to these fraternal papers, others of similar style, devoted to the interests of particular Orders.

The LADIES' HOME JOURNAL is devoted, as its name indicates, to the instruction, entertainment and advancement of women. Literature, art and fashion are represented in its columns. Other journals have been established and then merged into the present publications, and have helped strengthen and widen the circulation of the same.

A Thoroughly Established Firm.

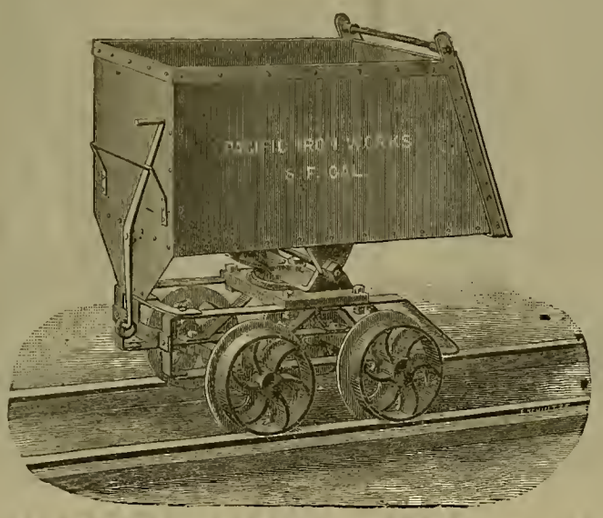
The twenty years' experience has benefited the patrons of Dewey & Co. as well as the firm itself. It has now in its employment men specially fitted to take charge of its various departments and attend to its details, a number of whom have been with it for many years.

This is but a brief glance backward we have given. It would be difficult in a short space to recall the vicissitudes of so many years, or many details, important in themselves at the time, but merged now into the finished whole. The firm of Dewey & Co. may congratulate itself on having placed itself in the front rank with those established among the progressive people on this coast. The 20th anniversary of the firm was celebrated on the 1st inst., by a holiday given to the employees by the proprietors, and a social reunion and presentation in the evening, fuller reference to which is made in another column.

By the co-operation of the best talent procurable on the different departments and the dovetailing of one part to another, a strong, united feeling has existed, which has been of great value to the establishment. No firm could have succeeded so well in this business unless it had the facilities alluded to. The patent publishing, engraving, advertising, and other departments have helped each other in such a manner as to make a strong whole.

All of the present publications of the firm are illustrated. Indeed, Dewey & Co. have made a specialty of illustrated periodicals, and have made thousands of engravings since their establishment in business.

Though in the earlier days of the existence of the firm a struggle was necessary to establish the journals on a firm foundation, of late years the reputation for energy, perseverance and honesty which it has attained has been of much benefit to it, that more recent attempts at enlargement have prospered well. The firm has long been established on a sound financial basis and its success has been continuous.



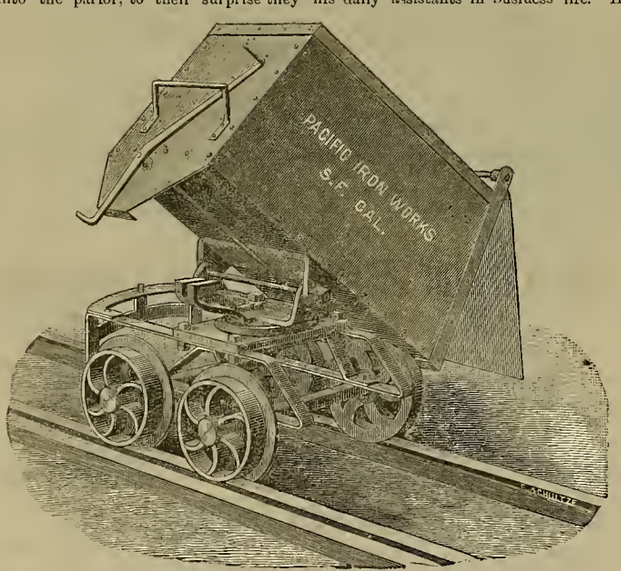
The editors assume responsibility for the statements in the sketch, it having been prepared without asking the consent of the publishers.

UTILIZING SUBTERRANEAN HEAT. — Many methods have been proposed for utilizing the internal heat of the earth, and if we remember that the temperature increases at an average rate of about 1 deg. F. for each 50 feet of increasing depth, it will be readily seen that such utilization is quite possible. It is probable, however, that the excavation of wells deep enough to boil water and produce steam, would involve a greater cost than the production of steam by the combustion of coal or by solar heat. The Japanese are seriously considering the utilization of the hot springs near Tokio, as a means of producing heat and power. The subject has been discussed in the Japanese Seismologic Society. In a country where the presence of hot springs and the frequency of earthquakes indicate a rapid increase of subterranean temperature, the thing may be quite practicable. It has even been questioned whether the extraction of the heat would not diminish in some degree the frequency and intensity of earthquakes.—*Soc. des Ing. Civ.*

A Pleasant Reunion.

It is not often that the attention of our readers is called to matters personal to the proprietors or editors, but in this instance it may be considered excusable, since the occasion for it is one that may interest them. The first day of the month marked an era in the existence of the firm of Dewey & Co., publishers of this journal. It was the 20th anniversary of the formation of the firm. The employees received a holiday with the compliments of the firm, and returned a vote of thanks for the courtesy.

Some of the oldest of the employees had arranged a quiet little programme for a celebration of their own, aside from the holiday portion, not desiring to see the gifts all on one side. The one who had been longest with the firm—some 13 years—had invited the married ones to dine at his residence in the afternoon; and had arranged for the principal employees to come there later in the evening.



STANDARD FORM OF ORE CAR.

After dinner, when the ladies and gentlemen came into the parlor, to their surprise they found a number of acquaintances awaiting there ready to offer congratulations. Mr. E. J. Wickson, Editor of the PACIFIC RURAL PRESS, on behalf of his brother employees, made a few remarks on the history of the firm and the occasion of the gathering, concluding by presenting a silver tea service to each of the members of the firm as a mark of esteem from the employees. With each present was a copy of the following, signed by the employees, one being addressed to W. B. Ewer and the other to A. T. Dewey:

SAN FRANCISCO, Dec. 1, 1883.

Dear Sir:—We wish you to accept from us, on the occasion of the twentieth anniversary of the firm of Dewey & Co., a slight testimonial which may in future remind you, not only of your past and present employees, but also of our good wishes for the continued prosperity of the individuals and the firm. All of us have been for years in the employment of the firm, and hope that its progressive advance will be uninterrupted; its business continue to widen and increase; that its present members will many years conduct its fortunes; and that the name of Dewey & Co. will long be a familiar one, the length and breadth of the Pacific coast, the welfare of which it has done so much to foster.

Mr. W. B. Ewer responded to the sentiments expressed, in a happy manner, though somewhat "taken aback" with surprise. He reviewed the early difficulties the firm had labored under, and spoke of its present position, sketching briefly some of the events in its history, and thanking his friends for their interest in its fortunes. Mr. A. T. Dewey also thanked those present for their unsolicited good wishes and kindly feelings towards himself and partner. He spoke feelingly of the relation of employer and employed, and hoped that these friendly relations now existing would always be maintained. He spoke also of the progress of the firm since its inception, and of the genuine pleasure it gave him to see himself surrounded on that social occasion with so many who were his daily assistants in business life. He felt proud to think they had met to do himself and partner the honor they had, and was grateful for the kindly sentiments expressed. He expressed thanks for the handsome memento he had received, and would treasure it far beyond its intrinsic value. He felt confident that although this was the 20th anniversary of the firm, it was now but fairly started in its progress, and that much of its work was yet to come. Its present position gave it the advantage for still more earnest work, which he felt satisfied could, in the light of past experience, be readily carried out. He felt that the firm had laid the corner-stone and foundation of an improved system of journalism that will rank hereafter higher in the estimation of intelligent and progressive communities. It had been their desire as publishers to meet the higher wants of the community, in affording journals free from the ordinary objectionable features, and pure in tone and subject.

ORE CAR DISCHARGING LOAD.

Mr. J. C. Hoag, on being called upon, in a happy vein told those present of the estimation of the firm in the business world, and extended some complimentary remarks to its members. Mr. George H. Strong, manager of the Patent Department, and Mr. W. B. Turner, editor of the PACIFIC STATES WATCHMAN, also made a few pleasant remarks. The host of the evening expressed the pleasure of himself and wife in seeing so many associates assembled socially around the hearthstone, and congratulated the members of the firm of Dewey & Co. on reaching so advanced an anniversary. Refreshments were partaken of by those present, and the evening passed pleasantly in social converse. Reminiscences were indulged in, and the cares of business and every-day life banished for the time. The employees succeeded perfectly in their endeavor to surprise Messrs. Dewey and Ewer, neither of whom had the slightest intimation of the presentations. The presence of the ladies lent an added charm to the pleasures of the evening.

A souvenir of the anniversary, presented by the hostess during the evening, consisted of a cabinet-size photograph, with reduced facsimiles of the "headings" of the various newspapers and periodicals which had been established or published by the firm of Dewey & Co. These are so arranged as to surround portraits of A. T. Dewey and W. B. Ewer, and a panel suitably inscribed. Above is a representation of a printing press, and on each side are scrolls with the figures "1863" and "1883." The card forms a very neat and appropriate souvenir of the occasion.

Standard Ore Cars.

The above cuts represent the Standard end and side dumping ore cars, size of body, 32x24x30 inches; capacity, about 1,200 pounds; gauge of track 18 inches to 20 inches, as may be desired. It is very strong, made entirely of iron, the body being of ¼-inch boiler plate, well banded and joined with angle iron. The running gear is of wrought iron, securely braced and riveted together with chilled "cap" wheels. These wheels are made in such a manner that they cover the journal of the axle entirely, preventing under wear by keeping out sand and grit, a matter of much importance. The car is well made, properly balanced, light running and easily handled. It is made in this city, by Rankin, Brayton & Co., Pacific Iron Works, and is a very superior ore car. A large number of this type are in use.

DEATH OF REV. S. S. HARMON.—In the death of the Rev. S. S. Harmon, of the Harmon Seminary, of Oakland, the educational interests of this State suffer a severe loss. For many years an instructor, his ripe experience and judgment was of great value in many ways. Rev. Mr. Harmon was well known throughout the State for his clerical and educational work. He was born in Richland, N. Y., May 24, 1818. He graduated with honors at Union College in 1843, and in the following year married Miss Frances Walsworth, with whose assistance he conducted an academy in Orange county, until he was admitted to the Presbyterian ministry in 1850. In 1853 Mr. and Mrs. Harmon came to California and labored in church and school in Sonora, Tuolumne county, for ten years. In 1863 they moved to Oakland, and conducted the Female College of the Pacific, and in 1868 they opened a college at Santa Barbara, and experienced several successful and prosperous years. In 1872 they accepted the charge of Washington College, then new, and opened it as a mixed school, with a full complement of pupils. At the end of ten years' labor in Washington College, Mr. and Mrs. Harmon perceived an opening in Berkeley for a select school for young ladies, and they opened the Harmon Seminary at that place. This institution has become popular and successful, and will be continued in the spirit of its founder by Mrs. Harmon and her children.

WORK on the bridge for the Oregon Short Line, at the mouth of Burnt River across Snake River, is progressing rapidly. The other bridges across Snake River are nearly completed. The upper bridge, near the mouth of the Boise, will be finished in ten days. The Oregon Railway and Navigation Company is crowding vigorously railroad work between Baker City and the town of Huntington. Nearly all the earthwork will be completed this winter, and the road be ready for iron early next spring.

THE Secretary of the Treasury has sent word to N. W. Spaulding, Assistant Treasurer at Francisco, to have $50,000 in ten cent pieces coined at San Francisco, so as to satisfy the demand for subsidiary silver there. He also informed Spaulding that he would send him $20,000 in five cent nickels.

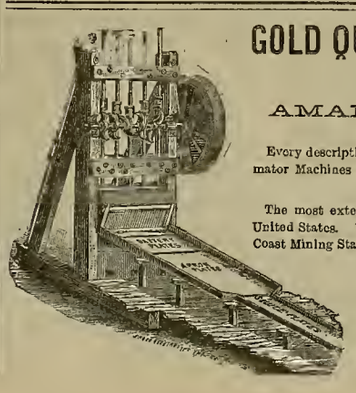
CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of these mills on the Whidden mine, in El Dorado County, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop-stamp mill:



1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it, and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

GOLD QUARTZ and PLACER MINERS'

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

Every description of plates for Quartz Mills and Wet or Dry Placer A malgamator Machines made to order, corrugated or plain.

3,713—LABEL.—N. W. Griswold, Alameda, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

METALLIC FENCE-POST.—David B. Scott, Shingle Springs, El Dorado Co., Cal. No. 289,149. Dated Nov. 27, 1883. As a substitute for wooden fence-posts, it is claimed by many that the angle-iron fence-post comes nearest the requirements of strength, durability and economy. These posts are usually tapered at their lower end and driven into the ground. They will not, however, hold in hard or soft soils against the upward strain of the wires when drawn to a proper tension to fasten them; and this is the case especially where the face of the country is rolling, hilly, or cut up by deep ravines which have to be crossed. In such ground, if driven when the earth is dry, they hold for a time; but when it becomes soft in wet weather, the strain of the wires, which did not move when placed, will have a tendency to draw them from the ground, as their shape and smooth surface is not such as to resist the lifting force. This is more especially the case on the Pacific Coast, where the ground is baked by the summer heat and softened by the winter rains. The object of this invention is to provide means for resisting or counteracting the upward strain of the wires at all times, in any soil. Mr. Scott provides an improved screw-point and anchor-bars to keep the posts in position.

SEWER-GATES.—Samuel Johnson, S. F. No. 289,107. Dated November 27, 1883. This is a gate which is designed for temporarily checking the flow of water in sewers; and it consists of two sections overlapping each other at or near the center, and with a means for adjusting so that their edges will fit the walls of the sewer. A rod or bar having its outer ends threaded with right and left screws, respectively extends across the back of the gate, and large nuts fit the screws upon its opposite ends. The outer faces of the nuts are beveled so that when forced outward by turning the screws, they will bind against the walls of the sewer and hold the gate firmly in place.

MACHINE FOR SHELLING PEASE.—Alfred Swiugle, S. F. No. 288,743. Dated Nov. 20, 1883. This machine for shelling pease consists in a combination of a horizontal, perforated traveling belt, having projecting teeth, with another horizontal toothed belt, means for moving the latter above the former in the same direction and at a higher rate of speed, and means for imparting a transverse vibratory motion.

If you want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. Co., for "Lubrice." It is the best compound grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils

SEWER GAS TRAP.—The Garland sewer gas trap has been placed in the Lick House, Mr. William Sherman, of the Lick Trustees, being convinced of its efficacy. This is a California invention which has been very successful in its results, having been widely introduced within the past few years. Many large hotels and public buildings, as well as private families, have adopted it.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Mining Share Market.

The stock market seems to be demoralized. Indeed the brokers are evidently turning their attention to other things than mining stock, and going to deal in grain more than formerly. Of course a good strike in the Comstock mines would no doubt start up a small boom again; but it is hardly probable that the mining share market will ever be of the importance it formerly was. The Ophir Company are extracting about 500 tons of ore per week from their 150 level, which ore is being sent to mills on the Carson river for reduction. It is nearly all fillings of very low grade. At the middle mines prospecting is pretty much at a stand. In the Chollar and Potosi no attempt has been made to prospect in a long time. At the Savage they tried it for a time on the 2700 level, but found themselves headed off in every direction by water, so were obliged to return to the main incline and put in the time at sinking that until the new hydraulic pump shall make it safe for them to crosscut in the wet ground above. At Gold Hill the Yellow Jacket, Crown Point and Belcher companies are taking out all the ore the mills on the Carson river can reduce with the present stage of water. The Alta folks have drained their mine nearly to the 2150 level.

New Ore Mill.

Mr. John J. Newsom, the architect of this city, has just obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency, for an attrition mill, or apparatus for grinding quartz, etc. The die has a cup-shaped depression, into which ore may be received. Ribs are formed around the interior of this die, so that when it is filled with rock the latter will be prevented from slipping within the die, and will partake of its motion. The die is fixed to a suitable plate or disk secured to the upper end of a vertical spindle or shaft, which is revolved by any convenient power. The vertical adjustment of this spindle is effected by a wedge, which may be moved beneath the spindle-step by a screw. The disk has a flange or rim around its circumference considerably larger than the die.

Above the die is a hollow cylindrical shoe, also provided with ribs on its interior, or made of a polygonal shape. This shoe is secured within a hand, the whole being fixed to and supported by a stationary framework. A hopper is placed above it. Around the disk and hand, with their shoe and die, is fixed a case of sheet metal, or other suitable material, this case being closely covered above, and having a central aperture, through which the vertical shaft passes, and a flange around this aperture extends up near to the bottom of the disk, so as to prevent the escape of dust. Around this flange and between it and the outer wall is an inclined channel or flow, which receives the pulverized material after it escapes over the rim of the disk and conducts it to the point of discharge. Cleats or lugs are fixed around the interior of the case to receive and support the amalgamated copper plate, against which the finely pulverized pulp will be thrown by the action of the rotating disk.

The operation of this machine of Mr. Newsom's is as follows: Ore or rock in sufficiently small fragments is placed in the hopper and fills the hole, the hollow cylindrical shoe and the revolving die. The ribs in the interior of the die cause the fragments of rock contained in it to revolve with the die, while the ribs in the shoe above hold the rock within it nearly or quite stationary. The die is set with its periphery sufficiently near to that of the shoe, by means of the wedge-key in the step, and the space between the die and shoe thus formed serves for the escape of the pulverized material as fast as it is formed. The dust escapes when ground fine enough, and passes into the space between the rim, from which it eventually escapes over the top into exterior casing and passes down the chute to the escape. The disk and rim are made heavy enough to act as a fly-wheel and keep up the motion under the irregular strain of the work.

Bullion Shipments.

WHAT'S the use having dyspepsia? Why beleh and say you've got heartburn every time you eat? Be sensible; take Brown's Iron Bitters and be cured.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Nevada.
I. M. LEHJY—San Bernardino and San Diego counties.
J. J. BARTELL—Santa Clara county.
C. E. CURTIS—Kern and Fresno counties.
A. S. DENNIS—San Mateo county.
A. C. KNOX—Colusa, Tehama and Yolo counties.
A. J. DUDGEON—Mendocino and Humboldt counties.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

IDAHO MARBLE.—Mr. R. F. Beale showed us yesterday a specimen of Idaho marble taken from an extensive quarry in Cassia County, near the line of the old stage road, where the same crosses the summit of the Goose Creek Mountains. Mr. Beale, whose long experience in working marble makes him a competent judge in such matters, assures us that this marble is equal, if not superior, to any other yet found on the American Continent. It has a firm, fine texture, and is susceptible of the finest polish. The quarry has been found to extend over an area on the mountain side of one mile in width by four in length. The marble is found in slabs of any required size and of varying widths, from three-fourths of an inch to several feet, and these slabs are found deposited upon another like the leaves of a book, and inclined towards the summit of the mountain at an angle of forty-five degrees. The quarry is easy of access and easily worked; situated within thirty miles of the railroad by the usual route traveled, which crosses Snake River at or near the mouth of Goose Creek. Mr. Beale will have a lot of the marble brought here soon, which he will work into specimens of his handicraft, showing the superior value of the material.—*Idaho Statesman.*

POWDERED ASBESTOS.—M. Erichsen, of Copenhagen, uses powdered asbestos for making a special enamel or coating. The powder is mixed with soluble salts, such as silicate of potash, and mineral or other colors, which combine with the silicic acid, so as to form a product which resists the action of oxygen, heat, cold and moisture. This furnishes a refractory glazing, which protects porous materials, and which can be applied to wood, to gas or water pipes, to brick walls, to constructions of stone or cement, etc., etc. It has been proposed to use it in boilers, to protect the plates against the too great intensity of the fire. When applied to masonry or to wooden objects, the surface is first washed with water and soap. In the preparation of the coating it is only necessary to use the refuse of the asbestos, which would be worthless for any other purpose.—*Chron. Industr.*, Jan. 21, 1883.

New Life

is given by using BROWN'S IRON BITTERS. In the Winter it strengthens and warms the system; in the Spring it enriches the blood and conquers disease; in the Summer it gives tone to the nerves and digestive organs; in the Fall it enables the system to stand the shock of sudden changes.

In no way can disease be so surely prevented as by keeping the system in perfect condition. BROWN'S IRON BITTERS ensures perfect health through the changing seasons, it disarms the danger from impure water and miasmatic air, and it prevents Consumption, Kidney and Liver Disease, &c.

H. S. Berlin, Esq., of the well-known firm of H. S. Berlin & Co., Attorneys, Le Droit Building, Washington, D. C., writes, Dec. 5th, 1881:

> *Gentlemen:* I take pleasure in stating that I have used Brown's Iron Bitters for malaria and nervous troubles, caused by overwork, with excellent results.

Beware of imitations. Ask for BROWN'S IRON BITTERS, and *insist* on having it. Don't be imposed on with something recommended as "*just as good.*" The genuine is made only by the Brown Chemical Co. Baltimore, Md.

Standard Consolidated Mining Company.

San Francisco, December 1, 1883.

At a meeting of the Board of Directors of the above named company held this day, an extra dividend (No. 62) of twenty-five cents (25c.) per share was declared, payable on WEDNESDAY, December 12, 1883, at the office in this city, or at the Farmers' Loan and Trust Company in New York.

WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco.

NOTICE OF ASSESSMENT.

The Land Purchasers' Association.—Location of principal place of business, San Francisco, Cal. NOTICE IS HEREBY GIVEN, that at a meeting of the Board of Directors, or Trustees, held on the 5th day December, 1883, an assessment of five dollars ($5.00) per share (being balance of 44th and part of 45th installments) was levied upon the capital stock of this corporation, payable immediately to the Secretary at the office of the Company, 318 Montgomery St., San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 7th day of January, 1884, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 12th day of February, 1884, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

EDWARD P. GRAY, Secretary.

OFFICE—318 Montgomery St., San Francisco, Cal.

N. B.—This Assessment is to pay the taxes on the property of the Association for the current year.

ASSESSMENT NOTICE.

Gould and Curry Silver Mining Company.

ASSESSMENT No. 46.

Levied	November 7, 1883
Delinquent	December 12, 1883
Day of sale	January 3, 1884
Amount	Fifty cents per share.

ALFRED K. DURBROW, Secretary.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Swedeu, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, Now Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Pateuts are obtainable.

No models are required in European countries, hut the drawings aud specificatious should be prepared with thoroughness, by able persons who are familiar with the roquiremeuts and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaiuiug foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other respousible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portiou of the patent business of this coast has been done, and is still heiug done, through our agency. We are familiar witb, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here thau any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inveutors of the Pacific Coast thau to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, aud applicants for patents can rest assured that thoir communications and business transactious will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventious already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professioual men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustratious of iuveutions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

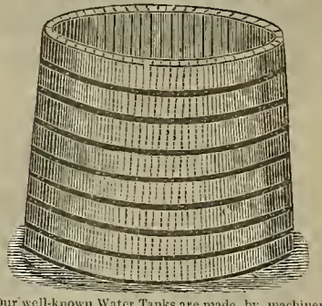
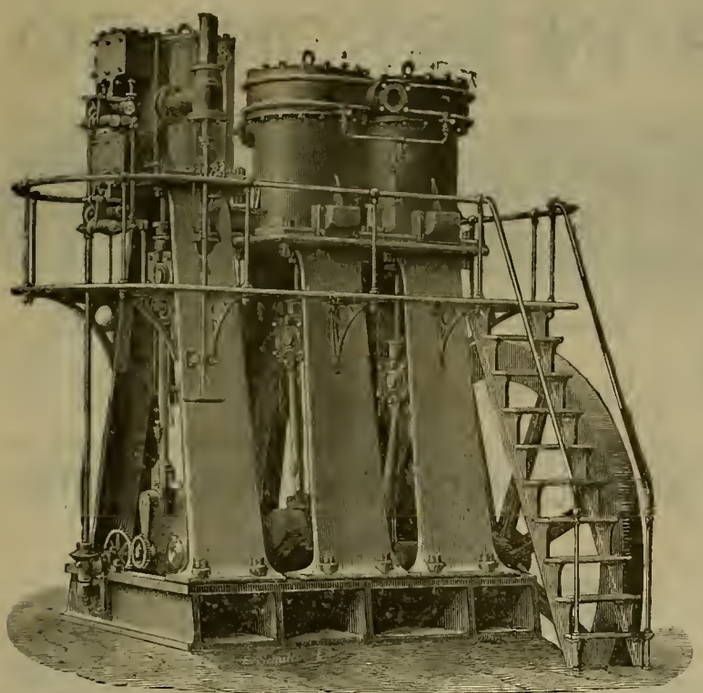
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.



THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.



It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.

While thi power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. ☞SEND FOR CIRCULAR. Address

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

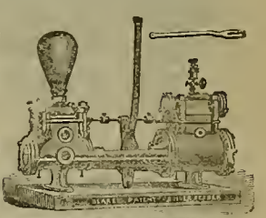
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.



The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

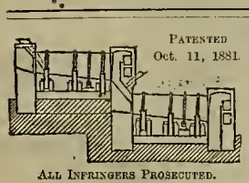
HYDRAULIC GRAVEL ELEVATORS.

The Great Problem of Shallow Hydraulic Mining Solved.

NEW FIELDS OF ENTERPRISE IN HYDRAULIC MINING OPENED UP.

These machines are thoroughly effective for working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.



No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon.

At the property of the Yreka Creek Gold Mining Company, in Siskiyon county, Cal., an Elevator of the Improved Form has been introduced, which, with a head or pressure of water of 266 feet, is elevating through an 18-inch machine to a vertical hight of 46 feet from bedrock to upper flume.

☞ Descriptive Catalogues and prices furnished on application to the undersigned, who are the sole manufacturers of these machines.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

The Bower-Barff Process—No. 2.

There was commenced a series of experiments with carbonic acid chemically produced by the decomposition of chalk, the idea being that three equivalents of iron would unite with four of carbonic acid, forming one equivalent of magnetic oxide and four of carbonic oxide, if the heat were sufficiently high. The coating was very light in color, pleasing to the eye, but easily removed. This coating, from effects exactly similar and designedly produced by a studied manipulation in the furnaces in successful operation in England, France and here, proves pretty conclusively that carbonic acid, practically pure, produces upon iron, at an elevated temperature, a film which is, in composition, nearer the metallic state than is magnetic oxide. But even supposing that the results obtained by the carbonic acid had been successful as then carried out, the objections referred to concerning the air process would still exist, as external heat and a closed iron muffle would always be necessary. I therefore proposed to use a fuel-gas producer, similar in principle to the Siemens generator, but altered practically to suit other requirements, to burn the combustible gases thus produced with a slight excess of air over and above that actually required for perfect combustion, and to heat and oxidize the iron articles, placed in a suitable brick chamber, by these products of combustion. I also arranged a continuous regenerator of fire-clay tubes underneath the furnace, so that the products of combustion leaving the oxidizing chamber passed outside the tubes, imparting a portion of the waste heat to them, which was taken up by the ingoing cold air passing through their interior on its way to the combustion chamber. I had hoped in this way to be able to so regulate the excess of air over that required for complete combustion as to be able to produce magnetic oxide directly, instead of the lower and useless oxide or combination of oxides produced by carbonic acid alone. I obtained some beautiful results, and some again were unaccountably bad, and I soon found that it was as difficult to regulate the precise amount of oxidation as it first was in the Bessemer process, and I was fortunate enough to hit upon an almost parallel remedy—that is to say, I increased the quantity of free oxygen mixed with the products of combustion, and oxidized the iron articles to excess during a fixed period of generally 40 minutes, when magnetic oxide was formed close to the iron and sesquioxide over all. Then for twenty minutes I closed the air inlet entirely leaving the gas-valve open, and so reduced the outside coating of sesquioxide to magnetic oxide by the reducing action of the combustible gases alone.

The excess of oxygen in the first instance produces sesquioxide of iron, and the under surface of this, being in contact with metallic iron, undergoes reduction to magnetic oxide in the following manner: Four equivalents of sesquioxide unite with one of metallic iron, forming three equivalents of magnetic oxide, or, symbolically (3) $4Fe_2O_3 + Fe = 3Fe_3O_4$. When deoxidizing by combustible gases, consisting mainly of carbonic oxide, three equivalents of sesquioxide unite with one of carbonic oxide and form two equivalents of magnetic oxide and one of carbonic acid, or symbolically (4) $3Fe_2O_3 + CO = 2Fe_3O_4 + CO_2$. Another method of reduction is by carbon itself, when the formula stands thus: (5) $3Fc_2O_3 + C = 2Fe_3O_4 + CO$.

Formula (4) is also the reaction when rusty iron is reduced by producer gases, which consist largely of carbonic oxide, and by the specimens exhibited it will be seen that articles completely pitted with rust may have their surfaces rendered rustless. In this case the periods of oxidizing and deoxidizing are reversed—that is to say, the latter occupies forty and the former twenty minutes. No oxidizing is theoretically necessary, but practically a certain amount is requisite to keep up the heat in the chamber, which of course could not be done unless combustion took place some time or other.

It will be as well, before I make any comparison between Professor Barff's process and the processes patented by my father and myself, to state that the whole of the Professor's patents, wherever existing, have been purchased by my father, so that in this case, at least, I hope you will not say that "comparisons are odious." Professor Barff's process is better than ours for wrought iron, and perhaps for polished work of all kinds, as iron commences to decompose steam at a very low temperature; in fact, much below visible redness. Only the other day at the annual meeting of the Association of American Stove Manufacturers, held in New York, I was asked whether stove patterns might not be made of cast iron, polished and then oxidized. Here is one among many instances where the steam process is almost invaluable. For ordinary cast iron, and especially that quality which contains much carbon, the Barff process is much too slow in its action, and some specimens that I have treated in England have taken as much as thirty-six hours to coat effectually, which could readily have been finished off in five hours by the Bower process.

The main distinction between the two is that the Bower is much more energetic in its action than the Barff process. The carbon in cast iron impedes oxidation, and so, while cast iron is far more readily treated in the Bower furnace, wrought iron is apt to scale unless it is rusted beforehand. The rust then eats into the metallic surface under the influence of heat, and forms a tenacious combination with it. The objection to the use of a closed muffle externally heated, as in the Barff process, has been almost entirely overcome by simply putting wrought iron into a Bower furnace, previously well heated, then shutting off both the gas and air supplies, and admitting steam into the regenerator tubes. The steam thus passes through the red-hot tubes, then through the combination chamber and its contingent passages, already highly heated, over the articles in the oxidizing chamber, heating and oxidizing them, and thence over the outside of the regenerator tubes, depositing a great portion of its heat there before passing to the chimney, and which is again picked up by the ingoing fresh, cooler steam. In this way the heat in the chamber is highest shortly after the commencement of the operation, and gets gradually lower during the time of exposure, which varies according to the class of goods, from five to ten hours. At the close of the operation, just before the articles are taken out, everything is moderately cool, and this for steam is the perfection of action, as stated by Professor Barff himself. Steel, I consider, can be equally well treated by both processes, and, indeed, it is natural to expect this, steel being, so far as the quantity of carbon it contains is concerned, between cast and wrought iron. Polished steel, however, is better treated in a low-temperature Barff furnace.

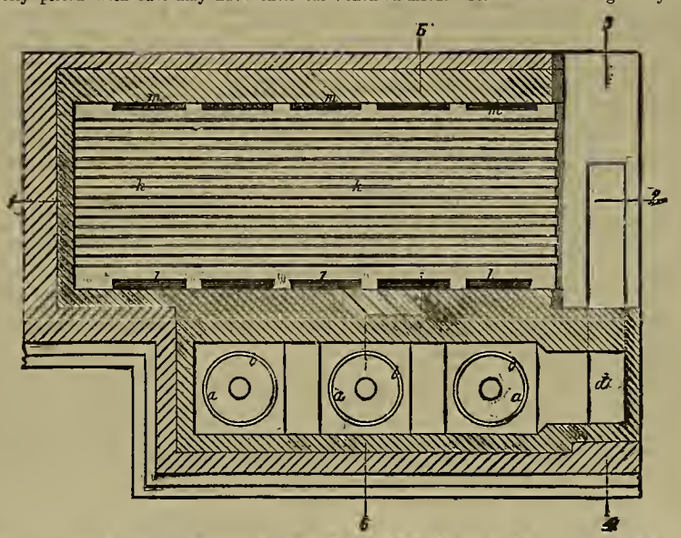

Fig. 3.—HORIZONTAL SECTION, BOWER-BARFF FURNACE, ALONG LINE 7.

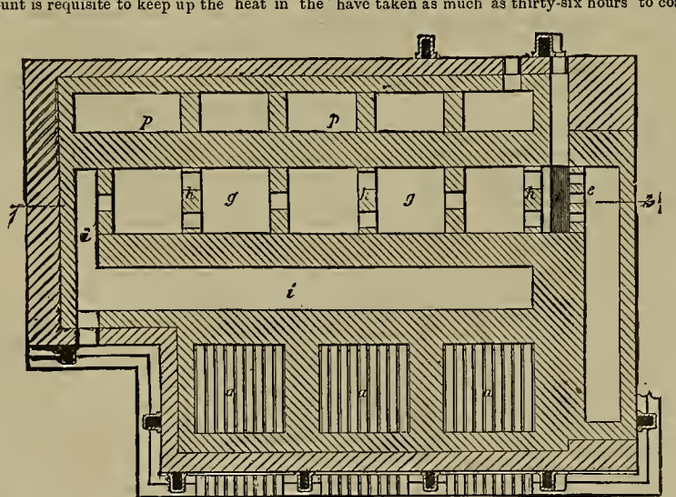

Fig. 4.—HORIZONTAL SECTION, BOWER-BARFF FURNACE, ALONG LINE 9-10.

With regard to the quality of fuel burned in the gas producers, a non-coking gas coal is the best, and Virginia splint has suited very well in this country, and of this about 1 ton every three days is required for a furnace with an oxidizing chamber 13 feet long, 4 feet 3 inches wide and 4 feet 3 inches high. When a gas coal is employed, it should be fed through the charging hoppers just before each deoxidizing operation, when a smoky flame is of great advantage. I have, however, discovered that anthracite can be used as well as a gas coal by simply allowing petroleum to drop at the rate of one gallon per hour upon the red hot surface of the coal in one of the gas producers.

The engravings on this page show two more views of the furnace in addition to those we gave last week. The figures—3 and 4—are horizontal sections taken along the lines 7-8 and 9-10, of the engraving shown last week. The same description applies, viz: The hopper supplies the producers for gasifying the fuel. The carbonic oxide from the combustion of fuel in the producers, passes along a conduit d (its flow being controlled by a slide c), to the openings e, where this combustible gas meets a current of hot air ascending through a passage f, and is consumed. The products of combustion are thence conducted along a passage g, where they are thoroughly mixed by open brick-work cross walls h, and then return along a passage i, whence they enter, through the oblong holes l, the chamber k, in which the articles to be coated are arranged. After having passed over and among the articles to be coated, the waste escapes downward through ports m, into regenerator chambers p, and thence to the chimney flue, heating in its passage the tubes t, composing the regenerator.

The coal fields bordering on the Teanaway, says the Kittitas, W. T., *Localizer*, bid fair to develop into something valuable. The coal is said to be a very superior quality of bituminous, and is of a shining jet color, and makes an excellent flame. Its proximity to the Northern Pacific railroad survey adds value to the find, either for the company or for shipment.

CORRESPONDENCE.

The After-Glow.

The Phenomenon in the Western Heavens.

EDITORS PRESS:—Many of the newspapers of this coast have recently referred to an unusual phenomenon noticeable in the western heavens for an hour or an hour and a half after sunset—luminousness often extending to the zenith and lighting up the whole sky, particularly to the south and southeast. The greatest brilliancy is always a little to the south of west, within twenty degrees of the horizon. It often appears like the reflection of a great conflagration at a distance, and frequently exhibits every shade of yellow, from a light straw color to burnished gold. The writer first noticed this after-glow some time in the latter part of September or first of October, when it was quite faint in the west near the horizon, but it has been gradually growing brighter, and continues longer than at first.

During the fall months and latter part of summer the atmosphere was quite hazy, as in Indian-summer weather, and it seemed when the brightness alluded to began to be observable that this peculiar, smoky condition was in some way related to it. But now, it appears, such is not the case. The haziness was most noticeable at the time, and before the first appearance of this luminous reflection in the west, and during the last two weeks has almost entirely disappeared; whereas, the after-glow has been growing brighter.

This Strange Phenomenon,

Which has been remarked from southern Arizona as far north as Oregon, and eastward to Nevada and western Texas, is ascribed to various causes—increased density of the atmosphere, the effect of heavy sand storms, etc. But as it has been observed in the Hawaiian Islands, by crews of vessels in the Pacific, at a great distance from land, and even in Europe, —it is not probable that it can be attributed to local causes. If it were due to a greater humidity it would not continue so long at this season of the year, when the temperature is subject to sudden and great changes; nor is it likely that it would reach the great height above the earth's surface that this ethereal substance evidently does, as is clearly proven after sunset by the appearance of a bright reddish or yellowish light far above the uppermost stratum of clouds. It is impossible that sand storms, which are infrequent, circumscribed in extent, and never of long duration, should exert a like influence, and for so long a time. It is nothing of an ordinary nature that produces this brilliancy, for it matters not whether the evening be warm or cold, or whether the sky be perfectly clear or partially flecked with clouds, the after-glow is visible at the usual time.

In the humble opinion of the writer the most plausible theory yet advanced regarding this peculiar phenomenon is that it is caused by a

Finely Divided Volcanic Dust,

Or gaseous vapor from the great eruption in Java, which broke out August 26th. It might be objected in the first place that the air currents would not transport this material to so great a distance; but several instances have been cited of volcanic dust, ejected by lesser eruptions than that of August last, being carried thousands of miles. Prof. Judd, in his excellent work on "Volcanoes" (page 72), says: "It is not an unusual circumstance for vessels at sea to encounter at great distances from land falling showers of volcanic dust. We sometimes meet with this far-traveled volcanic dust under very unexpected circumstances. Thus, in the spring of 1875 I had occasion to visit Prof. Von Rath, of Bonn, who showed me a quantity of fine volcanic dust which had during the past winter fallen in considerable quantities in certain parts of Norway. This dust, upon microscopic examination, proved to be so similar to what was known to be frequently ejected from the Icelandic volcanoes that a strong presumption was raised that volcanic outbursts had been going on in that island. On returning to England I found that the first steamer of the season had arrived at Leith from Iceland, bringing the intelligence that very violent eruptions had taken place during the preceding month."

The master of the bark *John M. Clerk*, which arrived at Honolulu in November, 1880, from Hongkong, reported that on the 10th of October the decks of the vessel were covered with ashes from a volcano on one of the southern islands of Japan. A phial of these "ashes" shown to the writer resembled the substance erroneously termed "black sand," which underlies the surface soil of Oahu, and probably other islands of the Hawaiian group.

Mr. S. E. Bishop, of the Hawaiian Survey Department, communicates to the Honolulu *Saturday Press*, of September 22d, the following regarding the after-glow: "I first noticed

These Peculiar Appearances

On the 5th inst, at 7 P. M.—so long after sunset that ordinarily no trace of color remains on the western sky. The sky from southwest to west was then covered with a lurid red and dull yellow glow, much resembling that produced by a distant conflagration. This extended to an altitude of 15 or 20 degrees. Something of the same was also distinguishable in the eastern sky. I continued to distinguish this light until 7:25. Mr. J. F. Brown says that he observed it until 7:45. After 7:25 I was otherwise engaged.

"I would note three peculiarities of this phenomenon, distinguishing it from ordinary sunset reflections, and unlike anything I remember to have observed before. First—It appears to be a reflection from no cloud or stratum of vapor whatever. An undefinable haze might, perhaps, be fancied to be the medium reflecting sunlight. Second—The peculiar glow, as of a distant conflagration, totally unlike our common sunsets. Third—The very late hour to which the light was observable—long past the usual hour of total cessation of twilight. To these may be added a fourth peculiarity—that the center of brilliancy was more or less to the south of west."

"I am disposed to conjecture that some very light element among the vapors of the Java eruptions has continued at a very great hight in the atmosphere, and been borne by the upper currents across the Pacific into this region. The best evidence of the surmised connection with those eruptions would be the tracing of an increased appearance of these phenomena westward across the Pacific. * * * It will be interesting, also, to trace the extent of this phenomenon to the eastward. Has it been perceptible in California?"

In the same paper of October 13th, he says: "During the past two weeks the haze stratum has developed more definiteness of form. In certain conditions of sunset light it has been distinctly visible as a continuous sheet over the entire sky, at a hight far above that of the highest cirrus clouds. A slight wavy ripple has been very noticeable in its structure. It has always been perfectly transparent, transmitting the light of the smallest stars, and itself invisible, except in particular conditions of the sunlight. During several days it has formed a conspicuous circle of fifteen to twenty degrees radius against the sun, appearing as a misty rippled surface of haze with faint crimson hue, which at the edges of the circle gave a purplish tint against the blue sky.

"So the evidence favors a remote source of this vapor. It seems impossible that our own volcanoes could, unobserved, have emitted such vast quantities of pure tenuous gases, unmixed with coarser smoke. * * * The theory of a remote origin seems also to be favored by the long continuance of a very nearly uniform condition of this base stratum. A local smoke would have rapidly varied its condition. This has lasted now for four weeks, with little alteration in structure.

"It seems to answer well to the character of a tenuous, delicate residuum of volcanic smoke, completely purged of all its coarser elements by a kind of levigation in its course through the upper atmosphere across the Pacific. It is most significant that it was first observed nine days after the Java eruptions. * * * Captain Penhallou, of the *Hope*, definitely observed these same phenomena in latitude 24° 06" N., and longitude 140° 29" W., on September 18th, midway between this and the American coast."

Thus it appears that these phenomenal

Reflections of the Solar Light

Were first noticed in the islands nine days after the breaking out of the eruption in Java, and several days before they became visible in California, which would be the case if the above theory of the origin of this vapor or other subtile material be the correct one. The greatest brilliancy there, as here, is noticeable to the south of west, which tends to prove a remote south-westerly origin. If this matter were evenly distributed through the atmosphere, the reflection would naturally be brightest in the track of the setting sun.

Since Mr. Bishop first observed the after-glow in Honolulu the following appeared in the London *Times:*

"A greenish tint has lately been visible round the sun. Several explanations have been put forward, of which the most plausible appears to be that offered by the government astronomer, that it is due to the passage across the south of India, of clouds of sulphurous vapor from the Java volcanoes." Here is further evidence in proof of this theory. Java being in the region of the equatorial calms the lighter particles of water thrown out by the late eruption, which must have been carried many thousand feet above the earth's surface by the force of the ejectment and by the ascending current of rarefied air caused by the intense heat of the volcanic fires, must have been widely distributed over both the northern and southern hemispheres, the direction of the upper atmospheric currents between the tropics being north and south from the equator. These after-twilight reflections have been reported from Australia, and from the above paragraph quoted, it is evident that a portion of this tenuous volcanic dust or vapor has been borne westward, as well as eastward to our shores.

The "greenish tint" referred to by the *Times* has also been noticeable here; and on the evening of Nov. 30th, for the space of fifteen minutes, the entire reflection was of that same tinge, varying from a dull, murky green on the southwestern horizon to the faintest resemblance to that color beyond the zenith toward the east. This was also noticeable last evening—Dec. 5th—for about five minutes. The sky was more than half overcast with cirrus and cirrostratus clouds, but above them this greenish hue was discernible.

The Honolulu *Press* says editorially of these phenomena: "Perhaps the only really plausible theory yet offered is that of Mr. Serano Bishop * * where he seeks to connect it with the volcanic outbreak in Java. * * There is this fact, however, which seems to bear against it: That while we have had many and large eruptions on Hawaii, with immense lava flows, the reflected light from which has often been seen from Maui and Oahu in the direction of the volcano, no effect has ever been visible, so far as the writer is aware, in any way approaching the nature of the cosmic appearances lately seen."

The Hawaiian Volcanoes.

Are unlike all other large ones that have been most observed, and the character of their eruptions is different. No others discharge such great quantities of lava nor emit so intense a heat. Other volcanoes usually eject vast volumes of ashes, cinders, rock and dense clouds of smoke, whereas the only instance of any considerable shower of ashes and fragments of pumice stone from Mauna Loa was in March, 1868, when the surrounding country for many miles was covered several inches deep. During the last eruption from that mountain, which commenced November 5, 1880, the heat was so great that no heavy masses of clouds gathered on the side where there is usually the greatest precipitations, until the outbreak had spent its fury, and for two months very little rain fell at Hilo, a place proverbial for its heavy rainfall. During the months of November and December of that year the precipitation measured only 5.49 inches. During the same months in the following year it amounted to 52.18 inches.

During this eruption, which continued nine months, only once, for a period of three or four days, was there an appreciable haziness noticeable in the atmosphere at Honolulu, 180 geographical miles northwest, and to the leeward of the volcano, and this was during a cessation of the usually prevalent trade wind. Probably this haziness would have been more frequent had not the eruption quieted down during the months when southerly breezes are most common. It was noticeable also that the mineral smoke from the source of the lava flow bore a small proportion to that caused by the burning vegetation in the dense forests through which the burning river forced its way. No where else do

Lava Fountains

Play to so great a hight and in the same manner as on Mauna Loa. Elsewhere columns of volcanic debris are thrown into the air and frequently fragments are scattered for miles around. During the eruption of 1880-81, a lava fountain, variously estimated at 800 to 1,000 feet in hight, ascended from the crater at the source. Rev. Titus Coan, an unimpeachable authority, in his work, "Life in Hawaii" (p. 280), speaking of the eruption of 1852, says: "On the 20th (Feb.) the eruption broke out laterally, about 4,000 feet below the summit; * * from this aperture a brilliant column of fire shot up to a hight of 700 feet, by angular measurement, with a diameter of 100 to 300 feet. This lava fountain was sustained without intermission for twenty days and nights."

On the principle that where there is much fire there is little smoke, one would think, naturally, that there would be a limited quantity of fine volcanic particles of any description to be transported to great distances from these eruptions by the air currents; and, if any, it would be borne to the eastward of Honolulu. On careful consideration it can not be conceded that the absence of similar phenomena in Honolulu to those now visible after sunset, on the occasion of Hawaiian volcanic eruptions, "bear against" the theory of a Javan origin.

Usually, the Volcanic Cloud

Is most dense over the lava flows during Hawaiian eruptions when, as previously stated, the liquid fusion has reached the forests, and also when the lava stream pours into the sea immense clouds of steam then mingling with the smoke of the burning vegetation. But that other substances than smoke and steam are contained in the clouds rising from the crater and lava streams and fill the air for a great distance on the leeward side is proved by the deadly gases impregnating the atmosphere, to breathe which is certain death.

The edge of the lava stream, however, may be approached on the windward side with safety. The following excerpts from Coan's "Life in Hawaii" (p. 284), will show that the amount of debris usually thrown off during eruptions in that island is small when compared with large volcanoes elsewhere, although the lava discharge is greater. Speaking of his approach to the source crater of the eruption of 1852, in which a lava fountain was playing, he says: "The heat was so intense that I could not approach the pillar within forty or fifty yards, even on the windward side. * * * On the leeward side the steam, the hot cinders, ashes and burning pumice forbade approach within a mile or more."

The eruption from Mauna Loa in 1868 was an exceptional one in many particulars, and the atmosphere about the group for a few days was very hazy, probably too much so to admit of any such display as that now visible. In the appendix to Jarves' "History of the Hawaiian Islands" (p. 235), occurs the following paragraph in the account of this eruption:

"The quantity of lava thrown out has not probably been one-tenth what was discharged in 1859, but the quantity of steam, gas and smoke emitted during one week, must have exceeded what escaped during ten weeks in 1859, when the volume of smoke was comparatively small. We judge so from its density over all the group, and for a thousand miles off. This has not occurred in any late previous eruption to the same extent. The inference, therefore, may be drawn that when an unusual quantity of smoke escapes, a less amount of lava will be discharged; and *vice versa* when the the quantity of smoke is small, the amount of lava is increased." This agrees with the statement before made, that the quantity of other material than molten lava commonly emitted during the Hawaiian eruptions is comparatively insignificant. It must be remembered also that the

Late Eruption in Java

Was the severest ever chronicled, and that the vast quantity of matter ejected is without precedent. The only one approaching it in severity was the disastrous eruption of 1772 in the same island. Speaking of this outbreak, Judd, in his book on "Volcanoes" (page 169), says: "This is perhaps the most violent and terrible that has happened within the historical period. A lofty volcanic cone, called Papandayang, 9,000 feet high, burst into eruption, and in a single night 30,000,000,000 cubic feet of materials were thrown into the atmosphere, falling upon the country around the mountain, where no less than forty villages were buried. After the eruption the volcano was found to have been reduced in hight from 9,000 to 5,000 feet, and to present a vast crater in its midst, which had been formed by the ejection of the enormous mass of materials."

Another account of this eruption says that "in a single night such an immense quantity of scoria and ashes was thrown out that an area having a radius of seven miles was covered with a layer fifty feet thick."

The Javan eruptions have always been noted for discharging vast quantities of material. "In October, 1822," says one account, "at midday, under a cloudless sky, without any premonitory warning, a dark, dense mass suddenly rose from the mountain of Galunggong, a short distance east of Papandayang, and spread itself out with such appalling rapidity that in a few moments the whole landscape was shrouded in the darkness of night." In 1843 Mt. Guntuo, in the same island, flung forth ashes, cinders, etc., to the extent of 20,000,000 tons. Older records, although there is no means of verifying them, being traditional only, tell of other disastrous volcanic outbursts, accompanied by severe earthquake shocks.

For accounts of the late eruption we have, as yet, to depend on the telegraphic dispatches to the newspapers; but they are sufficient to enable us to form an idea of its severity, although they may not be correct in every particular. From these the following are condensed:

"The Outburst

Took place on the 26th of August, accompanied by shocks of earthquakes and tidal waves. The sides of the great volcano Krakatoa were blown out into the sea, and the whole island on which it was situated entirely disappeared. Stones and volcanic matter were hurled a distance of two and three hundred miles. The captain of a steamer in the straits of Lunda reports that ashes fell on the decks of his vessel to the depth of eighteen inches, and that he passed masses of floating pumice stone seven feet deep. The next day sixteen active volcanoes rose out of the sea between the site of the island of Krakatoa and Sihisie Island, and almost directly over the site of Mersk and Middle islands, which had disappeared beneath the waves. An extensive plain of volcanic stone was formed in the sea near Sampong, Sumatra. Much of the low land along the coast was swept by tidal waves, and smaller islands were totally or partially inundated.

On the 27th the craters of Papandayang began to discharge great masses of destructive matter, but without the force of the former action. Three distinct columns of flame were seen to rise from the mountain to a vast hight. Stones fell for many miles around, and the black fragmentary matter that was carried into the air caused total darkness. Suddenly the scene changed—the mountain was split into seven parts without a moment's warning, and as many peaks rose to a great hight where before Papandayang stood alone. From the fissures poured clouds of steam, and the black ejected lapilli flowed in a steady stream down the mountain-side. The exhalations of carbonic-acid gas were so abundant that fowls and animals and a few human beings were killed by it. The total loss of life during the eruption is estimated at 75,000 to 100,000 souls.

"Previous to the rending of the mountain," says one account, "the rise of vapor produced the appearance of a column several thousand feet high, based on the edge of the crater. It appeared from a distance to consist of a mass of innumerable globular clouds of extreme whiteness, resembling vast balls of cotton rolling one over the other as they ascended, impelled by the pressure of fresh supplies, urged upward by the explosions. At a great hight the column dilated horizontally and spread into dark and turbid circles. The cloud was shaped like an immense umbrella."

These quotations from the newspapers give us some idea of the force of the outburst and of the

Enormous Quantity of Material Thrown Out.

The volcanic cloud, which arose to a hight of many thousand feet, caused "total darkness," as was the case in the eruption of 1822. If the outbreak from Mauna Loa in 1868, which was

(CONCLUDED ON PAGE 382.)

MECHANICAL PROGRESS.

Grinding and Polishing Metal Surfaces by Hand.

There is no job the worker in metals is called upon to do that requires the exercise of his brain and muscle in the proper direction more than the grinding and polishing of metal surfaces on that class of work where machinery can not aid him. The more he exercises his brain, the more saving he will be both of his time and muscle. The practice generally employed by machinists in grinding and polishing either new or old work is to mix the polishing material with oil, usually refuse machinery oil; in most cases this is a great mistake, and has caused the loss of time, patience and money.

Take, for instance, the grinding to a true bearing of a stop cock, a valve seat or a slide valve. There are few machinists but what have had more or less of that class of work to do, particularly in jobbing shops, and we seldom find one who uses the same method of accomplishing the job that is practiced in shops where that class of work is made a specialty. In fitting and grinding the plug into the barrel of a cock, a little judgment and care will save a great deal of hard labor, and in no case should oil be mixed with any of the grinding material, for the following reasons: If fine emery, ground glass, or sand are used with oil, it requires but a few turns of the plug in the barrel to break up the grains of the grinding material into very fine particles; the metal surfaces also grind off, and the fine particles of metal mixing in with the grinding material and oil make a thick paste of the mass. At this stage it is impossible to grind or bring the metal surfaces to a bearing, as the gluey paste keeps the metal apart; if more grinding stuff is applied it will prevent the operator from seeing what part of the barrel and plug bears the hardest.

Again, if the grinding material be distributed over the whole surface, the parts that do not bear will grind off as fast as the parts that touch hard, as the particles work freely between the surfaces; should the barrel and plug bear equally all over when fitted, it requires more care than if it were a top or bottom bearing, as that part of the barrel and plug across the "waterway" grinds twice as fast as the other parts, therefore it should be kept the driest. Now this objection holds good in the grinding of valve seats or slide valves, to wit: the separation of the surfaces of the metal by a thick, pasty grinding material. In order to bring the surfaces to a perfect bearing rapidly and with little labor, the following directions will be found worth a trial:

To grind a stop cock of any kind, first see that the plug fits the barrel before it is taken from the lathe. Run a half-round smooth file up and down the barrel, to break any rings that may be in it; a few rubs of a smooth file back and forth over the plug will break any rings or tool marks on it. Wipe both parts clean. Use for grinding material fine molders' sand, sifted through a fine sieve. Mix with water in a cup, and apply a small quantity to the parts that bear the hardest. Turn rapidly, pressing gently every few turns; if the work is large and the lathe is used, run slowly; press, and pull back rapidly to prevent sticking or ringing; apply grinding sand and water until a bearing shows on another part; then use no more new sand, but spread the old that has worked out over the whole surface. Turn rapidly, pressing gently while turning; withdraw the plug and wipe part of the dirt off, and rub on the place a little brown soap; moisten with water, and press the surfaces together with all the force at hand, turning at the same time. Remove the plug and wipe both parts clean; next try the condition of the bearing by pressing the dry surfaces together with great force. If the parts have been kept closely together while grinding, and the plug has not rubbed against the lower part of the barrel, the surfaces will be found bright all over and a perfect bearing obtained. If an iron barrel and a brass plug are used, or two kinds of brass, a hard and soft metal, soap should be used freely in finishing up, as the tendency to form rings is greater when two different metals are used.

In grinding a slide valve which has been in use until hollow places have worn in the surface, emery mixed with water, or sand and water, will be found better than oil, unless a light body of oil, such as kerosene, is used. If water is used with the grinding material, soap should be rubbed on hollow places, and the grinding stuff should be applied to the high parts in small quantities, keeping the low parts clean and dry until an even surface is obtained all over; then the worn-out stuff should be used for finishing up. In polishing metal, oil that will "gum up" should not be used with the polishing material unless for a dead-fine polish. In polishing old brass work which has been scratched and tarnished by wear, pumice stone or bath-brick should be used with soap and water for scouring off with, and rotten-stone with kerosene oil for the wet finish, and dry for the final polish.' The same method should be used for new brass work.

New work should require, after leaving the lathe and vice tools, but little polishing or grinding, and every good workman should try to avoid using an emery stick or emery cloth, as with proper care in the use of tools a great deal of grinding and polishing can be dispensed with.—*American Machinist.*

STARTING FIRES.—Edwards, in his "Catechism of the Marine Engine," gives the following as the best way to start fires: Before proceeding to start the fire, you must see that the man and the hand hole plates are put on (if they have been taken off for cleaning out or repairs) and the joints properly made. If the boiler is new, or in good order, a gum gasket is all that is required to make them tight, but if the boiler is old and worn about the handholes, it will be necessary to put two or three turns of lamp wick around the gasket, smearing it with white lead. After the plates are all on, fill your boiler with water until the glass gauge is half full, then cover your grate bars all over with coal, and put in two or three layers of cordwood (pine is the best). Then take some shavings, split-wood, or oily waste, place it over and about the wood next to the door, and light it, keeping the furnace door open and the ash-pan door shut (if there be one) until the wood is thoroughly ignited, and then, and not until then, shut the furnace door (and open the ash-pan door if there be one) and cover the wood with coal, adding to it as fast as the wood burns away; in a short time you will have a splendid fire. Steam can be raised a half hour sooner in this way than by the common method of putting the wood on the bare grate-bars.

STRAINS ON IRON AND STEEL.—The various tests which have been made with a view to determine, if possible, the effect of percussion on iron and steel, show some interesting results. In some recent experiments of this kind in England, square pieces of iron and steel boiler plates were used for the purpose, the former being seven-sixteenths of an inch thick, and the latter three-eighths, a charge of one and one-half pounds of gun-cotton being used in each experiment. The plates were laid over, respectively, a basin-like cavity in the top of a large block of iron, and the gun-cotton was exploded over the center, at a hight of about nine inches. The outcome of these experiments proved that the mild steel plates of the Siemens and Bessemer processes, tempered in oil, possess an endurance and ductility far beyond what have been known to characterize British wrought irons, and that steel possesses certain positive advantages over iron, in the manufacture of boilers, locomotive tires or rails.

TIGHTENING PULLEYS.—The tightening pulley is applied to belts for increasing their adhesion to the pulleys; and as this is liable to fail first on the smaller pulley, it is usual to place them on the slack side of the belt, nearer this pulley, in order to increase adhesion as well as the area of contact, which it effectually does in this position; but it also increases the friction of driving, in proportion to the thrusting of the same from the line of its natural curvature. If placed nearest the larger pulley, it would increase the adhesion where such is not wanted, and would, at the same time, diminish the area of contact on the smaller pulley by pulling the belt away from it, thus lessening the very effect which it was applied to remedy. It would, however, increase adhesion by augmenting the tension of the belt; but this in turn would add to the resistance to be overcome, by creating additional friction in the shaft bearings.—*Cooper on Belting.*

STICKING A KNIFE THROUGH A BOILER.—A feature of the recent inquest concerning the "Riverdale" steamboat explosion, which would be amusing if there was not a tragic side to the matter, was the testimony of the first engineer, that on looking over the boiler, a small quantity of salt on the covering revealed the presence of a leak; and that after cutting through the lagging he found the shell so corroded by salt that he could thrust his knife through the iron. This corrosion was of such a character that it was bounded sharply by iron of substantially the original thickness. This shows that those classes of feltings which cannot be readily removed for the external inspection of the shell are dangerous, because they do not at once and readily show the presence of such leaks and corrosions.—*Journal of R. W. Appliances.*

A GRINDING MACHINE for producing the relief on twist and fluted drills has been invented by Henry F. Wheeler, Leominster, Mass. The cross-pin of the reciprocating rod travels in a spiral groove in the rotating sleeve, and in a straight groove in the spindle which carries the drill, and this gives the spindle and drill a rotation independent of the sleeve, which causes them to turn at a different speed from that of the sleeve, whereby the proper relation between the part of the drill in contact with the grinder and the part of the cam in contact with the friction-roller is produced.

A HINT TO MANUFACTURERS.—The *Northern Tier*, Crookston, Minn., says: "One of the impositions which farmers are subjected to by manufacturers, is putting up their machines, plows, etc., with round bolts having round heads. Often in plows of noted patterns the bolts are round with round heads, fitting a counter-sunk hole, and the only way to tighten them is to cut the nuts off with a cold chisel and replace with new bolts. Many wagons and machines are open to the same objection, which is certainly a very serious one and should be remedied."

SCIENTIFIC PROGRESS.

Evolution.

An eminent writer pitches into the advocates of evolution who have been making such a stir during the last few years, after the following fashion:

It is amusing, perhaps more so than folly ought to be, to see an ignoramus stand up and prate over evolution. It does not disturb him to be reminded that nature seems to have gone out of the business of evolution. That is nothing. He can trace anything backward, the horse to the time when he was five-toed, and the five-toed back to when he was web-footed, and the web-foot back to fins. But it is a sad thought that all upward progress has ceased. Evolution has ceased to evolute. Engravings of wheat and cattle and men found on the pyramids prove to us that none of these have changed. Four thousand years have gone by, and the first specimen of a better man does not appear. There is no sixth sense, or third eye, or winged shoulders, or telescopic eye—nothing to show that we are links in the progression upwards.

Nature has no longer a laboratory or a pattern shop, in which she is evolving better forms of anything. There is no such thing as a plant or a grain or a tree leaving off some of its habits and taking on new ones, so as to become a different order of things. Strawberries are not approaching the size of watermelons. The fox, unmolested by traps and chains, is free to develop into something better, but he does not incline. The fact is, that which was built a ferry-boat remains a ferry-boat, and what was built Great Eastern will always be Great Eastern; and it is just as true that elephants never lose their trunks, nor essay to carry more than one; the wild horse never affects a horn, nor do wild cattle abandon the fashion of two. The schools of mackerel never graduate whales. Catastrophies have occurred in which the lives of thousands of species have suddenly been arrested, and the bodies of many have been preserved in stone. The surprise never yet overtook a creature that was on its way up higher into a new and unknown species, nor do existing forms give any signs that they tend to invent new and untried organs. Neither is there any such thing conceivable that we can trace backward through the successive links of the progress of a species, without coming, at last, to the first link, which had no predecessor, and which could not have created itself. The whole system of evolution is without facts or even analogies to support it. Its wisest supporters are cautious not to make assertions. They say, May it not be so? It is reasonable to suppose, etc. All true science is based on facts; evolution is not so based, and it has no claims to be a science.

A VACUUM A GOOD CONDUCTOR.—Professor Edland has communicated an important paper to the Royal Academy of Science, Sweden, in which he adduces further proof of his discovery that a perfect vacuum is a good conductor of electricity. This result is directly opposed to the current doctrine that a vacuum is a perfect insulator. The reason why a Torricellian vacuum is not traversed by an electric current is due to the fact that there exists at the points of the electrodes an obstacle to the discharge of the current, and this obstacle is augmented as the air is rarefied. If the current could be introduced into the vacuum without electrodes, it would be able to pass through the void without difficulty. The conclusion he arrives at from his recent elaborate experiments is that the maximum attained by the current intensity at a certain pressure of the air when a current traverses a rarefied air space is not due in any way, as generally assumed, to the resistance between the electrodes by the air having its minimum at that pressure, and afterward increasing in amount with the increase of rarefaction, but to the fact that the sum of the electromotive of the spark and this resistance then possesses its minimum value. With the continuation of the rarefaction the resistance of the column of gas diminishes; but the electromotive force increases. Without employing electrodes at all, M. Edland can, by induction, easily excite luminous effects in a gas sufficiently rarefied to stop the passage of a powerful current from electrodes. But this would in his opinion be impossible if a highly rarefied gas were an insulator.

PHOTOGRAPHY OF MOVING OBJECTS.—The dry-plate process and special arrangement of the camera, by which exceedingly brief exposures are possible, have enabled the photographer to take views of rapidly moving objects. With particularly sensitive plates some startling results may be obtained, and not only can moving animals and vessels be photographed, but the spokes of the wheel and the fast trotter can be shown with sharp and distinct outlines. Even views from the windows of a quick train can be obtained. The necessary time of exposure has been reduced to such a small fraction of a second that absolute steadiness of the camera itself no longer enters into the problem. The dry plates are gradually driving out the wet ones in the galleries, and those who pose in uncomfortable positions are no longer in danger of being tired out. The artist no longer finds it essential to tell his patrons to "look pleasant," but he aims to tell them something interesting, when the natural expression comes over the face, and is instantly caught by the camera. The taking of the baby's picture is no longer accompanied by dread. Much of the best work done with the dry-plate process has been by amateurs.—*Scientific American.*

PHOTOGRAPHING THE SOLAR CORONA WITHOUT AN ECLIPSE.—Dr. Huggins has continued his experiments on this subject during the past season. He has made use of a fine seven-and-a-quarter-inch speculum by the late Mr. Lassell. Three inches and a quarter of the central portion only are employed, the light being received a little obliquely, so as to throw the image to one side, as in the Herschellian telescope, thus avoiding a second reflection. The absorbent screens of potassic permanganate, or blue pot-glass, have been dispensed with, and an emulsion, prepared specially for the purpose by Captain Abney, and containing only chloride of silver, has been generally used for the sensitive plate. Between April 2d and September 4th, fifty plates have been exposed on fifteen different days; and all of them are said to show a more or less distinct coronal appearance around the sun.

The plates have been put into the hands of Mr. Wesley, the celebrated engraver, who made the magnificent plates of Mr. Ranyard's Eclipse volume; and he has prepared for each day a drawing of what he could make out on all the plates taken on that day.

Four drawings were presented, each of them showing incontestibly details belonging to the lower portion of the corona. The paper was presented to the British association.

MAGNETIC RAILS.—A well informed trade contemporary says: "A professor of the Faculty of Sciences of Marseilles, together with two permanent way engineers of the Paris-Lyons-Mediterannee Line, has just made some curious experiments on the rails laid between Marseilles and Rognac. They have ascertained that all the rails that have been laid some time have been transformed as to their two extremities into powerful magnets, capable of attracting and holding iron kegs and even stronger articles. If the rails he raised they keep their magnetism for some time, but gradually lose it. Two poles are formed at the corresponding ends of two rails of opposite sign. The production of magnetism in the rails in use is to be explained by the friction resulting from the running of cars on the track. It is certain that the magnetism thus developed exerts a useful influence on the stability of the track, and increases the hold of the wheels on the rails." Without contesting the fact itself, which does not appear very surprising to us, we should be glad to know how far this magnetism can increase the hold of the wheels, which in a locomotive often carry four to six tons each, above all when the rails are placed end to end, and mutually destroy one another's magnetism.—*L'Electricien.*

LATEST FROM THE LICK TELESCOPE.—The trustees of the James Lick trust have received a communication from A. Clark & Sons, of Cambridgeport, inclosing an extract from the communication of Mr. Fiel, who has been molding the crown glass of the Lick telescope, in which he says: "Since the disk has been taken from the furnace, I have been obliged to put it back again after cutting out some soda. This operation has been done successfully, and I hope to take it from the furnace in fifteen days, and it will take about fifteen days to polish it, and it is probable that I shall be able to send it to you in the first days of December." The flint glass of the great achromatic objective was successfully cast a long time ago, and has been for many months in the the hands of the Clarks awaiting the receipt of the crown disk. The latter is much the most difficult to cast, anneal and polish, owing solely, it is believed, to the inexperience of the manufacturers with such great masses of glass. Never was such a casting attempted until the Lick telescope was contracted for. It was at one time supposed that the limit of achromatic objectives had been reached when the Washington telescope, twenty-six inches in diameter, was made.

NITRIFICATION IN THE SOIL.—Nitrification is dependent on the presence of oxygen, and Schlosing has shown that a diminution of the amount of oxygen present decreases the rapidity of the change. Such a diminution of the amount of oxygen in the soil is effected by the presence of organic matter, which unites with it, forming carbonic acid, and thus acts, as Deherain and Maguenne point out, to moderate the rapidity of nitrification, and so to prevent a loss of nitrates in the drainage water. The same authors explain in this way the greater richness in nitrogen of untilled land, and claim that the presence of organic matter is necessary in order that the soil shall gain nitrogen from natural sources.

SATURN.—Dr. William Meyer of Geneva gives the results of a large series of measures of Saturn and his rings. The measures agree very well with those taken in 1880. He also determined the position of the belt in the southern hemisphere of the planet. Encke's division was observed several times, and its position seemed to be nearer the exterior edge on the left than it was on the right ansa. On one occasion the ball seemed of a grayish-blue tint, while the ring was glittering white in color.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO.—Cor. *Dispatch*, Dec. 8: Since my last letter things have made little or no change, as the scarcity of water prevents the mines from making any headway. The Downs mine is worked on day shift. The Canvin mine is in operation, and getting out good rock. The Modoc mine and Jake Griesback are also getting out good ore. Gillick and Phillips have struck very rich ore about 60 ft deep on the ledge, and it continues to look richer as they sink. They have about 200 tons of the ore in the mill waiting for water to crush it.

NOTES.—*Ledger*, Dec. 8: The mining interest is depressed on account of scarcity of water. The Bunker Hill mill is idle from this cause, and but few men are employed at the mine. At the South Spring hill teams are hauling rock to the mill, a few hundred yards from the mine. The mill cannot be started until rain-fall increases the water in the Amador canal. Everything is in readiness. The first run of a few hundred tons is intended as a test to determine the yield of the rock by mill process. The Plymouth Con. company has, since the consolidation was effected, paid five successive monthly dividends of $50,000 each, aggregating $250,000 up to the 3d of October. The ore-body in the tunnel at the Doyle mine in Hunt's gulch continues to look well. At the Confidence mine, near Butte city, the 5-stamp mill was brought to a stand-still early in the week by the pinching of the ledge. Further prospecting showed the ore-body returning, and it was expected that the mill would be started again in a few days.

SUTTER CREEK.—*Sentinel*, Dec. 5: Sutter creek is reported as looking up. Recent strikes in the Con. Amador, the Iowa and the South Spring hill have had a tendency to give renewed confidence.

C. J. Pillsbury, who has been visiting at the Nevills mine, received intelligence that a mine in El Dorado county, of which he is part owner, has developed a pocket of $10,000 to $20,000.

Inyo.

CHRYSOPOLIS.—*Independent*, Dec. 8: Referring to the Maxim M. & M. Co. that is preparing to erect mining machinery at Maxim station 1½ miles north of Chrysopolis we stated that the rock-breaker was already in position; we now learn that we were misinformed; that the machinery is in transit from New York, and from some cause the shipment has been delayed. This company purchased the Arastra mine, situated one mile east of said station in the foothills. This mine was worked to a limited extent some 17 years since, and in later years has been scratched around the roots of the sagebrush, having been left in a very slovenly condition. The present company has already excavated and wheeled out some 500 tons of waste rock and dirt preparatory to an exploration of the mine in a systematic manner. A shaft is now being sunk on the ledge with the expectation of going down 100 ft before running a level in on the vein. This shaft is down 40 ft on a 3 ft ledge of rich ore.

THE NEW SWANSEA SMELTER.—The work is nearly completed. The finishing touches are now being put on, and the furnace will be blown about December 1st. The new furnace is first-class in every particular. The works are built about 1 mile east of the Swansea works on the toll road from Swansea to Cerro Gordo. The company mines at Cerro Gordo are being worked with very encouraging results. The Swansea company is financially sound, and the new works will start up without one dollar of indebtedness, which has not been the case with all the Inyo county mining enterprises. The starting of the new furnace on Owens lake will infuse new life into this section of Inyo.

Mariposa.

DILTZ MINE.—*Gazette*, Dec. 8: The news from this mine is that the Captain is caving down and railroading out upon the dump large quantities of ore and veins matter from the large open cut lying against the main vein to the south. The whole embankment, which is a face about fifty ft, is a remarkable formation of quartz, from 1 to 12 inches thick, covered with red dirt, ochre and decomposed matter, carrying fine and coarse gold, which is collected in the flume from the winter's wash. In consequence of the absence of a mill, the surface quartz wash, which has been going on for years, has created a vast number of tons of solid quartz suitable for milling purposes, amounting in the aggregate to 25,000 tons, from which has been taken by sluice washing and picking up free gold and nuggets, to the amount of $40,000. It is estimated that every ton of quartz that has been washed has paid $15 per ton. Captain Diltz is contemplating a ten stamp mill.

SWEETWATER MINE.—Groves Bros. reported a favorable clean up made a week or two ago. This is the first result from a two weeks' run, since the completion of the new ten stamp mill.

HO BETTY MINE.—*Herald*, Dec. 7: John Allen, of the firm of Allen & Kiefer, owners of the above named property, reports that work will be recommenced in the mine in three or four days. The shaft is now down 60 ft, and in a well-defined body of ore, which, if Mr. Allen speaks truly, will assay, at the lowest possible figure, $200 per ton. It is their intention to commence drifting from this point and to crush the rock as fast as it is taken out. Owing to lack of money, the facilities for saving the gold, which is "coated" are adequate, and the firm intend working the rock for silver alone. Mr. Allen says the rock will go two dollars gold to one of silver. Mining men will do well to visit this property and judge for themselves.

Mono.

BODIE CON.—*Free Press*, Dec. 4: During the week ending the 1st inst. there were 230 car-loads of ore hoisted from the mine. There were 120 tons of ore sent to the mill and the same amount was crushed. The average pay value of the pulp was $15.80 per ton; that of the tailings was $3.05 per ton. Yesterday's shipment of bars amounted to $6,877.83.

STANDARD CON.—There were extracted and shipped to the mill 1,419 tons of ore; received 2,346 ounces of crude bullion, and shipped to the company $16,324.50. Upraise No. 1 from south drift No. 2, 1,000 ft level, is up 148 ft; progress 8 ft. The vein is 5 ft wide, and looks well.

BODIE TUNNEL.—The south drift 300 ft level has advanced 12 ft. The north drift, 300 ft level, has advanced 9 ft, and the north drift on the 200 ft level has advanced 12 ft during the past week.

BULWER CON.—The north drift, 700 ft level, has been run during the week 19 ft; total length 469 ft.

SYNDICATE.—The mill is running steadily, with good results, upon ore from their own mine. The outlook is favorable for a good yield of bullion continuously.

A NEW DISCOVERY.—*Free Press*, Dec. 9: It is reported that a valuable quartz discovery has been made between Bodie and Sweetwater, the ore being altogether different from that found in Patterson district. The samples exhibited yesterday by one of the discoverers look more like crystallized silica than anything else, but they were full of glistening gold to the extent of $2 000 or $3,000 per ton. From what the *Free Press* reporter could learn, the new find is a continuation of the mineral belt which is now attracting considerable attention in Silver Glance district, which is really a part of Patterson, though their geological characteristics are totally different.

MAY LUNDY.—Homer *Index*, Dec. 8: Considerable activity still prevails in and about the May Lundy mine, and a respectable force is engaged in extracting ore, notwithstanding the recent heavy draft. The mill is running full capacity with over 700 tons of ore in the yard. The snow-storm of Monday caused a temporary suspension of hauling, but the road has been reopened and hauling resumed. Nothing has been heard from the parties negotiating the sale of the mine since they sailed for Europe the second time, but no doubt is entertained but the transfer of the property will take place before the end of the present month.

Nevada.

LITTLE BONANZA CLAIM.—Grass Valley *Union*, Dec. 9: Nicholls and Russell are pushing the drain tunnel on their mining claim near the head of Squirrel creek, known as the Little Bonanza, from the rich specimens of coarse gold and quartz that have been taken out of it. An open cut 300 ft long has been made together with 100 ft of tunnel, leaving 400 ft of tunnel to be completed before reaching the shaft where the pay was so good. Night and day shifts are working and making 12 ft of drift in 24 hours. The tunnel is timbered and boxes laid as the work progresses. The full length of the tunnel will be completed by February, if no hard rock is encountered. The tunnel will drain the ground to the depth of 50 ft, and it is intended to pipe all the ground above. The ground already prospected by the shaft is rich.

IDAHO.—Grass Valley *Union*, Dec. 5: On Monday the Idaho Mining Co. declared a regular monthly dividend of $4 per share, amounting to $12,400. This is an increase of $2 per share over the November dividend. The mine is looking and yielding well.

NOTES.—The sinking of the shaft of the Magenta mine has been commenced at the depth of 365 ft. The rock coming out is of excellent quality. A new level will be opened at 400 ft. Quartz is being taken out on both the 200 and 300 levels.

In sinking the shaft of the Empire mine below the 1400 level the rock is showing very well; as good as at any point above, it is said.

WORKING TAILINGS.—Tri-weekly *Herald*, Dec. 8: Justin Michell has lately worked a quantity of tailings from the Charonnat quartz mill at Canada Hill, and the result obtained has been most satisfactory. Notwithstanding the appliances for saving gold at the above named mill are most complete, Mr. Michell, by his pan process, realized $2.50 per ton from the tailings which are thrown away. The gold obtained is in very fine particles, so light as to be floated away with the sand that is washed from the mill. Mr. Michell proposes to put in a couple or more pans below the Charonnat mill and work the tailings himself, if the company do not see fit to do so themselves.

Placer.

FOREST HILL.—*Argus*, Dec. 6: The Washington Mining Association, whose mine and works are close to Forest Hill, have sunk their shaft to a depth of more than 150 ft, and owing to the presence of water are about to put up machinery that will drain the mine. The Mayflower mine is being worked by Supt. Chappellet with good prospects. The hoisting works over the shaft are substantial and quite a town is being built up around the mine. Breece & Wheeler are said to be striking it richer and richer in their Rough Gold Tunnel. At present only 3 men can work in the drift.

Plumas

THE DIADEM MINE.—Quincy *National*, Dec. 8: From J. A. Edman, who was in town on Wednesday, we learn that everything is progressing satisfactorily at Eagle Gulch. The lower tunnel is in about 320 ft, and taps the vein to the depth of 300 ft. A cross-cut has been run from the tunnel to the foot-wall, fourteen feet, but no cutting has been made the other way. It is supposed that the vein or ledge is some sixty feet between walls at this point. Mr. Edman brought some fine specimens of the rock from this tunnel, which is now being stacked in the dump for milling. It prospects about $40 per ton. The tunnel will have to go some 500 ft to be directly under the rich chimney on the other side of the hill, and the rock showing as it does now, proves that the pay-chimney is of vast extent. A short time since, in the upper level, one man in two days took out over $1,500.

GOOD QUARTZ.—From a gentleman who was in Indian Valley last week, we learn that the work in the Lucky S. mine in Emerald district, is proving it to be better than was expected. The vein has increased in width as depth has been gained, and the horn shows the rock to be very rich. The indications are strong that the property will take a leading place in the quartz mines of the county before another year.

MORE ROOM FOR PROSPECTORS.—Same of 1st: The Halstead mine, of Rich Gulch, has been traveled over daily for 30 years, and hardly a man ever dreamed of the immense body of rich ore directly under his feet. The Four Hills mine, which in a month or two yielded more than $100,000, was crossed by a trail which has been traveled every summer since the country was inhabited by the white man, and at one time a shaft was sunk within a few inches of the edge of the rich deposit. The rich rock in the Edman mine came up almost to the grass roots, and a hundred others might be cited to prove that there are just as good chances to-day in Plumas as in the new El Dorados which lure the miner away thousands of miles.

EDMAN & CO.—We have it on good authority that Edman & Marmlund have struck rich rock in their lower tunnel, and expect from the indications to find still better in a short time. They have a wonderful mine.

Three buckets of gravel in the Loring & Leavitt mine, on Thursday evening, yielded $150, or such is the report. We should call that Thanksgiving gravel.

CAVE CITY.—Cor. of Greenville *Bulletin*, Dec. 5: There is plenty of rich mining ground in the county, but scarcity of wood and water are great drawbacks, though in early days a great deal of gravel and hydraulic mining were done. Quartz mining is yet in its infancy, but what has been done is very encouraging of future results. Cave City once contained 1,000 inhabitants, but in the failure of the gravel mines the population diminished as in other mining towns, till at present the city consists of a hotel, a saloon and a haystack. A few of the curiosities of early times still remain to the place. One of these is the graveyard on the hillside. It contains sixteen graves, fifteen of them filled by men who died with their boots on, between '50 and '56.

BALD MOUNTAIN EXTENSION.—*Tribune*, Dec. 8: The total clean-up of the Bald Mountain Extension Sunday, for the past week's run, was 173 ounces, from 844 car-loads, averaging over $3.81 per car-load. One nugget weighed ten ounces, and others three, five and seven ounces.

RUBY.—The Ruby gravel mine can now be classed among the bullion producers. Thirty-two ounces of gold were cleaned up there week before last, and last week's washing yielded 56 ounces, including a handsome nugget weighing 28 ounces. Two breasts are opened out at present. Three new gangways have been started and as soon as these are opened out and water comes the present working force will be increased; 10 car-loads of gravel taken out of a 3 ft shaft in the main tunnel this week yielded $64. The main tunnel is being driven steadily ahead.

POKER FLAT.—There is considerable excitement at Poker Flat on account of quartz. Lindsay and Sutherland have located the ledge formerly known as the Marchini property on the south side of Canyon creek. Two tons of the rock were sent below, the returns from which were $15 per ton in gold. The ledge is 7 ft wide and has been prospected in 10 or more places with satisfactory results. It is a north and south ledge, and gold can often be seen in the rock.

San Bernardino.

KING MINE.—Cor. Calico *Print*, Dec. 8: Yours of the 3rd just received, and at your request, give you the following facts in relation to the King mine. The mine has been worked by the Oro Grande M. Co. for one year and has reached a depth of 450 ft, showing that the mines do go down. We have transported to the mill by teams a distance of 36 miles, 400 tons of ore, the average assay value of which has been $81.50. Had there been railroad transportation more than twice this tonnage could have been moved. The mill started on the 1st day of March, and has run 9 months, less the ordinary stoppage, from March 1st to June 15th, to present time, with 4 pans and 2 settlers, and in that time has produced $300,000 in bullion. The mine has paid all expenses, paid back to the company all money advanced for developments, and has paid in dividends $75,000. It is estimated that there is ore enough above the 6th level to keep the mill running for at least 2 years.

Sierra.

COLUMBO.—*Tribune*, Dec. 6: The Columbo mine was purchased several months ago by P. Deidesheimer, who represents an Eastern company possessed of abundant means. The claim is located west of the world-renowned Sierra Buttes mine. From an adit level which has cut the vein some 225 ft below the surface a very rich class of ore is exposed, showing free gold in abundance, and giving highly satisfactory results in the hand mortar. The vein is one of the best defined in the Sierra City district. Its average width is 3½ ft, with a general course of east and west. The vein is being energetically opened up. Stopes are being opened out from the upper tunnel and a raise has been put through to the surface for ventilating purposes. Another working adit, that will tap the ledge 450 ft below the surface, has already been driven in 400 ft. A connection has been made between the upper and lower tunnels. At the mill, work has been pushed along with vim in the past few weeks. The structure is under cover and the 20-stamp batteries, engine and boiler placed in position. It is expected to have the mill completed and running by the 20th instant. There can be no doubt that the mine is one of immense value, and that it will shortly be quoted as one of the "big things" of California.

RAINBOW.—W. H. Weldon is negotiating for the purchase of the Rainbow hoisting and pumping works, together with the shaft and right of way in the upper tunnel. Our readers will recollect that the gentleman had located a quartz ledge adjoining the Rainbow claim. His object in making the above purchase is to develop his ledge through the Rainbow workings.

SOUTH FORK.—The South Fork mine, at Forest city, continues to yield handsome returns to its leasers, the Bald Mountain Extension Co. From 427 car-loads of gravel washed last Wednesday, 90½ ounces of gold were cleaned up. The pump at the Pliocene shaft was started up one week ago.

Siskiyou.

ORO FINO.—Cor. Yreka *Union*, Dec. 5: The Eastlick Bros. are taking out their old flume, and will put a new one in its place. They intend putting on a night shift and run the work night and day, in order to be ready for water when it comes. Campbell & Co. have their ditches all cleaned out, and all necessary arrangements made for a large head of water. They have also finished their new flume, and have two large giants in position to make havoc with the western slope of the Oro Fino mountain. If fortune should favor them with a good water season there is no doubt but $40,000 or $50,000 of the hidden treasure will be jingling in $20 pieces before the close of 1884. Messrs. Thos. Mahanly and Orker Alford are taking out some very rich rock from the old Pinkham ledge. This ledge is situated about 1 mile northeast of the ledge owned by the Allen Bros.

Toulumne.

GREAT SIERRA TUNNEL.—Sonora *Democrat*, Dec. 8: The tunnel of the Great Sierra Co., Tioga, is now in over 1,400 ft, and is being pushed ahead as rapidly as possible. Several small seams of galena have been cut so far. The galena in those seams is so impregnated with arsenic that the air in the tunnel is dense with the fumes.

A CUSTOM MILL.—Some San Francisco parties are gathering information with a view to erecting a custom quartz mill here. If the inducements are sufficient the mill will be erected without delay.

NOTES.—Sonora *Democrat*, Dec. 1: The mill at the Lamphier mine started up Thursday. The Sweepstake rotary mill has been completed at the Stockton mine, and will be started up in a few days. The new mill at the Rising Sun mine is about completed, and will be started up as soon as water can be had. It is said to be one of the most complete mills in the county.

NEVADA.

Washoe District.

COMBINATION SHAFT.—*Enterprise*, Dec. 8: The new hydraulic pump is now on the ground, and portions of it (the connections at the 2400 level) have been put in place. As the pump was set up in San Francisco and tested under a greater pressure than it will be required to bear no trouble is anticipated.

CROWN POINT.—About the usual quantity of ore is being extracted and shipped to the mills on the river. Some work is being done in the way of exploring for new deposits of ore at various points. Owing to the hard freezing at nights in the mountains, the water in the Carson river has of late been falling, and the mills are not able to run to their full capacity.

UNION CON.—The south drift on the 3100 level is out over 70 ft. The face is still in vein porphyry and other vein material of no value. The drift coming north on this level is being pushed along at the rate of over 40 feet per week.

IMPERIAL.—The west drift from the 600 station is being pushed as rapidly as possible for the works in the old upper level. It is out over 200 ft.

SIERRA NEVADA.—The upraise from the north main drift on the 2900 level is progressing at the rate of 15 ft per week. The ground works well and continues dry. On the 3100 level are chambering out to the east of the joint Union Con. winze. Good ore is encountered in this chamber.

ALTA.—The water is out nearly down to the 2150 level, but progress is slow, as they are drawing from the drifts. The drifts to be drained measure about 3000 ft.

YELLOW JACKET.—About 120 tons of ore per day are being extracted and sent to the mills, and a good deal of work in the way of exploration is being done at various points.

UTAH.—The replanking of the upraise from the 1350 level has been completed, and a drift is now being run north from the 1750 station.

BEST AND BELCHER.—The joint Gould and Curry winze is being sunk and timbered at the rate of about 15 ft per week. The bottom is in soft, swelling ground, with some increase in the flow of water.

GOULD AND CURRY.—The joint Best and Belcher winze that is being sunk below the 2500 level is now down nearly 100 ft.

BELCHER.—As much ore is being extracted from the old upper levels as the mills on the Carson river are able to reduce. Some work in the way of exploring for new deposits of ore is being done.

CALIFORNIA.—The usual progress is being made in the work of sinking and timbering the joint Con. Virginia winze below the 2700 level.

SCORPION.—The face of the west drift on the 500 level is in vein porphyry that shows frequent streaks of porphyry and seams of clay.

OPHIR.—Are still extracting ore on the 150 level. The work of repairing the drift and upraise on the 1600 level is making good headway.

ANDES.—Some very fine looking quartz is being encountered in the north drift, and in the south drift is found quartz that gives fair assays.

CON. VIRGINIA.—The work of sinking the joint California winze below the 2700 level, is progressing at the rate of about 13 ft per week.

HALE AND NORCROSS.—Good progress is making in the sinking of the winze below the 2700 level, and the ground continues favorable.

OVERMAN.—On the old upper levels they are finding a small amount of low grade ore that will pay for extraction and reduction.

MEXICAN.—Good progress is being made in the work of repairing the drift and upraise on the 1600 level.

UNION SHAFT.—The work of easing timbers and repairing the 2300 station is still continued.

Belmont District.

BELMONT MINE.—*Courier*, Dec. 1: The following is the official report for Dec. 1: The stopes on the 200 ft level are looking well, the ledge is strong, and is yielding good ore. North of Canfield incline we are opening a stope on ore which assays $358 per ton. South tunnel stopes have furnished their usual amount of good ore this week. Winze from No. 1 level Laity ground is down 50 ft; ledge is 10 ft in width, and looks well. Leaching works are going slow, on account of pulp being crushed too fine. Having put on coarser screens, this difficulty will soon be overcome.

Candelaria District.

MOUNT DIABLO.—*Tyne Fissure*, Dec. 8: On the first of the month orders were received from San Francisco to discontinue shipping ore. In consequence the force at the mine has been reduced by the discharge of 25 men, and the extraction of ore stopped for the present. The remaining men have been set at work prospecting. A small streak of good ore found on the intermediate, between the first and second levels, is being drifted upon. A bullion shipment amounting to $8,803.64 was made on the 3d instant; the total shipments on November account were valued at $39,992.44.

COLUMBUS CON.—The shaft has been sunk 15 ft

during the week, making a total depth of 70 ft below the station on the 150 ft level. The south cross-cut from shaft drift No. 2 on the 150 ft level has attained a length of 15 ft. The ground is very hard, hence the slow progress in the extension of the cross-cut. The west drift from the bottom of the Bonanza winze has been extended about 5 ft, from which point a cross-cut was started and has resulted very favorably for the stockholders of the company.

ATTACHED.—Esmeralda *Herald*, Dec. 8: Suits were commenced Wednesday by the Carson & Colorado and Virginia & Truckee railroad companies against the Northern Belle Mining and Milling company. All the personal property of the defendant has been attached both in Belleville and Candelaria. The first company sues for the payment of $10,113 for wood, salt, charcoal and hauling ore, and the latter company for $1,050 for castings.

NOT SO BAD AFTER ALL.—*True Fissure*, Dec. 8: With all the uncertainty of the present appearance of mining and business matters in this vicinity, it is a good sized crumb of comfort that is left. The closing down of the Northern Belle mine, the discharge of 25 men from the Mount Diablo and the the eventual shutting down of the mills at Belleville for want of ore to crush would tend to persuade one that the bottom had dropped out of Columbus district, but it has not. The Mount Diablo is still running, though the force is reduced; the Columbus Con. has not pulled its fires, nor does it mean to do so for some time to come. But, better still, the present idle state of the Holmes and Northern Belle properties will not continue a day longer than is actually necessary. Reliable information has been received from the management of the Holmes company to the effect that operations will be resumed at an early day and on a larger scale than ever before.

Humboldt District.

WILLOW CREEK.—*Sentinel*, Dec. 5: We are indebted to W. H. Mayon, formerly an officer on the police force of Eureka, for the following letter from Willow creek, Humboldt county, Nevada. "Every opportunity confirms me in maintaining the opinion that the outlook for Willow creek cannot be excelled, if it can be equaled, anywhere. Capital is evidently being attracted to this section, as evinced by the presence of prominent experts. Willow creek lies about 50 miles due north of Winnemucca The mines are situated from 3 to 6 miles north of the Idaho road—which here passes through Quinn River valley—on the western slope of what is called the Paradise range of mountains, a range which separates Quinn river from the far-famed Paradise valley. Starting from the valley one finds in the lower foothills a mineral belt, in which lead predominates as the base. In this belt is found the Ohio mine, which has been quietly enriching its owners for years. A mile further up is a belt composed of free-milling silver ores. Another mile further up and we come to what they call here the gold belt, which also carries a large percentage of silver. Some mines on this belt are liable to change hands soon, and when they do there will be a shaking up of all the dry-boned millionaires in the land.

Paradise District.

PARADISE VALLEY MINE.—*Silver State*, Dec. 5: We learn that a lead carrying good ore, and 7 or 8 ft wide, has been cut in the Paradise Valley mine, a short distance to one side of the old drift which was run on the lowest level of the mine. As the Paradise Valley Co. own the Wild Goose as well as the Paradise Valley mine, and both are looking well, the property is considered very valuable.

The Paradise stage brought to Wells, Fargo & Co.'s office here yesterday, 2 bars of bullion valued at $4,542.18, from the Paradise Valley mine. To-day a considerable number of men are employed on property that was non-productive for years, and the mines are producing over $20,000 a month, from the ores worked in a 10-stamp mill. An impetus has been given mining in the Paradise mines, which will doubtless result in the opening up of other claims in the district.

SPRING VALLEY.—We learn from L. F. Dunn, of Vandewater, that there are 75 or 80 Chinamen at work in the Spring Valley placer mines. These mines are situated about 10 miles south of Unionville and it is estimated that they have produced over $1,000,000 worth of gold dust. White men located the mines, and then disposed of them to Chinese.

Pioche District.

DAY.—*Record*, Dec. 1: Work in the mines of this company is being steadily pushed. Ore is shipped to the furnace daily. The mines are working a larger force of men than they have for months. The furnace is being placed in the best of order at Bristol. The indications are that it will make a steady run of several months when it starts, which will be about the first of the year.

SILVER REEF.—The Christy Co., of Silver Reef, intends closing down the mines for the winter. This will make it very dull at the Reef this winter, as the Stormont is the only company now operating there.

Reveille District.

LA SALLE AND GILA.—Eureka *Sentinel*, Dec. 1: From one of the Norris brothers, who came in from Reveille district, Nye county, yesterday, we learn that there are about twenty men in the camp. Mr. Norris brought in two tons of ore from the La Salle mine that assayed $340 to the ton. He says that Gov. Adams had started to erect leaching works to reduce some 2,500 tons of tailings from the Gila mine, which will go from $30 to $60 per ton; but the work was stopped by the freezing of the mortar.

White Pine District.

SILVER CANYON.—Cor. *News*, Dec. 1: At Aurum the "Sadie L." has a very strong ledge, carrying considerable rich ore, and at the Blue Belle a regular eye-opener exceeeded my most sanguine expectations. Here they have recently developed a large body of rich ore, which has the appearance of being extensive enough to keep the mill running for a long time. The Blue Belle is a splendid looking property.

ARIZONA.

LYNX AND GROOM CREEKS.—Prescott *Courier*, Dec. 5: William Vanderbilt returned a short time ago from Lynx and Groom creeks. While on Lynx creek, he was shown through the works of the Howell Co. which are completed. They consist of a 5-stamp mill, with all appliances, including concentrators, a 30 ton smelter, roasters, etc. The entire "plant" was in operation when Mr. Vanderbilt was there. The company have abundance of ore. Crossing the divide, workers were met with in Groom Creek district, where Mr. Clark is putting up a 5-stamp battery. The mill will be supplied with 2 concentrators. The mill which is being erected to work Cherry ores will soon be pounding away. Bullion shipments are made daily from the United Verde Co.'s smelter. Company's mines in splendid condition. Activity prevails in and around the Silver Belt mine, Big Bug district. Ore still goes to Pueblo, for reduction. We heard, yesterday, that Colorado capitalists will soon start milling and mining in Placeritas and Walnut Grove districts.

NOTES.—William Vanderbilt tells us that Jack McDonald has struck it richer than ever in the Blue Dick mine. He has a good-sized ledge of high-grade ore and is taking out plenty of it. The Dosoris Co. continue to ship extra rich ore. In coming from Walnut Grove, Friday last, George T. Hogle passed by the silver mine recently discovered near the Hassayampa. He assures us that he saw silver ore and that the vein is of fair width. Work is progressing favorably in Groom Creek district. Machinery for a 10-stamp mill is being put up under direction of Philip Richardson. Two concentrating machines will make the works complete. Gilford Hathaway tells us that the Howell reduction works are under headway. He recently brought to Prescott several bars of gold and silver bullion. We have nothing new from Jerome, where the United Verde Co. are making and shipping silver and copper bullion. Gavin & Co. are sinking upon the Pine Spring mine, Turkey Creek district. The workmen are in good ore. Black Warrior and Silver Belt are looking well.

THE BONANZA FIRM IN ARIZONA.—Stockton *Independent*, Dec. 6: Tucson is in a blaze of enthusiasm over the purchase of the Ouijoto mines to-day by J. W. Mackay and J. C. Flood, the bonanza firm of San Francisco. The purchase was negotiated by W. S. Lyle, of the same place, who takes an interest with them. The price was $450,000. The mines are located 80 miles southwest of Tucson, and were discovered last May. The purchase was made on the report of J. N. Low, W. S. Patten and Hank Smith, acknowledged to be the best authorities on the coast. They report that nothing was ever discovered on the Pacific coast equal to it outside of the Comstock.

GRAND CENTRAL.—*Epitaph*, Dec. 2: The ledge is one of the best defined we have ever seen, being all the way accompanied by a clay gouge, which is one of the most characteristic features of a true fissure. Here and there a barren spot or horse occurs, followed in some places by the ledge opening into a vast chamber of high-grade ore, from which again the ledge gradually decreases to the usual uniform size. The ventilation is perfect, owing to the fact that the underground workings of this mine are connected with those of the Contention, Flora Morrison and others.

CONTENTION.—From Professor James we learn that the pumps will, without fail, start within ten days, until which time we reserve a more extended comment upon this magnificent property.

FORTUNATE.—While doing assessment work on this little fractional claim, which lies between the Empire, Tranquillity and Goodenough, a body of very high-grade ore was struck. It is being sacked for immediate shipment to the mill. This new strike demonstrates the fact that there are many ore-bodies in that vicinity which as yet have not been discovered.

COLORADO.

GRAND COUNTY.—Cor. Georgetown *Miner*, Dec. 1: John Barbee, manager of the Alice Ormond Mining Co. is pushing the work on the Ruby mine and getting out some very rich ore, principally ruby silver. This company will work all winter. Len. Pollard is also doing good work on his mine, near the Ruby. He gets out 3,000 ounce ore at a depth of 30 ft.

While talking about mines, I wish to say that there is some property in North Park that is again beginning to attract attention in the mining world. The mines are gold placers and are located on Independence mountain. The gold is the heaviest and richest in the west, bringing as high as $20 per ounce in Laramie city and other places. Independence mountain is distant from Laramie city 65 miles.

GRAND VIEW.—The Grand View mine, on Republican mountain, since our last report, shows a wonderful improvement. In the face of the main tunnel level a 4-inch streak of solid sulphuret ore was encountered Wednesday last. The mineral mills over 600 ounces silver per ton and 20 per cent copper. In the bottom of the shaft there is exposed two ft of low-grade ore, besides a streak some two inches in width of blue and green carbonate of copper with black sulphurets. This ore is high-grade also.

BISMARCK.—In sinking a winze in the Bismarck mine from level No. 2 to No. 3, Henry Bates, the lessee took out over 4 tons of rich ore in the first 8 ft. The winze is now about 16 or 18 ft deep, and Mr. Bates has a body of solid mineral 14 inches wide, which will mill over 200 ounces silver per ton.

IDAHO.

ATLANTA.—*World*, Nov. 30: The Buffalo mill has closed down for the winter. There are about 50 men in the camp variously employed. The construction of the new Tahoma mill has been suspended. The Buffalo mine will work but a few men by contract, during the winter. The Last Chance mill and mines have closed operations entirely for the winter. The Leonora mill started up Monday last on ores from the Leonora mine, which has been in operation for some time. Provisions are short at Atlanta, but the trail is still open leading in from Rocky Bar, and a heavy packing business is going on.

BANNER.—The Elmira company, at Banner, put 1,024½ tons of ore from the Banner mine through their 20-stamp mill this summer and fall; result, $107,255. The mill ran 100 days. The ledge was tapped 300 ft deep. At this depth a drift has been run on the ledge 400 ft, and the end of the pay chute has not been reached. Ten stopes have been opened. Above this drift there are about 4,000 tons, 3,000 at the very lowest estimate to be stoped. The vein averages in the lower drift at least a foot of ore, that mills over $100 per ton.

The Elmira company has paid out for labor, supplies and improvements since purchasing the Banner property in 1878, $250,000.

The *News-Miner* says Bayhorse has been one of the liveliest camps in the Territory this summer. The two smelters there have been running nearly all the time. One has shut down on account of the scarcity of coal. There are about 100 men employed in the mines at present—mostly in the Ramshorn.

IMPERIAL.—Wood River *Times*, Nov. 28: Milton E. Pinney yesterday made the final payment on the Imperial claim, up Greenhorn gulch, which he and Jabez Chase purchased a few weeks ago. The price was at the time stated at $5,000 and $3,500, but Mr. Pinney informed a *Times* reporter that the actual price paid was $2,900. Of this amount the lessees got $400, and the owners $2,500. Mr. Pinney says that he would not now sell the "prospect" for $25,000 cash. Since he got control of the property Mr. Pinney has kept about 15 men at development work, and only extracted ore enough to pay running expenses. He has shipped to Ketchum or Salt Lake, during the last 30 days, 50 tons of ore that sold for an average of $105 per ton. He has attained a depth of 150 ft, opened two levels, run two tunnels, and has ore to the greatest depth attained, and a vein 10 ft wide of second-class ore carrying a streak of solid galena which varies from 2 to 20 inches in width.

MULDOON.—John F. Boyle, of the Philadelphia M. & S. Co. got back this morning from Muldoon. He found everything in good order. About a dozen men will be kept at work in the Muldoon mine all winter, and by next spring it is expected that an enormous quantity of ore will be in sight. At the Silver Star and Salamander mines in Smoky district, a dozen men will be employed all winter to run a prospecting tunnel at great depth. At the Ketchum works two furnaces are still running full swing, and will probably not shut down until New Year's day. After that date probably only one furnace will be run.

CŒUR D'ALENE.—Bedrock *Democrat*, Nov. 29: Mr. George Ross, of this county, arrived last Tuesday from the new mines discovered in the Cœur d'Alene mountains. He reports about 900 miners in the diggings from all parts of the coast; Colorado, Utah, Arizona, California and Oregon are represented. The mines are situated 112 miles northeast of Rathdrum, on the North Pacific railroad. From that point it is 12 miles to lake Cœur d'Alene. Thence, 60 miles up the lake by steamer and from the place of landing it is 40 miles over a mountainous road. If preferred, a shorter trip can be made by land from the Rathdrum landing, but owing to the depth of the snow at the present time it is better to go up the lake by boat.

The above gives the first definite idea of the direction of the new mines from Rathdrum which we have seen.

The Palouse *Boomerang* says: Mr. Jesse Bishop, an old miner, has just returned from the new diggings. He has been there for several months and has had an ample opportunity to investigate the many reports, and from actual knowledge can give reliable information concerning the camp. He says there is no doubt but the rich ground extends over a large extent of country, the richest not yet discovered. All the creeks and side gulches give good prospects. Quartz ledges have been struck that are "lousy with gold." But little prospecting for quartz has been done owing to snow, which is 18 inches deep on the hills. The claim owners have held a meeting, and passed a law allowing claimants to be absent until the first of next June. The camp is filling up with roughs from the railroad, who express a determination to make claim jumping a specialty. They say that the 20-acre racket "must go." Mr. Bishop says it is his opinion that every claim in the camp will be jumped before spring.

The Walla Walla *Union* of Dec. 1 says: Dan Armes, of Ainsworth, of the firm of Brush & Armes, has just returned from the Cœur d'Alene mines. He reports that there are now between 700 and 1,000 men in the mines, covering about 20 miles of the "diggings." The gold is coarse and sells at $18 per ounce. Mr. Armes made his first attempt at "panning," and succeeded in abstracting about $7 in the first pan. Three young men worked a few days and as a reward for their labor they cleared about $1,000 in dust.

THE ROUTES TO THE NEW MINES.—*Oregonian*, Dec. 3: The distance from Rathdrum to the mines is nearly 100 miles, while the citizens of Herrons claim that by the trail from their town the distance is only 30 miles. Z. J. Hatch, who has just returned from the Cœur d'Alene country, has formed such a favorable opinion of the mines in that section that he and Captain Sanborn have concluded to build a small stern-wheel steamer to run between Fort Cœur d'Alene and the mission, a distance of twenty miles. They will land passengers within twenty miles of the mines, which can be reached from this point by a trail which will be made a good road in the spring.

MONTANA.

GLOSTER.—Helena *Independent*, Nov. 29: We are informed that the Gloster mine and mill will start up the 10th of next month. Work was suspended August 1st for the purpose of putting pans and settlers in the 60-stamp mill. The company will need 75 good miners. William Schollar, who has had the contract for sinking the main shaft from the 300 to the 400 ft level, has completed it, and work will be commenced at once on the vein at that depth. The west winze has been sunk to a depth of 59 ft below the 300 ft level, and at that depth the vein shows a width of 12 ft, all of it good ore.

TEN THOUSAND FOR FIFTEEN HUNDRED.—Our friend, Saly Raunheim, on Wednesday afternoon purchased of Fred Potting the Gambler claim for $1,500, and yesterday turned it over to the Montana Copper Co. for $10,000. The property is south of the Wake-up-Jim. Mr. Raunheim regards $8,500 as a fair day's wages, and says he would rather make it that way than by working on a newspaper.

ANACONDA.—Butte *Miner*, Dec. 1: A gentleman from Anaconda reports 80 men were discharged from the Anaconda works a few days ago, leaving only a corporal's guard employed about the big smelter. Some of the discharged men went to Cable, and were employed by Supt. Savery.

BONDED.—H. P. Rolfe informs us that the mining property of Holter and Hauser at Maiden—the Montana and Oro Cache mines—was bonded some time ago to an English company for $150,000, the bond to expire the 1st of January, 1884.

JIM WHITLATCH.—Jim Whitlatch, the old Montana rustler, is once more in the field, and from all indications has secured a property which will rival the Whitlatch Union in its palmiest days. Last July he bonded a group of mines for $30,000 in the immediate vicinity of the famous Cable lead, in Deer Lodge county, and which he was then satisfied was extensions of the Cable. The group consisted of the Southern Cross, Sonora, Monitor, Pleides and Monitor extension. Immediately after bonding he put a force of men to taking out ore from the Southern Cross, the most promising of the group. He has now 12,000 tons of ore on the dumps which will go from $8 to $12 per ton in free-milling gold. He is down on the lead 37 ft, and has developed it to a width of 40 ft, but as yet has found no walls. The expense of taking out the ore is only about $1.50 per ton, and the total cost of mining and milling about $4 per ton. Mr. Whitlatch yesterday completed one payment of $15,000, and in the spring will ship out a 20-stamp quartz mill from the East to erect upon his mine. He has already been offered $20,000 for his bargain, but refused. Mr. Whitlatch stated yesterday that before selling the famous Whitlatch Union he had taken from it as shown on the books $3,663,000, and he still has faith in the old mine. He believes that he can strike the lead by a perpendicular shaft of 500 ft.

NOTES.—*Inter-Mountain*, Dec. 3: The Pollock, owned by W. A. Clark and located east of the Poser, is producing 8 tons of ore daily. The last shipment of ore to the Moulton mill returned $101 per ton. The Neptune, also owned by Mr. Clark, is producing 6 tons of ore daily. It is worked in the Moulton mill and pulps an average of $76. In the Fraction, operations are confined to the extension of the 300 ft-level east from the Alice workings. The face of the drift is 130 ft from the west end line of the Alice.

NEW MEXICO.

OLD MAN.—Silver City *Enterprise*, Nov. 28: The sale of the celebrated Old Man mine has been consumated, Mr. Geo. L. Cannon was authorized to make the purchase, as we learn, by Senator Chaffee, of Colorado. The papers transferring the property have been executed. By careful investigation we ascertain that the purchase price is about $200,000. The property is to change hands on the 10th prox.

BALD MOUNTAIN.—The California group of mines in Bald Mountain, the property of Shields, Posey & Hardee, is showing up some splendid prospects. In one shaft the vein has widened to 20 inches from 4, in 10 ft, and the ore has increased in richness, running as high as $400 to the ton.

DUG-OUT CAMP.—A strike of much importance is reported at the Dug-Out camp, in the Eureka district. It is upon a claim owned by J. W. Rolland, one of the old-time prospectors of that section, and consists of a 2½ ft streak of high-grade ore. Enough work has not yet been done upon it to determine the future of the find, but it is reported as being superior to anything yet uncovered in that locality. Sample assays of the ore streak give returns averaging $300 per ton.

LITTLE BUCK.—Las Cruces *Republican*, Dec. 1: From an incline shaft down 60 ft about $20,000 worth of chloride and sulphide ores was taken, most of it from a small pocket about 20 ft below the surface. It is found in a gangue of lime spar, and although the vein is at present pinched it is easily followed. It is a contact between lime and porphyry, and the surface cropping indicate a wide distribution of rich mineral. The Little Buck is 2½ miles north of Organ and the principal work has been done at the south end of the claim. At the other end considerable bunches of the same rich ore have recently been found. Work is about to be resumed.

SILVER GEM.—A shaft has been sunk 126 ft on a 45 degree incline, and nearly a perpendicular shaft is down 76 ft. Silver is found in black sulphurets and carrying as high as 23 per cent galena. The first shipments were less than 2 ton lots and returned about $100 to the ton net. A carload lot netted $89 to the ton and the average of all shipments is $104.

UTAH.

SANTA CLARA RIVER.—Southern Utah *Times*, Dec. 1: Thirty miles west from St. George, near the Santa Clara river, a huge vein of gray carbonate has lately been discovered. At the foot of the mountain where near the surface the vein has been cut, the ore body is 15 ft wide. The gangue is of iron and the ore melts like wax, being free from refractory matter. Near the surface average assays show 20 ounces of silver to the ton and 70 per cent lead. The formation in which the vein is found is limestone. The vein has been traced by its croppings for a long distance.

VALENCIANA AND RAYAS.—In the Valenciana & Rayas mines, says Henry B. Clifford, "there are over 6,000 works aggregating fully 90 miles of drifts, stopes, tunnels and crosscuts, so gouged and cut up that the catacombs of Rome are secondary. These works extend over an area of 4,500 ft in length, by an average of 1,400 ft in depth. The average ore lodes in Rayas are 300 ft, while there is a vein width of nearly 900 ft, carrying a body of ore in places the entire distance. The intervening ground between the excavations are masses of ores, while among the refuse in the dark and gloomy corridors there are millions of cargoes of valuable mineral. Francisco Glennie, the director-in-chief of these mines, informed me that in cleaning out some passages between Mallado and Rayas, he extracted 800,000 cargoes of ore that had been left in the calls by the old Spaniards, and it is his opinion, that there are to-day full $70,000,000, not to mention the amounts in the intervening bodies."

NOTES.—Park City *Record*, Dec. 1: The stations at the 700, in No. 3 shaft, Ontario, are being cut, with the aid of the Burley's. The Creole tunnel is now in a distance of 160 ft. About 50 or 60 ft more will cut the vein. The Crescent working between the Rebellion and Climax show a large vein of ore the entire distance. An important strike was made in the Sampson this week which goes to prove that the chances for a big mine there are most excellent. The vein cut in the east drift of the 200 carries from a foot to 18 inches of ore that assays as high as 300 ounces silver and 70 per cent lead.

For Mining Shareholders' Directory, Stock Reports, etc., see page 388.

The After-Glow.

(CONTINUED FROM PAGE 378.)

of short duration, rendered the atmosphere hazy for the distance of a thousand miles, what could be expected from this greater discharge, in comparison to which Mauna Loa's emission was the effort of a pigmy. The following from Judd's "Volcanoes" will indicate the minuteness of finely-divided volcanic dust, which has on many occasions been transported thousands of miles by the atmospheric currents. "Mr. Whymper relates that, while standing on the summit of Chimborazo, he witnessed an eruption of Cotopaxi, which is distant more than fifty miles from the former mountain. The fine volanic dust fell in great quantities around him, and he estimated that no less than two millions of tons must have been ejected during this slight outburst. Professor Bonney has examined this volcanic dust from Cotopaxi, and calculates that it would take from 4,000 to 25,000 particles to make up a grain in weight." A vast amount of this dust must have escaped during the late eruption, and there is every reason to believe that a portion of it must have been borne northward and eastward across the Pacific—and in other directions also, as previously stated—and that the material now present in our atmosphere is this same volcanic dust, or lighter gaseous vapor or other rare element from the same source. If the after-glow diminishes in brilliancy or becomes invisible at Honolulu and places beyond in the South Sea groups sooner than in California, that fact will be further proof in support of this theory.

GEORGE W. STEWART.

Tulare, Decemher 6th, 1883.

Mining in Arizona

Under the vice-regal rule mining was prosecuted vigorously in Sonora and Arizona, a vast amount of treasure was taken out, and a great deal of work done. The system of mining was crude and imperfect, and the appliances for ore reduction of the most primitive kind. Water and ore was packed out of the mines on the backs of peons, and nothing but ores entirely free from base metals could be worked successfully. But so rich was the grade that under such disadvantages they were made to yield handsomely. The war for Mexican independence put a stop to nearly all mining enterprises in Sonora and Arizona, and in the latter region it never reached that degree of prosperity under Mexican control which it had attained under the government of Spain.

When that portion of the Territory south of the Gila passed into the possession of the United States, there was not a single mine worked within the limits of the Gadsden Purchase, or in all of Arizona. Want of protection from Apache depredations had caused the abandonment of every mining enterprise, and the old shafts and tunnels, and the blackened walls of haciendas and furnaces, were all there was left of once prosperous mining establishments. The first mining done by Americans in the newly acquired Territory was in the Santa Rita mountains. Hon. Chas. D. Poston, who was afterwards elected the first Delegate to Congress, organized the Sonora Mining and Exploring Company and the Arizona Mining Company, some time in 1855. These companies secured possession of many of the old mines which had been opened in early times by the Mission Fathers, and recommenced work upon them, aided by all the improved machinery and appliances then in vogue. Many difficulties had to be overcome, and many dangers to be met. The country was overrun by the murderous Apaches: machinery, tools and supplies of every kind had to be freighted overland for hundreds of miles, skilled labor was scarce, and the country was virtually isolated from civilization.

But against all these obstacles operations were pushed vigorously forward. Roads were opened, huildings erected, hoisting works put in place, mills and furnaces were constructed, and the sights and sounds of a prosperous mining industry were again seen and heard in southern Arizona. Tubac, the headquarters of the company's operations, became the most prosperous town in the Territory, and could boast a mixed population of between 400 and 500, with handsome residences, store-rooms, gardens, orchards, and many of the luxuries of civilized life. At Santa Rita, Sopori and Arivaca the reduction works were constantly at work, and a great deal of bullion was taken out. The ores were exceedingly rich and easily reduced, and, notwithstanding the constant raids of the Apaches, the work of development went steadily forward.

The breaking ont of the Civil War brought to an abrupt ending this effort to develop the mining industry of Arizona, and retarded for years the Territory's advancement. The garrisons stationed in the country were withdrawn, and the population of the country left to the mercy of the Apaches. At this time camps were established at the Patagonia, the Santa Ritas, Cerro Colorado, Sopori, and in the Cabibi district. The withdrawal of the troops was the signal for the savages to make their incursions more openly and vigorously. The marauding Mexicans from Sonora, believing that the government of the United States was broken up, crossed the border in large bands and carried off what the Apaches did not destroy. Exposed to constant attacks, surrounded by savage foes, and harassed by semi-savage outlaws, the mining camps and haciendas were abandoned. Tubac was surrounded by a horde of bloodthirsty wretches, and had not a party from Tucson come to its relief, every person within its walls would have been massacred. The Apache and the Sonorian outlaw burned, robbed and destroyed. Tubac was reduced to a mass of blackened walls, and in a few short months heaps of desolate ruins were all that was left of the prosperous mining camps of southern Arizona. Those who were fortunate to escape with their lives fled from a country which seemed accursed of heaven and a very hell upon earth.

Two years of death and desolation passed over Arizona before the mining industry was once more revived. This time it was in northern Arizona, and gold was the glittering prize that allured thousands to the banks of the Colorado. In the year 1862, placer gold in paying quantities was discovered by Pauline Weaver, in the neighborhood of La Paz, and within a year over 2,000 men were digging and delving after the yellow treasure in the mountains and dry gulches east of the Colorado. A year later a party headed by the same indomitable old pioneer discovered the diggings which bear his name in Yavapai county, and a short time after the whole coast was electrified by the wonderful discovery of Antelope Peak. This find attracted thousands of adventurers to northern Arizona, and mining received such an impetus as had never been known in the previous history of the Territory. Ledges of gold, silver and copper were discovered and located, rich placer deposits were worked successfully, quartz mills were erected, and a veritable boom appeared to have struck Yavapai and Mojave counties. The mines worked were all gold-bearing, the quartz being exceedingly rich and easily reduced.

But in the meantime the Apache was not idle. He saw his chosen domain invaded by the pale faces, and he saw the hated race receiving fresh reinforcements day after day. He saw the game ruthlessly slaughtered and his favorite mescal grounds staked off and claimed by the prospector, and he resisted the advance of *los Americanos*. By the lonely trail and the public road, behind bush, and rock, and tree, the red assassin lay in wait for his victim, and many an unsuspecting pioneer was sacrificed to his hate. Provisions and supplies of all kinds were only to be had at extravagant prices, almost everything being brought across the Colorado desert at a cost of from twenty-five to fifty cents a pound. Under such unfavorable conditions it is no wonder that mining made slow progress in Arizona. But, nevertheless, it did advance. Capital was invested, many mines were opened, and a number of mills and furnaces erected, and considerable gold found its way out of the country.

The placing of the hostile Apaches on reservations, in 1874, marks one of the brightest periods in Arizona's history. Fresh life and hope were infused into the mining industry all over the Territory; prospectors struck into the regions lately infested by the savages, and Globe and Silver King were the rewards of their toil and industry. The fame of these discoveries spread over the land; thousands of restless adventurers turned their faces southward, and millions of dollars sought investment in Arizona mines. The discovery of Tombstone, a few years later, created a grand excitement, not only on the Pacific coast, but throughout the East, and the rush to the wonderful Arizona camp has only been equalled by that to Leadville. The high grade of the ores, the vast extent of the deposits, and the small cost of reduction, caused a heavy investment of capital in the bonanza camp. The steadily increasing yield of bullion has been the marvel of the mining world; has demonstrated beyond cavil or doubt the richness of Arizona mines, and shown that her right to wear the title of queen of our mineral realm is well founded and fairly won.

The completion of the Southern Transcontinental route in 1879, and of the Atlantic and Pacific the present year, have removed the bars of isolation, and opened the Territory to immigration and capital. All portions of Arizona have felt the quickening and progressive impulses imparted by the iron rail. The country has been drawn into close communication with the great commercial arteries of the Union, and no longer is beyond the pale of modern progress. Its vast resources are becoming more thoroughly understood and appreciated, and the mining interests of the Territory have entered on a career of prosperity never before known in its annals. Capital is seeking investment, mills and furnaces are being erected, new discoveries are being made, and new camps are springing up, prospectors are swarming through mountain and plain, a steady stream of bullion is finding its way out of the country, and Arizona is pushing its way to the front place as the leading mineral region of North America. The brilliant future which many of her ardent admirers years ago prophesied seems at last about to be realized. The legends, tales and traditions of the past, about her wonderful wealth, are proved to be well founded, and some of the late discoveries would show that the half has not been told about the metallic treasures of this wonderful land.—*Hamilton's Resources of Arizona.*

THE RAILWAY SYSTEM OF INDIA includes some 8,811 miles. The gauge is three feet and six inches. All lines are built primarily for military and not commercial purposes.

GOOD rains are reported in the southern part of the State.

Recollections of California Mining Life.*

Men and Events in the Pioneer Days—No. 5.

[Prepared for the MINING AND SCIENTIFIC PRESS, by HENRY DEGROOT.]

Why the Early Pioneers Failed to Make Money.

Peter Wimmer, who was with Marshall in the mill-race when he picked up the first piece of gold, though a man of good habits, industrious, temperate and possessed of fair business capacities, never succeeded in acquiring much property, the extent of his worldly wealth consisting of a small piece of land in San Luis Obispo County, on which he and his pioneer wife are, or at least were, living not long ago. Bennett, who brought the first samples of gold to San Francisco, though far from being rich, is in comfortable circumstances, owning and living on a piece of good land in the vicinity of Santa Cruz. He left the mines in the summer of 1849, and never returned to them. Of the considerable number of white men who were at Sutter's mill when gold was discovered, none ever became rich, nor did any of them ever acquire more than a very moderate competence. Several are known to have died, if not in indigence, at least quite poor. Of the residents of the country at that time only a few afterwards became millionaires, and these were made such through the increased value of their landed possessions, or by their engaging in other than mining pursuits. The causes that brought men to California at that early day were such as little qualified them for rapidly accumulating property. The most of them came here in search of health or adventure, or in the hope of being able to live in an independent and easy-going way. Some were hunters and trappers, who, in pursuit of their vocation, having drifted into the country, remained here. Some were border men, who had sought on this far-off coast a refuge from a too rapidly advancing civilization. A few were run-away sailors or mariners, who, attracted by the beauty of the country, the excellence of the climate and the hospitality of the inhabitants, had been enticed into a long sojourn on these pleasant shores. Whatever the causes that brought or kept them here, hardly any of these pioneers had in view the acquisition of wealth; wherefore, none of them can be properly called Argonauts, using that term in its primary sense. They were for the most part a hardy, brave and generous set of men, whose habits being simple and their wants few, neither craved nor had any need for much money. The most of them left the mines early and retiring to their homes in the lower country, never troubled themselves much with gold digging thereafter.

Concerning a few of the more noted of this class something will be written a little further on; though, truth to say, it hardly needs that their names be even so much as mentioned in these fugutive papers, seeing so much that is noble and good has been recorded of them in the great work of Hubert Howe Bancroft on the Pacific States and Territories. Embalmed in the pages of the illustrious historian, their memoirs will be handed over to an honorable and an enduring fame. The Natural Wealth of California, by Titus Fey Cronise, contains also much that is interesting in regard to the lives and characters of these men, who, journeying far by land or water, came early to make for themselves homes in this border-land of the Great Pacific Sea.

The New Era.

Arriving at San Francisco in the month of February, 1849, the writer found the place crowded with miners, who, leaving the diggings at the commencement of the rainy season, had come to the city to pass the winter. A more motley crowd, or one composed of such divers nationalities was, perhaps, never before collected in one place. Almost every civilized people on the face of the earth was already represented here. The Mongolian only, of all the races now in the country, had not yet put in an appearance, the worst coming last. San Francisco, although a very Bable of languages, and the scene of indescribable activity, had up till this time remained peaceful and orderly, crimes and even misdemeanors of a grave kind having been of rare occurrence. While the merchants were busy, and the public places were thronged with frequenters and patrons, the miners, unconscious of impending events, were taking things easy. Though current wages were an ounce per day, not until they got dead broke did these old timers seem disposed to seek or accept employment. By the time spring came around the most of them had got rid of their earnings, a good share of which had passed over the gambling tables. Early in March and before more than a few of them had begun to think of returning to the mines, the advance of the new immigration had begun to arrive—an excited, eager, rushing crowd—who going for everything within reach, soon relegated to the background their predecessors in the field. To such an extent, in fact, has the year commemorated by the discovery of gold come to be overshadowed by the stirring event that followed in its wake, that the year 1849 is generally accepted as marking the advent of the new epoch in our history. Being so little in accord with the spirit of the new comers, and not over anxious to enrich themselves by gold digging, many of the forty-eighters, as already stated, left the mountains before the summer of '49 was over and returning to their homes, engaged in pursuits more congenial to their tastes and previous habits of life.

With the year 1848 all that was staid and primitive in or about the mines of California vanished. With it ended the old civilization and the old scenes, new men with new ideas and different methods of doing business having come to take the place and accelerate the work of the first stock of pioneers.

*This series of articles will be issued in a new form, with other matter, during January, 1884. Rights reserved.

Technical Training

It is not unfrequently noticed that men who pride themselves on being "practical," are the most inveterate theorists; and equally droll is the quiet confidence that the schoolman often has in his ability to work in the shop or mill if he wanted to. It needs the personal contact of these two classes of men to develop mutual confidence and respect, with the elimination of ignorance. Happy is the man who combines in himself both the knowledge to think and work.

We are very fortunate in this country in having a society in which the schoolman and craftsman, the engineer and the iron worker, the chemist and the furnace man, meet on common ground, without fear or jealousy, to learn from one another. No society in our day has made more real progress and done more good work than the American Institute of Mining Engineers. Its *Transactions* contain the record, side by side, of the best practice and the highest scholarship. This is the *fellowship* of theory and practice.

Technical schools are not indigenous in this country, they have been transplanted from Europe, and were originally formed on German models. The rapid development of our mines of the precious metals in the west, found us without the necessary technical skill to work them advantageously, and we were particularly deficient, two or three generations ago, in the knowledge necessary to work these ores profitably. German metallurgists came in large numbers to this country, and our young men were sent to German mining schools to fit themselves to take charge of mines and smelting works.

Many of us can well recall the young American return to his native shore after a sojourn of two or three years abroad. He brought back with him an elaborate case of blow-pipe instruments, a collection of minerals and hammers, a well-assorted library, particularly rich in the German classics, an intimate knowledge of foreign social customs, a vocabulary liberally enriched in foreign technical terms, and a look and an air that seemed to say, "I am ready to show you how it is done." They had no difficulty in securing positions to put their knowledge to practical use, and while a few of them were successful, it must be confessed that many of these young men made lamentable failures at the start, causing loss to mine and mill owners, and bringing discredit on systematic instruction. We must also admit that the early graduates of our American mining schools were also often unsuccessful at first. There was evidently something wrong either in the works or in the schools; and as a consequence, the school teaching of practical science sustained a serious check. The schools thought the works were jealous and put obstacles in the young men's way, and the shops thought the teaching of the schools impracticable, and unfitted the men for work. The trouble was simply that the young men had studied one side of the subject and attempted to practice the other. It was the case of an imperfect science attempted to instruct a well developed art.

Very often the trouble arose from the attempt to introduce foreign metallurgical methods into American practice, ignoring the fact that mining and smelting are primarily economic problems, and that the successful treatment of ores in one locality may be a failure in another. It is not in the least soothing to the capitalist, who discovers that his metallurgist uses more money to get the gold from the ore than it is worth, to be told that the process was scientifically correct and had been successfully used elsewhere.

Patience on one side and perseverance on the other brought about, at length, a better understanding, and the practical man recognized that the graduates of the technical schools were the best raw material for making promptly managers and superintendents. The school learning gave him an advantage at every stage of his work over the ordinary workman. This recognition reacted favorably on the schools, and the young men no longer thought their first duty was to instruct, but to apply their school knowledge. There is now no longer any distrust of the schools on the part of the works, in fact we may say that the schools have conquered the works, for the practical managers are now very generally the graduates of technical schools, and are very glad to get young men with technical training. They know just how to treat them and what kind of work to put them at. More than this: these managers begin to discriminate among the schools, finding some young men better trained than others, and there has thus arisen a beneficial rivalry among the schools to give young men the preparation best calculated to secure them places for work. Competition in schools is as healthy as competition in trade, and it is worth while to discuss the question what is the best course to pursue in teaching science as applied to the arts.—*From an address by Thos. M. Drown, published in Jour. Franklin Inst.*

THE ENGINEER.

Trial of the Hydromotor.

A most interesting trial of an invention, which, in the opinion of the naval and technical authorities who witnessed it, promises to effect an important change in the propulsion of vessels of all classes, was conducted on October 11th, on the Elbe, near Dresden. The inventor, Dr. Emil Fleischer, has applied the principle of hydraulic reaction to the propulsion of ships in a manner which, according to the testimony of officers of the German Imperial Navy, like Admirals von Henck and Werner, is as simple as it is effective. It does completely away with all risks from accident to rudder or machinery, for there need be no rudder, and there is scarcely any machinery: solves the problem of avoiding loss of power through transmission, for there is hardly any transmission; and, finally reduces the perils of the sea to a minimum, so far as injuries to the machinery are concerned. For as Admiral Werner explained, the same immense force that propels the vessel can, at a moment's notice, be used to pump her so effectively that she would remain afloat with a considerable leak in her bottom; while in case of fire there would be no difficulty in quenching it.

The vessel, named the Hydromotor, is sixty meters long by seven meters broad, draws .60 meters, and is throughout constructed of iron. The navigation of the Elbe near Dresden presents many obstacles in the shallows and rapids which occur at frequent intervals. Noiselessly and without any oscillation did the large vessel —large as compared with the steam craft plying on that part of the river—after the simple turning of a lever by the Captain on the bridge, commence its trial trip, stemming the current and keeping an even course under the picturesque right bank of the river. The only noise audible was that of the rushing of the water from the tubes, fixed a little above the level of the river, and nearly amidship, on both sides of the vessel. Another turn of the lever and the action is reversed. The vessel comes to a dead stop in less than her own length. By the alternate use of the levers she may be turned round on an almost stationary pivot. The Captain handles the levers on his bridge independent of all communication with the engine-room. The gentleman present watched the trial with the utmost interest. Arrangements are now being made to apply the invention on a very large scale. The opinion of Admiral von Henck regarding the hydromotor is as follows:

"The principle being correct, the invention has almost certainly a future before it if it be subjected to certain alterations. Beyond doubt the hydromotor is eminently useful for river ships, especially in shallow rivers, because it draws very little water, and in canals, because it raises no waves and consequently does not injure the banks. It is also of decided importance as an auxiliary steam engine in sailing ships, when there is no wind — as often happens, for instance, in the Mediterranean and in the tropics. Another advantage it has for sailing ships is that it does not require extra hands. It will undeniably be of value in war ships also, for, auxiliary to the screw, it will considerably increase their power of turning, and therefore, their power for attack and defense. How far the hydromotor will be able to modify or even supersede the present ship engines it is as yet impossible to say. Certainly it will do so to a considerable extent."—*Berlin Corr. London Times.*

A NOVEL STEERING APPARATUS is to placed in the United States tug Nina. The apparatus is the invention of J. J. Kunstadter, a Hungarian, and it has been used with success in Europe. The shaft of the propeller is carried through the rudder-post, and there by means of a universal joint is connected with a shaft running through the rudder, and having at its end a supplementary screw. The universal joint allows the rudder to move freely, and yet establishes a perfect connection between the main and the supplementary screws. It will be readily seen that when the helm is put to port or to starboard the driving power of the supplementary screw is brought into play to turn the vessel. The vessel is thus turned quickly in a small space. In cases where there is danger of collision and the engines are reversed, the vessel can be driven backward and completely out of her course in an exceedingly short space of time, as experiments have shown.

THE CAPE COD CANAL PROJECT seems at last to be in a fair way of being carried out. A company has been organized which evidently means business. By order of the selectmen of the town of Sandwich—through which the canal will pass, a meeting of citizens has already been held to agree upon a price at which the land required will be sold. The improvement is one that is much needed.

THE FIRST LINE OF TELEGRAPH was erected less than forty years ago, and at the present time there are more than 1,000,000 miles in operation. The United States comes first, with 250,000 miles, with the immediate probability of adding another 100,000 miles; Germany comes next with 150,000 miles, and the great Chinese Empire last, with 1,200 miles.

USEFUL INFORMATION.

Animal and Vegetable Stings.

It is well known that the effect of the common or vulgar stinging nettle on the skin agrees very closely with the sensation produced by the sting of a bee or wasp. But the great similarity is not limited to the feeling it causes, but, what may not be so well known, the cause of the irritation produced on the skin is essentially the same. It may be considered as definitely settled that formic acid is present in the poison sac of the bee sting, in the so-called bee poison. The same corrosive acid also occurs in the sting of the nettle. Some species of caterpillars have formic acid in some of their hairs, which they seem to be able to shake off at will, and when a person touches such a caterpillar the poison penetrates the skin wherever it is moist, and causes burning, itching, and inflammation. Those poisonous members preserve their irritating powers even after the death of the worm. This accounts for reliable statements that visitors to collections of caterpillars have suffered from exantbematous eruptions on the neck. "Many hairy caterpillars cause itching and burning of the skin when touched, and sometimes it gives rise to swellings and redness. This depends on the fine hairs, which produce the same effect when they float around in the air. Many ladies who visited the caterpillar room of the naturalist Reaumur had a breaking out on the neck."

As regards the irritative action of stinging nettles and other similar vegetables, it depends, as already stated, on its formic acid. The point of the nettles is brittle as glass, and by the lightest touch penetrates the skin and breaks off, pouring out its acid and causing the burning sensation.

In this little notice frequent mention has been made of formic acid. In conclusion it may be stated that it gets its name from the ant (*formica*), because it was *first* found in them. If it had been found first in the bee or the nettle it would have received another name. If an ant runs over a piece of blue litmus paper, he will leave a red streak. Put a stick in an ant hill, and they will squirt strong acid on it.

It may also he added that the nettle has heretofore been recognized only as a pest to he avoided or destroyed; but now comes the report that in Germany this weed is being extensively cultivated, and an immense number of textile articles are manufactured from its fiber. A Dresden manufacturer has obtained from it the finest thread known to the trade, of which sixty miles in length weighs only two and a half pounds.

A NEW FUEL.—The *Mexican Financier* gives an account of a new fuel invented by a member of a commercial house in the City of Mexico, and for which a patent was obtained from the Mexican Congress in May last. The article is called "turbato," and consists principally of bog peat, of which there are immense quantities in Mexico, mixed with a proper proportion of bitumen. The fuel is made in five different classes, for locomotives, stationary engines, smelting purposes, smith's fires and household purposes. It burns freely, without much smoke, giving a higher dynamic equivalent of heat than the same amount of wood and very nearly as great as the best English coal. It can be manufactured and sold in Mexico at a price considerably below coal or wood, and, looking at the daily increasing demand for fuel, the augmentation in the price of wood, and its growing scarcity, the *Financier* says that it is safe to predict a large and successful market for "turbato." As all the ingredients necessary for its manufacture are found in inexhaustible quantities in Mexico, it will create a new and important industry in the republic.

A NICKEL-PLATED ENGINE.—A model 60 horse-power nickel-plated engine has been recently constructed at the machine shops of Messrs. Duvall & Co., Zanesville, Ohio, to he used in running their works, which are the oldest in the city. The engine is said to he a marvel of beauty, and the machine room in which it has recently been set to running is fitted up with massive black walnut furniture, large mirrors, and other adornments, including gold-fish and flowers, presenting more the appearance of an elegantly furnished parlor than anything else. This engine room has plate-glass windows on three sides the entire hight of the compartment, commanding an extensive street view that exposes it to the observation of every one coming into or leaving the city of Zanesville by rail. To crown the whole, the engine is in charge of Miss Sarah Bogue, niece of the senior proprietor of the works, a beautiful, accomplished and talented young lady, sufficiently acquainted with the science of mechanism to discharge the duties of an engineer.

REMOVING RUSTY BOLTS.—To remove bolts that have rusted in without breaking them, the most effectual remedy known is the liberal application of petroleum. Care must he taken that the petroleum shall reach the rusted parts, and some time must he allowed to give it a chance to penetrate beneath and soften the layer of rust before the attempt to remove the bolt is made. Bolts and studs on which the nuts are fixed with rust are broken off through impatience. In most cases a small funnel built round a stud or bolt end on the nut with a little clay, and partly filled with any of the searching petroleum oils, and left for a few hours, will enable the bolt or nut to be moved.

SAND-SHARPENED FILES.—The value of sand-blast in sharpening files is not limited to the restoration of those that have been worn out, but it is equally evident in the first cutting. Experiments have been tried with bastard files which were finished by the sand-blast upon one side while the other side was simply cut in the ordinary manner; other files of the same size were also tried, which had been worn out and resharpened by the sand-blast. With these files three pieces of gun metal, of equal size and quality, were worked by making fifty thrusts at a time upon each piece, and continuing until one of the files became useless. A similar experiment was tried with cast iron, wrought iron and steel, showing that the newly finished files were the first to give out, and those which were finished with the sand blast were the most durable of all.—*Dingler's Journal.*

LIME WASH FOR WOOD OR STONE.—For a useful lime wash for wood and stone this is the proposed preparation: Twenty liters of quicklime are slaked in a suitable vessel. One gramme of sulphate of zinc and .5 gramme of common salt are added. The latter causes the lime to dry without making any cracks. A very beautiful fawn color is produced by adding to the mixture .5 gramme of yellow ocher, or if a stone color is desired or preferred, two grammes of amber and one of lamp-black may be substituted. A common brush may be used in applying the wash.

FUEL water gas, it is said, has won complete success at Lynn, Massachusetts. The Citizens' Steam and Gas Company, as we noticed some time since, discarded steam heating, and contracted for the Lowe fuel gas process. The latter has been introduced, and gives, in actual practice, most complete satisfaction to the company and consumers. Lynn has one more laurel leaf added to its growing wreath.

PURIFYING WATER.—Water containing vegetable matter may be purified hy dropping in a gallon of the water 2 or 3 drops of muriated tincture of iron. In the course of an hour or two the iron will carry all the organic matter to the bottom of the vessel, leaving the water pure and wholesome. This will not purify water that contains noxious gases, such as come from drains and cesspools.

A NEEDLE'S POINT.—We call a sewing needle a sharp-pointed instrument. At a recent microscopic exhibition, the point of a fine needle was shown upon a screen, magnified to a bluntness of five inches across. Man can not make a sharp point.

AN old but good idea, and one not generally known, is to line the jaw of the vise with sheet lead when clamping saws for filing. If not so lined the saw will vibrate and probably strip the file.

GOOD HEALTH.

Potato Digger's Disease.

Dr. W. Zenker, of Stettin, has recently given a description (*Berliner Med. Wochenschrift*) of a "new disease" which affects farm laborers, particularly those engaged in digging and gathering potatoes. Dr. Zenker calls it a "new disease" in the sense that it has not before been described. He believes, however, that it must have existed for a long time among the peasantry of Germany and all agricultural regions. The disease is thought to he a neurosis of the locomotor apparatus of the feet and legs, the thighs and trunk not being affected. It is caused by the peculiar strained position into which the legs and feet are thrown while digging and gathering potatoes. The laborer, says Zenker, stoops down and supports himself upon the knees and feet. He moves about in this position with the knees strongly bent and feet strongly extended, and he keeps at this for hour after hour for many successive days. The position is not a natural or easy one, and any beginner who attempts it will soon feel a weariness in the limbs.

The result of this kind of labor is that in some cases one or both feet and legs become paretic, the paresis affecting both motion and sensation. The patient finds that one extremity feels heavy, cold, numb, and sometimes painful, and the foot drags in walking. The physician on examining it finds that the movements of flexion and extension are slow and weak. Lateral motion is limited. The affected leg feels colder to the touch than the healthy one. Tests show a loss of pathic and tactile sensation almost complete. In some places electric currents are but slightly felt, while both faradic and galvanic reaction, though present, are feebler than normal. The leg does not atrophy.

A case of this kind may rapidly improve, or it may continue almost *in statu quo* for several years; the patient still walks about, though with a limping gait. The treatment, so far, consisted in foot baths, massage and electricity. It has not always proved successful.

Dr. Zenker reports in detail only five cases, but he believes that the disease can not be a very rare one in the autumn months, and begs that other physicians practicing in the country will report the results of their observations.

We are unable to say whether any such affection exists in this country. It has not been described as yet in any American text book. It would be a matter of interest to know whether any of our readers have come across the disease. —*Medical Record.*

CURING CHOLERA.—Our consul at Port Lewis, Mauritius, communicates to the Secretary of State of the United States the fact that Mr. T. Edward Eyers, although not a physician, has been very successful in the treatment of cholera. It is reported that he lost but one patient out of 150 who were attacked by the disease. Here is the remedy he prescribed: "On the first appearance of an attack there must he administered an emetic of thirty grains of ipecacuanha and two grains of tartar emetic. After the emetic has acted, copious draughts of warm water must be taken upon the stomach. In case either vomiting or purging continues, the usual doses of dilnted sulphuric acid are sure to stop it." Mr. Eyers may be right, and if he is, he has made a discovery that will, so to speak, put a curb in the mouth of that terrible contagion which "stalks in darkness through the land." Only one death out of 150 attacked with cholera is certainly something astounding in the history of the disease.

DIGESTION OF FRUITS.—Fruits are prepared, by the process of ripening, for ready and easy digestion hy the stomach and other digestive organs. Nothing digests more quickly than a ripe apple. This is not true, however, of grains and vegetables. The nutritive elements of these classes of food require the action of heat to bring them into the same condition which is brought about in fruits by the process of ripening. Hence we would not advise any one to attempt to live upon raw grains and vegetables. While it might be possible to maintain life, it would by no means he for the best interests of the digestive organs to adopt such a dietary. We know of no objection whatever to the cooking of food. The heat, in various ways, simply performs a sort of preliminary digestive process, rendering the elements more easily soluble in the digestive juices than they could otherwise be.

TEA AND GIN.—With reference to a paper read by Dr. Benjamin Richardson before the Sanitary Congress, at Glasgow, the London *Standard* points out that "electrical condition, cold and heat, purity and impurity of the atmosphere, foods, drinks, and, of course, narcotics have also a remarkable influence on happiness or unhappiness, by the temporary stimulus which they afford, and the more or less lasting depression they produce. Tea is a "cheerer" Dr. Richardson admits; but, like tobacco and wine, it is also a depresser when the reaction sets in. Indeed, to many people it will be a sort of revelation to learn that it is the cause of almost as much misery as gin, many women, especially in the weaving districts, never knowing a day of felicity, owing to this one destroying cause.

TO CURE STAMMERING.—Dr. Dio Lewis, in his magazine gives a rule for the cure of stammering which is certainly simple enough, and which the doctor says has cured three-fourths of all the cases that he has treated. The stammerer is made to mark the time in his speech, just as it is ordinarily done in singing. At first he is to beat on every syllable. He should begin by reading one of the Psalms, striking the finger on the knee at every word. "Time can he marked," says the doctor, "by striking the finger on the knee, by hitting the thumb against the forefinger, or by moving the large toe in the boot." The writer believes the worst case of stuttering can he cured if the victim will read an hour every day, with thorough practice of this remedy, and observing the same in his conversation.

PEROSMIC ACID is a new remedy employed by Prof. Winiwarter in cancerous and scrofulous swellings. It is used by injecting daily three drops of a one per cent solution of the acid, which treatment causes the tumor to soften and decrease in size; the dead tissue is thrown off and disappears in about a month. No curative effects upon cancer itself have been observed from the remedy.—*Rundschau, Leilm.*

SALICYLIC ACID TO AVOID VARIOLA.—The editor of the *Southern Clinic* certifies along with Dr. Claridge and Dr. De Cailhol, to the abortive power of salicylic acid in variola, given in the ordinary doses. Dr. Bryce thus concludes: "I believe salicylic acid used early and freely will place smallpox in the category with measles, chicken-pox, and other trifling complaints. —*Louisv. Med. News.*

HEALTH OF PRISONERS.—The official returns show that the healthiest class of people in Great Britain are the inmates of prisons, where simple diet, regular hours and exercise are compulsory. But the cases of insanity among the convicts are out of proportion to the number of ailments. To commit a crime a man must be more or less mad.

TABLE OF CONTENTS.

EDITORIALS.—The Bower-Barff Process—No. 2, 377. Passing Events; Field Work in Surveying Claims; Miners' Life-Saving Institution; Bismuth; An Improved Ore Mill; Lead Smelting Fuel, 384. An Improved Upright Drill Press; A Rich Copper Region; Blasting in Mines—No. 17; Publishers' Card; The Red Sunsets; Collecting Flue Dust—No. 4, 385.

ILLUSTRATIONS.—The Bower-Barff Furnace, Horizontal Sections, 377. An Improved Upright Drill Press, 385.

CORRESPONDENCE.—The After-Glow, 378.

MECHANICAL PROGRESS.—Grinding and Polishing Metal Surfaces by Hand; Starting Fires; Strains on Iron and Steel; Tightening Pulleys; Sticking a Knife Through a Boiler; A Grinding Machine; A Hint to Manufacturers, 379.

SCIENTIFIC PROGRESS.—Evolution; A Vacuum a Good Conductor; Photography of Moving Objects; Photographing the Solar Corona without an Eclipse; Magnetic Rails; Latest from the Lick Telescope; Nitrification in the Soil; Saturn, 379.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 380-81.

THE ENGINEER.—Trial of the Hydromotor; A Novel Steering Apparatus; The Cape Cod Canal Project; The First Line of Telegraph, 383.

USEFUL INFORMATION.—Animal and Vegeable Stings; A New Fuel; A Nickel Plated Engine; Removing Rusty Bolts; Sand-Sharpened Files; Lime Wash for Wood or Stone; Purifying Water; A Needle's Point, 383.

GOOD HEALTH.—Potato Digger's Disease; Curing Cholera; Digestion of Fruits; Tea and Gin; To Cure Stammering; Perosmic Acid; Salicylic Acid to Avoid Variola; Health of Prisoners, 383.

MISCELLANEOUS.—Mining in Arizona; Recollections of California Mining Life; Technical Training, 382.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 388.

NEWS IN BRIEF—On page 388 and other pages.

BUSINESS ANNOUNCEMENTS.

Dividend Notice—Silver King M. Co., S. F.

☞ *See Advertising Columns.*

Passing Events.

The magnificent weather continues with us, the mornings being frosty and clear, with warm, sunny days, and no present indications of rain. The peculiar reddish glow in the sky in the early morning and late evening seems to prevail over a large extent of the country, and many theories are advanced to account for it. We refer to the subject quite fully elsewhere.

All the trails and roads in the Cœur d'Alene country are covered with snow, so that there is no use in any miners thinking of doing anything in that region for many months. It is evident, however, that there will be a rush there in the spring, and many are already making plans to go to the new diggings.

Mining matters are rather quiet generally just now. The highly important debris suit is still pending, though the Judge may give his decision any day. In fact, it is hourly expected.

MECHANICS' FAIR.—The fair recently held in this city under the auspices of the Mechanics' Institute, was more successful financially than was expected. At a meeting of the Institute on Saturday it was reported that the receipts this year from all sources had amounted to $47,446.69, and the expenses $21,827.01, leaving a profit of $25,619.68, of which $17,500 had been transferred to the institution.

THE Red Cloud Consolidated mine, Noonday mine and North Noonday mine at Bodie were recently sold by the Sheriff for $250, subject to demands amounting to $524,676. The sale includes all the properties of those incorporations, real and personal.

Field Work in Surveying Claims.

It has been customary to require from applicants for mineral surveys a deposit sufficient to pay all expenses incident to a survey of the tract applied for, this deposit to equal the estimated cost of a survey, plat and publication of the notice, and be made before commencement of the survey.

A short time ago a miner made application for patent, but selected his own Deputy Mineral Land Surveyor and paid him. When he came to deal with the Surveyor-General a deposit was required for a mineral surveyor which he refused to make, having already employed a duly certified mineral surveyor. The Surveyor General registered his application and the miner then appealed to the Commissioner of the General Land Office, who decided that the Surveyor-General was right, and rejected the application because unaccompanied by a deposit of money with the Surveyor-General for survey by an U. S. Deputy Surveyor. The miner was still unconvinced, and again appealed his case to the Secretary of the Interior. That official, after studying up the matter, has now decided that the miner was right, and the Surveyor-General and Commissioner of the General Land Office both wrong.

Under the old law of 1866 the applicant had to pay all the expenses incident to the survey of the tract, and the regulations required from him a deposit equal to estimated cost of survey, plat and publication of notice, before the commencement of survey.

The ninth section of the act of May 10, 1872, repealed the section of the old act which required this deposit, but Sec. 12 of the act of 1872, continuing the requirement that the applicant should pay the expenses of survey and publication of notices, authorized him to obtain the same at the most reasonable rates, and to employ any United States Deputy Surveyor to make the survey. It also empowered the Commissioner of the General Land Office to establish the maximum charges for such surveys and publications, and, in case excessive charges for publication, to designate any newspaper published in the proper district, and fix the rates to be charged; and to the end that he might be fully informed on the subject, the applicant was required to file with the local officers, for transmission to the Land Office, a sworn statement of all charges and fees paid by him for publication and surveys, with all fees and money paid such officers.

This section was intended, apparently, to protect applicants for mining patents from unjust charges for survey and publication, authorizing them in respect to the survey personally to contract with a deputy surveyor for his services upon such terms as they might agree upon, and the Land Office to control the cost of publications. This section was incorporated into the Revised Statutes as section 2334, and is still in force.

The "Mining Laws and Regulations," published by the Land Office, Oct. 31, 1881, after saying that Surveyors-General would, in pursuance of said section, "appoint as many competent deputies for the survey of mining claims as may seek such appointment, it being distinctly understood that all expences of these notices and surveys are to be borne by the mining claimants and not by the United States;" further says; "the system of making deposits for mineral surveys, as required by previous instructions, being hereby revoked as regards field work, the claimants having the option of employing any deputy surveyor within such district to do his work in the field." The Secretary of the Interior in his decision defines field work to be the surveyor's notes of hearings, distances, etc., in the field, or a determination on the land of its form, extent, position, etc., by means of certain measurements. This constitutes the survey, and it is in relation to such work that the applicant for patent is authorized to contract as he pleases, and in relation to which also the Land Office regulations revoke the former rule requiring a deposit with the Surveyor General, no such deposit being now required. The first decision rejected the application for survey, because the miner did not make a deposit, and is inconsistent with the regulations and erroneous under the law. The platting of the claim is no part of the survey, but shows only what the surveyor has done, and is office work, for which the regulations properly provide that the claimant must make a deposit. Under this decision of the Secretary, the applicant for mining patent may contract with any U. S. deputy surveyor for the field work in making the necessary survey; but the office work must be done by the Surveyor General. This case did not occur in this State, where it has been the custom to allow applicants to contract with the surveyor themselves, without interference from the Surveyor General.

Miners' Life-Saving Institution.

In England, it is stated by the Home Secretary, some 2,500 miners lose their lives every year by explosions, floodings and other accidents. No public effort has been taken to reduce the mortality, though some miners take all the precaution possible. A society has now been formed, however, which is called the "Royal National Miners' Life-Saving Institution," and which is promoted by many distinguished men. Its object is defined in its title. It is the intention to provide certain approved breathing apparatus for use in colliery explosions. To provide "refuges" for miners (Fenwick's or other system) and any other appliance for affording men shelter after explosions or in floodings, and for repairing sheltered headgear, or for clearing the ways destroyed by explosions at mines, in order to get at imprisoned miners expeditiously, whether in the workings or refuges; also to provide other suitable apparatus, appliance or means for saving life in explosions or the floodings of mines. To form a staff of volunteers selected from the brave miners at every colliery and mine in the United Kingdom to descend mines and rescue human life upon explosions, floodings or any other accidents or position of danger. To establish an ambulance corps, consisting of the miners at every colliery in the United Kingdom, who will always be trained ready to give first aid to the injured miners by explosions or any other causes, until the arrival of medical assistance. To give effect to any other apparatus, appliance or means to save human lives, such as by the advising of barometrical warnings to the collieries or stations of the institution, or through the press, and the placing of suitable barometers wherever desirable.

The institution is to be supported by voluntary contributions and donations from the colliery owners, iron, stone and other mine owners, working miners and the general public. They intend carrying on the good work until every colliery and other mine in the United Kingdom shall have been thoroughly equipped in life-saving apparatus and other means of rescuing suffering humanity. For daring deeds of miners and others, where lives have been saved or brave attempts made to save lives, although unsuccessful, at mines, the institution will confer honorary rewards in the form of medals or votes of thanks, and will also make liberal grants of money.

Bismuth.

The production of metallic bismuth in the United States has thus far been of no importance. The ores, which in small quantities at least, are widely distributed in this country, give promise that in the future the production of bismuth may become a regular industry. The metallurgical processes for the extraction of the metal from its ores are quite simple. Bismuth ores occur in many of the States and Territories on this coast. There is one important deposit in Utah. Some has been found near Phœnix, Arizona. The usual ore is sulphide. This ore is found in small quantities as a sulphide in a large proportion of the refractory ores of the Rocky Mountains, and in considerable quantities in certain rivers in Boulder and La Plata counties, Colorado.

There is a lode called the Bismuth Queen, not far from Golden, Col., which shows a vein of bismuth ore varying from two to eight inches in width, in which the metal occurs in the process of bismutite and bismuthinite, carrying sometimes as high as 80 per cent of metal. A telluride of bismuth called tetradymite has lately been identified in Arizona. Bismuth has been found also in this State, but it has not been worked to any extent to our knowledge.

MINING BUREAU.—We have received from Henry G. Hanks the third annual report of the State Mineralogist, which we shall notice more fully next week. It is largely devoted to the consideration of borax deposits.

An Improved Ore-Mill.

Some little time since we illustrated and described the ore pulverizer invented by Wm. I. Tustin, of this city. Guided by the experience gained in many months' active work, Mr. Tustin has made a number of improvements on his original design, and has patented them. One of the principal improvements is in regard to the construction of the trunnion of the cylinder or band upon one side, its connection and arrangement with the indicator-shaft, and the means for oiling the parts. The indicator-shaft is now supported entirely upon and within one trunnion, leaving the other free for entrance of ore from the hopper. By the peculiar construction devised in the overlapping of joints, etc., it is impossible for any grit to find its way to the journals. To lubricate the bearings the indicator-shaft is made hollow from its outer end where the oil cup communicates with it, to a point near its inner end, and small holes are drilled through the shaft to allow the ore from the hollow center to escape in order to lubricate the exterior of the shaft.

The man-hole plates and the screens are secured in a peculiar manner. A water-distributer is also supplied to discharge water on the screens to cleanse them, and passing through to wash the pulp or pulverized material out of the barrel.

To regulate the movement of the swinging hopper and the feed, means are provided for holding the hopper further from or closer in contact with the ratchet-cam, whereby the jar or concussion may be increased or diminished, or caused to cease altogether, and the feed stopped.

To do this there is a shaft, having on one end a cam, operating against the arm of the hopper. This shaft carries on its other end a wheel having a toothed periphery which is engaged by a spring pawl. By turning this wheel by means of a crank the cam forces the hopper in or out, regulating its swing, and consequently the feed. All these improvements relate to matters of construction whereby the parts work together to better advantage in accomplishing the result.

Lead Smelting Fuel.

The fuel used for lead smelting on this coast is either charcoal or coke or both mixed. In many places attempts at smelting with charcoal alone have failed. Most of the oak out here is poor, and hard charcoal from mahogany, cedar, etc., is also to be rejected for use on a blast furnace because it decrepitates into small particles, which have the same effect as coal slack or waste in chilling the slag through reduction of the temperature. Nut pine (pinon) makes the best charcoal, and this was formerly the principal fuel of Eureka. Charcoal from lighter woods such as yellow and white pine, Mr. O. H. Hahn tells us in his article on the subject of "lead," in a late government report, cannot be used alone without reducing the temperature of the furnace. The same authority says the best coke or the English patent coke is shipped annually from Cardiff to this port. It is porous and light and leaves a very small percentage of ash.

Owing to the different fusibility of different ores, the percentage amount of fuel must be referred to tons of charge in comparing the consumption of various localities. This brings out the remarkable fact that smelting at a high altitude requires more fuel than at a lower one. In Leadville, for instance, the consumption of mixed fuel amounts to from twenty-two to twenty-four per cent of the weight of the smelting mixture, which, in Salt Lake City, amounts to fourteen to seventeen per cent, the lower figure corresponding to the summer, and the higher to the winter season, when the ores absorb more moisture than in summer.

Where charcoal alone is used, it is said the percentage of fuel is somewhat higher, probably between twenty-six and twenty-eight per cent. It is always advisable, in the interest of regularity of furnace operations, to weigh not only ore and flux, but also the fuel, as accurately as possible.

MR. JOHN C. TAPPERINER, the inventor and patentee of the improved assaying furnace, was killed during the raid of roughs on the town of Bishee, Arizona, last week. He was assayer at a mine in the camp, but unfortunately was one of the victims of the cowardly attack made by the desperadoes.

An Improved Upright Drill Press.

The engraving on this page shows a new improved upright drill press, which is, in very many respects, a decided improvement in drill manufacture, and combines many important and desirable features. Its automatic drilling capacity is 24 inches, which, it is claimed, exceeds the ordinary 50-inch drill. This capacity extends the whole length of the column. In the case of many drills the face of the column projects from two to four inches beyond the lower part of the column, thus losing that much swinging space when long work is being drilled. The head of this drill is both automatic and adjustable, with rack and pinion, and can be placed any desired hight on the face of the post instantly, without the use of any bolts. The point of the drill is always the same distance from the head, thus avoiding any spring as in ordinary cases where there is a quill ten to twelve inches long. The bearing on the spindle is the same as that of head spindle to an engine lathe, and in case of wear can be taken up in the same manner. This enables the boring of a perfect hole. The manner in which the holes through the boxes for spindles, as well as the hole for table, are bored insures a perfect alignment, which is certain to bring all parts square when finally put together.

To obtain a quick return movement to head and spindle, the worm is not, as is usual, disconnected for the purpose of adjusting the head, but is connected and disconnected by means of a clutch, which is very conveniently operated, by pulling out and pressing in the lever or handle in front. To connect the gear with the shaft the lever is pulled out, to disconnect it is pressed in. The back gear shaft has a bearing at both ends, which makes it so much firmer than being supported at one end, as in ordinary cases. The feed cone on top shaft runs independent of the shaft, and is connected and disconnected by means of a lock plate and thumb screw, and when the power feed is not in use remains stationary without throwing off the belt.

The drill is made from the best of stock. It is well designed, well proportioned, and extra heavy, very stiff and powerful. The base and column are uncommonly large. The back brace is made from one solid piece, weighing more than 200 pounds. Weight of machine, 1,900 pounds. Swing, 24 inches. Greatest distance from base to spindle, 52 inches; greatest distance from table to spindle, 40 inches; face of column on which head slides, 7¼ inches wide; head is 12 inches long, and has a bearing the entire length. Automatic feeding capacity, 24 inches; diameter of spindle, 1¾ inches, with 1¼ inch bearing in head box. Vertical movement of head and spindle, 24 inches; vertical movement of table, 22 inches. That portion of the table which rests upon the arm has a bearing surface seven inches diameter.

The cones are large, have wide sections using three-inch belts, and are placed as far apart as possible, using long belts, which adds power to the machine. The driving pulleys are 12x4 inches, and should make 200 revolutions per minute. The drill is for sale by Parke & Lacy, Nos. 21 and 23 Fremont street, S. F., sole agents for the coast, who should be addressed for further information. A 26-inch drill is also made of the same type, to which the same general description applies.

A Rich Copper Region.

The entire range on the northern side of Soda Springs Valley, near Luning, Nevada—some twenty miles in length by ten miles wide—is prolific in copper deposits, many of which are true-running contact lodes of unusual magnitude and promise, though not as yet proven to any considerable depth.

The ores are, in the main, high grade and of easy smelting quality, being mostly red and black oxides, carbonates and silicates, with but rarely admixtures of sulphides.

There is generally at or near the mines water sufficient for camp purposes; and the claims are of easy access from the railway stations in the valley through the *arroyos* which cleave the range, and afford natural roadways of easy grades.

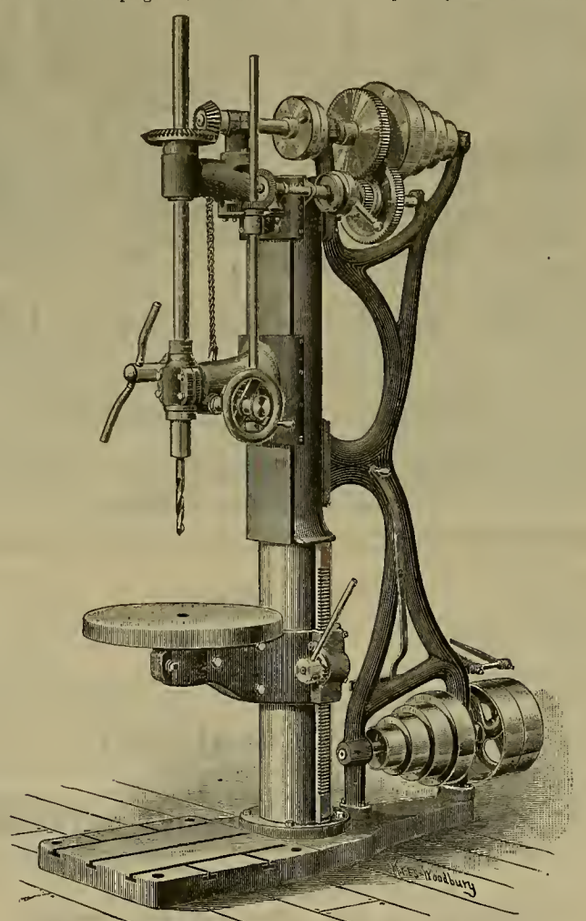
Water for smelting operations may be found anywhere near Luning at a depth of 60 or 70 feet, or may be brought by pipe-line from adjacent mountains.

Blasting in Mines—No. 17.

Directions for Using Vulcan Powder.

Vulcan powder is a nitro-glycerine compound, largely used on this coast. Three grades are made by the Vulcan Powder Co., of this city. No. 1 is for very hard rock, bowlders, iron, etc. No. 2 is for sinking and drifting in medium hard rock, sandstone, limestone, etc. No. 3 is for bench work, pipe-clay, cement, soft and shelly rock, quarrying, etc. A low grade powder called "Vulcan B. B.," is also made for use in rock such as bank blasting, railroad cuttings and grading. It is a dry, granulated powder, composed of ingredients similar to those of ordinary black powder and contains no nitro-glycerine or chlorate of potash. It does not freeze, nor being affected by temperature.

The following directions for the use of Vulcan powder are those issued by the manufacturers. At times it may be expedient to vary from set rules, but under ordinary circumstances it will be best to adopt a system that has found favor with the most experienced miners.



In charging a hole, ram each cartridge "well home with a wooden tamping bar; cut the end of the fuse square; push the cap on it until it reaches the fulminate, then nip the cap tight to the fuse with a pair of nippers. In wet holes, rub some grease or soap around the cap to make it air and water tight on the fuse. The cap must be squeezed tight to the fuse to insure a perfect blast. If loosely put on, the explosion may not be complete. Use a priming cartridge (this is about an inch and a half or two inches of cartridge, into which the cap with fuse attached is inserted), and let this priming cartridge down the hole until it rests on the powder. Then tamp with water, sand or clay, or use no tamping, as you think best. Vulcan powder is equally effective in wet or dry holes. The explosions of Nos. 2 and 3 Vulcan is rendered more effective by using a priming cartridge of No. 1.

On account of its strength, excellent execution is done with Vulcan powder without tamping it. However, when well tamped more work is done, the amount of power gained being in proportion to the excellence of the tamping. It is advisable to tamp the first four or five inches lightly. Tamping also produces a more complete explosion, and hence lessens the quantity of fumes.

Vulcan powder freezes at about forty-two degrees Fahrenheit, and gradually becomes hard. In this condition it cannot be exploded with the blasting caps. If not already frozen when received at a mine, it should be kept in some warm place where it cannot freeze, to save the trouble of thawing it. Powder should never be used for blasting when frozen. If it should freeze when in a drill hole, it can be exploded by using a heavy primer of well thawed Vulcan powder. Never, under any circumstances, attempt to pick out a charge of frozen powder from a drill hole; it is always attended with some danger.

To thaw frozen Vulcan powder, use the Vulcan powder thawing box as follows: Place a funnel in the hole at the top of the box, and fill the outside case with hot water; then put powder into the center chamber, and screw down the top. If, after two hours, the powder is still frozen, change the water, again putting in hot water. Keep the center chamber clean.

The "Vulcan B B," of which we have spoken above, should be used in exactly the same way as you would ordinary black powder. "Vulcan B B" can be exploded with an ordinary fuse. No cap is required. In drill holes the powder must be well confined and thoroughly tamped to secure good results. Tamp the powder itself before putting in the tamping. In drill holes, it is highly important to tamp the powder itself perfectly solid with a modern tamping bar before putting in the tamping. The Vulcan Powder Company, 218 California street, in this city, will give full particulars regarding their various grades of powder to those desiring it.

AN IMPROVED UPRIGHT DRILL PRESS.

Publishers' Card.

The undersigned return their most sincerely appreciative thanks to MR. AND MRS. CHAS. G. YALE for the exceedingly recherche reception tendered them on the twentieth anniversary of the firm of Dewey & Co., at the former's pleasant home in Oakland, last Saturday evening. It was doubly enjoyed for its substantial character and the kindly spirit and graceful manner in which it was presented throughout. Mr. Yale's long-continued and pleasant association as a co-laborer with our firm, renders this personal recognition a more than ordinarily pleasant acknowledgment.

A. T. DEWEY.
Dec. 15, 1883. W. B. EWER.

THE trails to the Cœur d'Alene mines are almost impassable, the snow is so deep,

The Red Sunsets.

The peculiar appearance of the sky just after sunset—which we have all noticed of late—appears to prevail all over the country, being by no means local, as was at first supposed. It is noticed in the Eastern and Southern States as well as in the West. On another page we print a communication on the subject which will repay perusal. At the last meeting of the California Academy of Sciences the subject of the bright, reddish glow in the Eastern and Western heavens near sunrise and sunset was adverted to, and the President, Prof. Davidson, made the following general statement:

Supposing that the red sunsets and sunrises might be possibly owing to a large amount of moisture in the atmosphere, I examined the western sky with the spectroscope, and could see no indications of any unusual amount of aqueous vapor; but continuing to watch the changes of the glowing red some time after the sun had set, I saw that this red glow existed only where there were pronounced streaks of moderately thick smoke. The outlines and the intensity of the glow conformed to the outline and density of the smoke currents. As a light northerly air blew the smoke to the southward, the northwestern part of the horizon lost its glow, but that to the southwest continued.

This effect of the smoke was not the same as if a great dense atmosphere of smoke pervaded the air for miles seaward as we frequently have it from the fires of the Oregon forests, when the sun appears red, even as far south as Cape San Lucas and the Sandwich Islands, and actually sets almost obscured. In this red glow Venus shone conspicuously bright and white every evening through the red.

It will be remembered that there had been little or no wind about the peninsula and bay of San Francisco; the smoke from its thousand factories and engines settled over the city and bay, and moved but little in any particular direction. From my observatory I could, at times, not see Mission bay on account of the density of this smoke. At the same time we knew we had large forest fires on the coast, and especially to the southward. Capt. Lawson, of the Coast Survey, writes from the mountains on the seaboard near San Luis Obispo, that he has the same red sunsets and sunrises, but does not assign any cause.

It has been asserted that probably the pumice ashes from the newly-formed volcanic island of Bogostov, north of Unalaska, in latitude 53° 57′ and longitude 167° 50′, have been carried through the atmosphere to this coast, and caused this peculiar sun effect. But Captain Anderson had some trouble in gathering two small vials of the pumice stone ashes at Illioulioukorg, forty miles east of Bogostov, whereas we are 1,500 miles therefrom. Moreover, neither Captain Anderson nor Captain Hague, who passed close to the new volcano when the sky was charged with the smoke, steam and pumice stone ashes, report any peculiarity of the sunsets in that region. Nor have we any such report from the region of Java after the August volcanic eruption.

If there is any pumice ashes, or any meteoric dust to occasion a universal red sunset or sunrise, we should be able to detect it on the snows of the Sierra Nevada, or other snow ranges.

So far as my experiments and observations guide, the cause in this vicinity was solely the local distribution of the smoke.

Collecting Flue Dust, No. 4.

After the first trial the hanging plates were introduced into Sections VI, VII, and VIII, a section of which is shown at Fig. 11. They were then introduced on a much larger scale in Sections V, VI, VII, VIII, and IX, as shown in Figs. 16 and 17. [See PRESS of Dec. 1, page 353.]

The method of hanging-in the sheet-iron consists in placing a rectangular bar of iron, which has been pierced with the requisite number of holes, on its edge, in the spring of the arch, if the arched form of the flue is used, or at the proper hight in the rectangular ones. This bar is twisted flat at its ends so as to enter the wall about 3 cm. Iron pins, 10 cm. between centers, are driven into the holes, projecting 3 to 4 cm. on both sides. A piece of iron, D, Fig. 17, bent to form a hook, is riveted upon the ends of each sheet, so that it simply drops on to the pins, and hangs at each end supported in a vertical position. So arranged, the sheets can be put up or taken down with the least possible trouble. To simplify the construction, a punching machine is used which pierces two holes at once in the sheet-iron at the proper distance from the edge. The iron which forms the hook L, Fig. 17, is punched in the same way. The riveting is done with two or three blows of the hammer. When the sheets are hung upon the pins they fill up the flue, and have between them in the direction of the length of the flue only the thickness of the iron bars on which they rest. These sheets do not make any perceptible reduction of the total volume of the flue, but they increase the condensation surface enormously.

THE furnaces of the Owens River Mining and Smelting Company, at Ætna, Inyo County, fired up on Sunday, and are running successfully. The company have several thousand tons of ore on hand for smelting.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

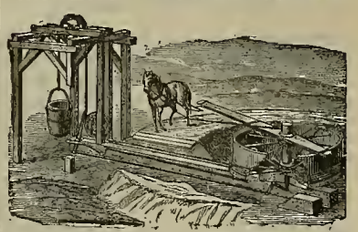
WANTED.

A position as Mining Engineer or Metallurgist, by a graduate of a German Mining Academy, having had over 20 years' experience in the working of mines and treatment of all classes of ores; expert in concentration of ores. Apply to A. H., this office.

Tustin's Pulverizer



WORKS ORE WET OR DRY.

MANUFACTURED AT

The Tustin Windmill Horse-power and Pumping Machine Works.
308 Mission Street, S. F., Cal.
By W. I. TUSTIN, Inventor and Patentee.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 in Actual Use.

EDWARD A. RIX,
MANUFACTURER,
18 and 20 Fremont St., - San Francisco

Engraving Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorabl rates.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kilu Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

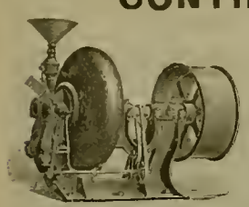
HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.



LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x00. PLAIN SLIDE VALVES from 6x10 to 30x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

Has no surplus verbiage. Contains Dr. Raymond's Glossary. Explains how to examine mining titles. Contains numerous court decisions. Gives the Public Land Commissions Codification, and gives many an d improved forms. Price—Full law binding, extra paper, $3.00.
For Sale by DEWEY & CO., San Francisco.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this offices at published rates.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Savee from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.
A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiere & Hayee, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we borowith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company
That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.
That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.
That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.
That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.
That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,
Room 7, 109 California Street, - - - SAN FRANCISCO, CAL
Nov. 6, 1882.

William Hawkins.

(SUCCESSOR TO HAWKINS & CANTRELL).

289,559.—PUMP AND WATER-WHEEL—Sam'l S. Richardson, Happy Camp, Cal.

289,560.—WATER MOTOR—Sam'l S. Richardson, Happy Camp, Cal.

289,450.—SPRING BALANCE COUNTER SCALE—F. W. Runge, S. F.

289,719.—DEVICE FOR SECURING WHEEL TIRES—L. Shelton, Santa Rosa, Cal.

289,576.—SAW TOOTH—Eugene Smith, S. F.

289,791.—DRY ORE PULVERIZER AND CONCENTRATOR—Adam Wingard, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through DEWEY & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of speeial mention:

DIRT SCRAPER.—James Porteous, Fresno, Cal. No. 289,134. Dated Nov. 27, 1883. These improvements in scrapers for leveling land consist in the means for regulating the dump of the bowl. The object in this is to cause the bowl to discharge the load more or less quickly by regulating the distauce of its bit from the ground when in the dumped position. In case of a decided depression in the ground, it becomes necessary to discharge the load at once, and this is accomplished by so regulating the dump of the bowl that its bit shall be high enough from the ground to let the dirt escape. In case but a thin layer need be spread, the bit is raised but little and it acts as a scraper, spreading the slowly-discharging earth over a greater surface. This result, namely, the limiting of the dump of the bowl, has been heretofore accomplished by means of a bar set trausversely over the top between the ends of the bowl, said bar coming in contact witb the draft rods; but the present construction overeomes any objections there may be to the previous method.

KEY-SEAT CUTTING MACHINE.—Geo. W. Bonds, S. F. No. 289,060. Dated Nov. 27, 1883. This is an improvement in that class of machines for cutting or slotting keyways in wheels, pinions, pulleys, etc., where the wheel is made with teeth or cutters on the edge, like a milling tool, and of the exact width of the slot to be cut. It consists of a moving table provided with suitable adjustable jaws and slots and slots for fastening the work to be operated upon, and both hand and automatic feeding attachments to move the work to the cutter, instead of feeding the cutter to the work, as is eustomary in this class of machines. An automatic relief motion is provided to save the wear of the cutter ou the back stroke, as is also an automatic stop to gauge the cut to any desired depth. The eutter and cross-bead are provided with adjustmeuts to fix the taper at any desired angle, and they are locked with adjustable steel rollers below and above the cut to prevent springing, thus making tbe keyway exactly straight.

CABLE-GRIP.—Beujamin F. Carman, S. F. No. 288,960. Dated Nov. 20, 1883. This is a new form of grip for eable-railroad cars, by which the car and eable are connected and dis connected at pleasure. The invention consists in a grip having flexible or pointed jaws, means for retaining the cable between the jaws when partially opened, and a peculiar lever and pawl mechanism for operating the jaws to grip or release the cable.

DESIGN FOR WIRE FENCE.—Gaspar Hunziker, Cloverdale, Sonoma Co. No. 14,442. Dated Nov. 27, 1883. The design consists in the combination of two or more nettings with different sized meshes. The leadiug feature of the design consists of a series of parallel horizontal sections of nettiug, haviug meshes of different sizes, said sectious being united at their cdges so as to form a panel.

PUMP.—Clarence T. Fouts, S. F. No. 289,079. Dated Nov. 27, 1883. This consists of an improved force pump, the air chamber, ingress and egress valves and plungers of which are located within a containing-case or chamber of larger diameter.

IF YOU want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. Co., for "Lubrice." It is the best compound-grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils

Mining Share Market.

No event of importance has occurred to stir up the share market sufficiently to attract special attention to its doings. They are working away on the Comstock trying to find a bonanza, but none has come to light for a long time. At Gold Hill the Yellow Jacket folks are now extracting 120 tons of ore per day, or over 800 tons per week. The Belcher, Crown Point and other companies are taking out a'l the ore the mills can crush in the present low stage of water in the Carson river. The Alta folks have the water out of their mine nearly down to the 2150 level. As the pumps are now drawing the water from about 3,000 feet of drifts, progress is at present rather slow. The draining of the Alta will allow of work being resumed in the Benton, and the Justice folks will also doubtless resume operations, drifting into their ground from the Alta, as they had arranged to do before the flooding of the latter mine. The Hale and Norcross folks are sinking the winze below the 2700 level at the rate of 20 feet per week. They will continue to work on this winze until the starting up of the new hydraulic pump enables them to resume explorations on the 2700 level. The connections for the new pump (at the 2400 level) are now in, and the whole machinery of the pump is on the ground ready to be lowered and put in place at the 2600 level. With the starting of this pump work will be resumed on the 2600 level of the Chollar-Potosi.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties conneeted with the interests specially represented in its columns. Persons so receiving eopies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in tbe cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Bullion Shipments.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receivi ng accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Pateuts in all countries which grant protection to inventors. The large majority of U S. and Foreign Patents issued to inventors on the Pacific Coast bave been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.

DEWEY & CO., Patent Agents.

Addresses. Business letters should be addressed and drafts made payable to DEWEY & Co.

NEVADA COUNTY BULLION.—The Nevada City (Cal.) *Transcript* says: The shipments of gold bullion through Wells, Fargo & Co.'s Express office at this city during November amounted to $125,000, or $8,000 more than for the corresponding month of last year. We hope that our exchanges in condensing this item will not give the above figures as the month's production for all of Nevada county, which is a mistake they often make. The office at this city is only one of five in the county that gold is being sent through all the time, and the total gold yield of the county has been upward of $3,500,000 per annum for several years past. Our Handbook of Nevada County, which is now being printed, gives some valuable information on this point.

NEW AGENCIES.—The new firm of Coit & Folsom, No. 10 California St., in this city are now the selling agents for the Reading Iron Works, wrought iron pipe, boiler tubes, etc., the A. Burritt Hardware Co., malleable and cast iron fittings; Reading, Bolt and Nut Works, bolts, nuts, boiler rivets, etc.; and A. H. McNeal cast iron, water and gas pipe. The firm also furnish prompt quotations for the Central Iron Works, boiler and tank iron; and the Pencoyd Iron Works, structural and shapo irons. All these various establishments rank high in their specialties, and this is the first time some of them have been represented on this coast.

COEUR D'ALENE means the iron or steel-hearted, and was first given to the savages of that region because of their peculiar implacability.

NOTICE OF ASSESSMENT.

The Land Purchasers' Association.—Location of principal place of business, San Francisco, Cal.

NOTICE IS HEREBY GIVEN, that at a meeting of the Board of Directors, or Trustees, held on the 5th day December, 1883, an assessment of five dollars ($5.00) per share (being balance of 44th and part of 45th installments) was levied upon the capital stock of this corporation, payable immediately to the Secretary at the office of the Company, 318 Montgomery St., San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 7th day of January, 1884, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 12th day of February, 1884, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

EDWARD P. GRAY, Secretary.

OFFICE—318 Montgomery St., San Francisco, Cal.

N. B.—This Assessment is to pay the taxes on the property of the Association for the current year.

Mining Companies.

THE ROLLER ORE FEEDER.

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

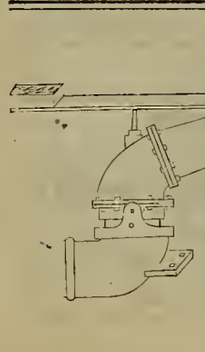
THE CONSUMERS' COMPANY.

VULCAN B B,

Black Glazed Powder,

In kegs and cases. The Best Low Grade Explosive in the market. Contains no Nitro Glycerine. Superior to Judson or any Black Powder made.

Is Unequaled for Bank Blasting & Railroad Work.



VULCAN NOS. 1, 2 AND 3,

The Strongest, Most Uniform and best Nitro Glycerine Powder manufactured, and which we are prepared to furnish at very lowest prices.

Caps and Fuse of all Grades at Bottom Rates.

VULCAN POWDER CO.,

218 California St., San Francisco.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, DECEMBER 22, 1883.

VOLUME XLVII Number 25.

The Mining Bureau

State Mineralogist H. C. Hanks has sent to the Governor his third annual report for the year ending June 1, 1883. The actual report only occupies some 26 pages; but there is a very exhaustive "Report on the Borax Deposits of California and Novada," giving the production, consumption, uses, history, chemistry and mineralogy of boracic acid and its compounds, and other general information, with a map showing the principal localities in the two States. This portion of the report is illustrated, and occupies upwards of 100 pages. We shall refer to it more fully on another occasion.

In the report proper, Mr. Hanks gives a list of donors whose contributions have been entered on the catalogue. The donation to the museum and library have been of universal interest, and many of them of great value.

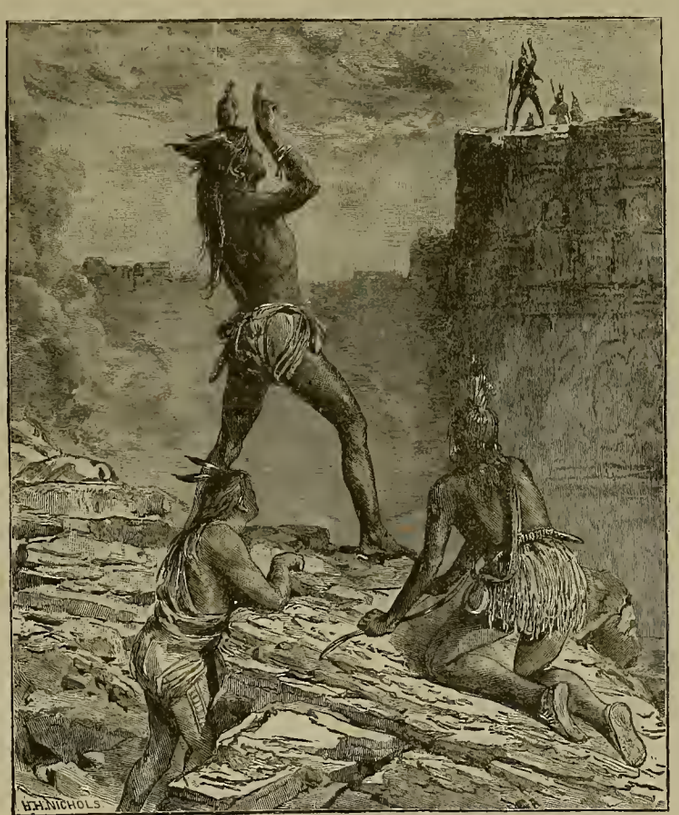
The importance of complete analyses of ores, minerals, mineral waters, building stones, rocks, limestones, cements, fertilizers, etc., laboratory experiments bearing on the working of complex ores, and a careful study of low-grade ores, and those requiring concentration, is fully realized by the State Mineralogist; and a course of such work was early planned, the results of which it was hoped would form an interesting and important part of the annual reports.

Owing to the forced closing of the laboratory and discharge of the chemist, there is but little chemical work to report. Many examinations of minerals have been made by the State Mineralogist personally, and information sent to those asking it; but this class of work has not been done to the extent it should be, for reasons set forth. A number of analyses of coal from newly discovered localities, and of ores and minerals, in a few cases have been made; but the meager results have been reserved for future publication. The books of the Bureau show a deficiency of $3,864 for it this year, which has been advanced from time to time by Wells, Fargo & Co. Every economy has been practiced, but Mr. Hanks states that had it not been for the liberality of the company the institution would have been compelled to close its doors.

It has become apparent that it was a mistake to appropriate an uncertain sum for the support of a noble State institution. It would have been better to have set aside a fixed sum, even if smaller, and allowed the tax transfer fund to revert to the State.

The State Museum has only been brought to its present condition by much labor and no inconsiderable expense. As now arranged, it will compare favorably with those of other countries, according to the verdict of many persons who have visited similar institutions both at home and abroad; yet there are other specimens on hand, classified and arranged, in sufficient numbers to double those now on exhibition. They are packed in boxes in another room, and await the purchase of cases for their display. The specimens already in the museum are crowded for want of case room. They should occupy from six to ten cases more, to show them to the best advantage. This could be easily and quickly done if the money was forthcoming to pay for the extra cases. The boxed specimens could also be displayed within a month if the necessary funds were provided.

While the institution has been called the "Mining Bureau," and so far has been paid for by the miners, its usefulness has been general, and the merchant, manufacturer and the agriculturist are, or should be, deeply interested in its success.



In order to manufacture to advantage, crude material must be both abundant and cheap, and, as far as possible, should be found within the State borders. It is now known that gold and silver are not the only metals in the State worthy of attention, but that other ores having an economic value are abundant. Many such instances have been made known through the agency of the State Mining Bureau. It ought not to be true that we waste enough in California to make the entire population comparatively rich.

Mr. Hanks says the Mining Bureau has grown out of all proportion to the provision made for its support, and quite beyond the expectations of its friends; but the management now finds itself in the anomalous position of being compelled to retard its progress rather than to push it forward. It has long been evident that the State Museum was becoming too extensive and valuable to be managed by a single individual. The experience of the last three years has shown that there is a great future for the institution, if properly managed, and it is well worthy of the fostering care of the State. But it has already become so extended in its scope that no person is competent to manage it without the advice and assistance of others. Under this conviction, I asked, in my last report to the Governor, "that a Board of Trustees be appointed to share the responsibility and management of the State property, leaving the State Mineralogist free to travel, to investigate and report upon new discoveries, and to conduct the scientific departments with his assistants." This was recommended by the Governor in his message, and, although no action was taken, I am still as strongly impressed with its importance as before.

It is clear to my mind that the time has come when the State Mining Bureau should be reorganized and placed on a permanent basis, or the museum closed, and the institution and office of State Mineralogist abolished. In view of these considerations, and not wishing to bear the whole responsibility, I called a meeting of prominent citizens, asking them to act with me as an advisory committee, and to whom I set forth the above stated facts. Mr. Hanks then describes the means adopted to bring about the Mining Exposition carried out during the conclave. He refers feelingly to the death of Hon. Joseph Wasson, the founder of the Bureau. The concluding paragraph of the first part of this report is as follows:

"It is the province of the State Mining Bureau to seek locations of all minerals having an economic value, to learn their quality and extent, and to place specimens in the museum for study and reference. To afford an opportunity to do this to the best advantage, the State Museum should be separated from the office of State Mineralogist, and be placed in charge of a Board of Directors or Trustees. The State Mineralogist should be ready and free to start at a few hours notice to any part of the State, to investigate any new or interesting discovery, and should make himself familiar with the condition of mines and mining. He should know by personal observation the localities of all the useful minerals in the State, and should spend most of his time in the field, collecting specimens and information; the first to enrich the museum, and the latter to be published in the annual reports."

We shall quote freely from Mr. Hank's very elaborate report on "Borax," in future issues of the PRESS.

INDIAN SYSTEM OF SIGNALING.

The Ophir Mine.

Quite a ripple of excitement has been caused this week over the contest for control of the Ophir mine. Senator Sharon and Mr. Flood both wanted to have the mine. At the election it was agreed that the stock voted should be in the name of Morrow for his party and in Flood's name for his party. The Flood party scored the first vote, and steadily piled up small blocks of stock until the stockholders' names commencing with C had been voted. Then the vote stood: Flood, 7,344⅞ shares; Morrow, 606. All the way through the Morrow party were seen to have been deceived into placing too much reliance on proxies. In three blocks out of five they would produce a proxy, but the Flood organization would squelch it by producing the stock itself and voting it, the rule being that stock took precedence of proxies. A proxy from Homer S. King & Co. for 2,655 shares was so served, and up to the close of the 2's the vote stood: Flood, 38,501½; Morrow, 2,350. Then the Morrow faction presented a solid block of 44,887½ shares, and the proxy of E. A. Richardson, which sent them to the front by a score of 48,580½ to 47,952½. The excitement was now intense, and continued so to the end of the voting, which left Flood a winner by a score of 51,570 to 49,021. The Flood men soon made up the Directors, as follows: C. L. Weller, R. H. Hollis, Cornelius O'Connor, C. H. Fish, A. K. P. Harmon, Maurice Schmitt and James H. Dobinson, the latter being the Morrow minority, and the preceding four the Flood men. It is estimated that the fight cost the participants in the neighborhood of $250,000. At Virginia City the result was celebrated by bonfires, and hailed by the miners as a victory for deep mining.

Indian Customs.

Since Major Powell took the chief position on the U. S. Geological Survey great attention has been paid to ethnology, and more particularly have the habits of the Indian tribes been studied. Major Powell himself spent several years in the Southwest studying the characteristics of the different tribes. His description of the customs of the Indians of Arizona and New Mexico, and those regions traversed by the great Colorado river, are specially interesting. Among other special features of which he has made a study is that of their sign language and system of signaling. They manage to convey to each other from long distances information of importance to them, such as the approach of an enemy, etc. We select from one of the sketches illustrating their system of "telegraphing," a scene showing two Indians signaling to each other. The sketch is quite a spirited one. We shall shortly quote a chapter on the subject of Indian signals, which will be of interest to many of our readers as showing the means adopted by the savages of spreading their news rapidly, without the mechanical appliances of civilization.

CORRESPONDENCE.

New Assay for Copper.

[Written for the MINING and SCIENTIFIC PRESS by C. H. AARON].

This new method has been in my mind for some time, but I have only lately had an opportunity of working it up.

Potassium zanthate, or zanthogenate, added to an ammoniacal solution of copper produces a voluminous, deep yellow solution, which curdles on agitation and settles very well when precipitation is complete.

These facts suggested the idea of a new volumetric assay for copper, more exact and in some respects less exacting than that of Mohr, by potassium cyanide.

Potassium zanthate is a more delicate reagent for the detection of copper than ammonia. It is equally delicate for nickel, and it seems capable of a variety of different applications in the laboratory. It is easily made, and so far as my experience with it has gone, it appears to be reasonably stable.

One advantage which this new method possesses over that by potassium cyanide, is that neither arsenic, antimony, zinc or nickel interfere. Antimony it is true is easily kept out of the solution, and in many cases is necessarily so; but even if present it does no harm. Arsenic is not so easily removed entirely. The separation of zinc (e. g. from brass), is also rather tedious, but in this method is quite needless.

To make the assay I first prepare a solution of potassium zanthate in water, of such strength that 50 c. c. or thereabout will completely precipitate 100 milligrams of copper. I then ascertain exactly how many c. c. of this are required to precipitate 100 m. gs. of copper by trial and make a note of the number.

I then dissolve one or more decigrams of the ore (according as it is rich or poor), in such a manner as to leave lead, silver, and antimony insoluble. Then, if present, I remove by filtration. To the filtrate I add ammonia in excess, and if a considerable precipitate is produced, filter again.

I have not yet ascertained exactly what metals must be removed, but one among them is probably cobalt. As, however, the copper precipitate is soluble in potassium cyanide, the separation may not be troublesome, even when cobalt is present, which is not so very often.

An easy way to remove cobalt along with iron, manganese, chromium, etc., is to boil the original solution before filtering with zinc, then filter and again dissolve the precipitated metals in the manner first indicated.

The ammoniacal solution obtained, the execution of the assay is not more tedious than that of the humid assay of silver bullion. I am using a Mohr burette, capacity 50 c.c., graduated to half c. c. So delicate is the reaction that the burette should be graduated to tenths. I propose to get Erdman's float, and graduate that, on the plan of the vernier. The only objection to using a greater quantity of copper or of ore in this assay is the large quantity of precipitate formed. If this is immaterial the solution may be titrated to one gramme of copper and a proportionate quantity of ore taken for the assay. In this case a decime solution may be used for the ending. It would also be well to have a solution of copper and a suitable pipette for verification by back test. In this way the assay may be made quite as accurate as the humid assay of silver (Gay Lussac's). For the present, however, I proceed as follows:

Charge the burette with the titrated zanthate and run it into the ammoniacal solution of copper in a conical precipitating glass, stirring *gently* with a glass rod. The blue solution soon appears green from admixture with the yellow precipitate. Gradually the yellow predominates and seems to become darker, but the green color is still visible. When the green has almost disappeared, stop the flow from the burette, stir quite gently for two or three minutes, and then allow of settling. One of the signs of approaching completion is that the solution clears with comparative facility. If the tolerably clear solution still has a distinct green tinge, run in about half or a whole c.c. of zanthate; stir and settle again, and when the green becomes doubtful proceed, quarter by quarter, adding zanthate, stirring and settling with more and more care, until the last added quarter c. c. of zantbate produces no cloud. Now stir and settle very clear; dip the end of a small glass rod into an ammoniacal solution of copper. Not a drop is required, but a film on the rod. Draw the wet end of the rod through the clear solution above the settled precipitate, holding the vessel in a good light, and if a light cloud is produced, enough of the zanthate has been used.

In adding the zanthate, toward the end, a record should be kept of each quarter c. c. and its effect. The last quarter which produced no effect, and was proved to be in excess by means of the rod wet with ammoniacal solution of copper, must not be counted. The quarter before the last must be counted as only an eighth, as a part of it was most likely in excess. Reading the burette with these deductions gives the number of c. c. of zanthate requisite to precipitate the copper in the assay. From this and the titre of the zanthate the quantity of copper in the assay is easily calculated, as in other volumetric assays. There are three indications of the approaching ending: First, the disappearance of the green color; second, the more perfect settling; third, the cessation of cloud production.

The solution may be made quite clear, but unless considerable time be allowed for the settling some flecks of the precipitate may remain suspended, and some will float on the surface. These do not interfere to any serious extent with the observations.

The reason for stirring gently instead of shaking vigorously, as in the silver assay with salt solution, is that violent agitation produces bubbles which cause floating of the precipitate.

The method is excellent for the assay of alloys of copper. I shall follow this subject up, and expect to find other uses for this valuable and little known reagent.

California a Good Mining Country.

The Mother Lode.

EDITORS PRESS:—After visiting nearly every mining district on the coast, from Alaska to Arizona, including the Territory of New Mexico, and further south into "old" Mexico, the conclusion is irresistibly forced on my mind that no one need go outside of California to mine for profit. Along the line of the great Mother lode, from Amador southward to Mariposa county, there are at different points large bodies of low-grade free-gold ores. It may take some years to educate the average mining man up to a realization of the value of this immense undeveloped wealth, but that it exists, and at the point indicated in this article, no intelligent miner who has investigated the subject can deny. The "old-timers" who came here in "'49 or spring of '50" have no conception of a large ore-body; their hobby is a small rich vein, with "more gold than quartz."

The Nevada miner is always on the look-out for "a second Comstock," a large ore body or bonanza, and wants it rich all the way through, such ones as were had in the Crown Point and Belcher, and afterwards in the Con. Virginia, California and Ophir. He turns up his nose at $5 or $6 rock, and laughs $3 rock to scorn, ignoring the fact that many companies in this section mine and mill at a cost not exceeding a dollar per ton. It may not be generally known that ore is now being mined and reduced at a profit at various points on the great Mother lode, which only pays $2.50 per ton. Of course the ore is easily obtained, and often as much as four tons to the stamp put through in twenty-four hours.

Were it not for fear of being considered as writing in the interest of some particular locality or of puffing somebody's mine, it would be easy to give proof and names abundant enough to satisfy any one. This class of mines are only now beginning to come to the front. Most all the large ore bodies spoken of lie east of the mother vein proper, sometimes running parallel with it on the hanging wall side, and then again being as far as five or six hundred feet to the eastward. These deposits will, in my poor opinion, and at no distant day, cause a revival of mining in this State to which the Black Hills and Leadville will not be a "marker." These ore deposits are composed, as a general thing, of talcose and pyriteous or mineral slates and schists, streaked and traversed in every imaginable direction, by spur veins or threads. These strata are often exceedingly rich, and the slate also carries a small amount of very bright, heavy flour gold, which is very easy to amalgamate. Some of these deposits are now being opened up. One mine of the kind in a neighboring county, after running thirty stamps some time, is now putting up an additional twenty, so it is presumable that the "stuff" (as the "old-timer" calls the ore) pays.

The large body of white quartz composing the main mother vein rarely pays. It is the stratified slate previously spoken of, and the east vein, a vein seldom as much as three feet wide running parallel with the mother lode, that carries the gold. Sometimes this "east vein" runs right alongside the great lode, only separated from it by a thin "gouge." All at once it darts off, and may run along until it gets a hundred and fifty feet or more away, perhaps sprangling out into minute threads and losing itself in the slate, or it may suddenly bend and come back again. It is not always continuous, and at best is a hard thing to trace on the surface, being "blind" as a general thing; wherever this vein is found it always pays, often going up into the hundreds in free gold.

At some places the mother lode pinches from ten or twenty feet down to a few inches. East of these pinches is a good place to look for large bodies of paying slate. Water power is generally obtainable, and by using the various improved forms of hurdy-gurdy wheels, quartz mills and hoisting machinery are run at trifling expense. It may be well to consider that most of these deposits can be quarried out; one deposit in particular known to the writer contains ore enough to run 200 stamps for twenty years without sinking a foot. The famed Black Hills mines, it will be remembered, contain considerably more slate than quartz. It is to the interest of the entire State that these large bodies of ore should be shown up. Raising wheat may be considered a safe business, but it requires more money at the present stage of the game, and is not nearly as certain of such large profits as mining the low-grade free-gold ores that lie to the east and north of the great mother vein of California. These deposits are as yet almost unknown to exist, even by people who live directly on top of them; by proper and intelligent search these deposits can be found and located, or if claimed can be bought very reasonably, as very little attention has been called to them, and there is no excitement.

CHAS. L. LANG.

Sonora, Tuolumne Co., Cal.

The Postal Telegraph.

A great multitude of bills has been brought before Congress during the few days it has been in session, but we doubt if any proposed measure is of greater or more general interest to the people of this country than the establishment of the postal telegraph, which is contemplated by several proposed enactments. We have frequently expressed our earnest approval of such an enlargement of the popular facilities for communication, and whether the matter be accomplished at this session of Congress or not, there is sure to be a general agitation of the subject, which will show the popular will and the establishment cannot be long delayed. Some argue that it is not in the power of the general government to conduct communication of this kind, but we see no reason whatever for the opinion. The postal telegraph is but the legitimate expansion of the present system of communication by mail, and certainly it is within the power and policy of the government as surely as were the various steps in the establishment of post roads and post routes, which have resulted in our splendid mail facilities. The only opposition we have seen to the measure thus far may be traced to two sources, one the interest which monopolizes telegraphic communication at present, which is of course to be expected; the other is the fear of increasing governmental patronage to such an extent that the army of office holders may be as powerful here as the army of soldiers is in some other countries. There is of course some reason to object to an increase of the amount of official patronage, but if civil service reform, which now shows some signs of gaining ground, be advanced, this danger will be lessened. And in counting up the objections to postal telegraphy one must also remember the great popular loss which results from present monopoly of telegraphic facilities.

In order that our readers may know in what forms the object is now presented to the attention of Congress we append several telegraphed abstracts of the bills proposed.

The first bill introduced was that of Senator Edmunds; and this distinguished statesman announces that he will make postal telegraphy one of his leading topics this winter. It is fortunate for the people that a gentleman of his wide experience in legislation and general ability has devoted himself to this measure. His idea is to have trunk lines connecting the capitals of the various States with the national capital as the main center, and then have lines in the States radiate from the State capitals to leading postoffices. He is opposed to the purchase of any existing lines and has had consultations with leading experts and collected a mass of figures bearing upon the actual cost of building the telegraph lines. He has also examined the latest system of putting wires under ground.

Another proposition is that of Senator Hill, of Colorado, and his bill is an elaborate scheme for the absorption of the present lines of telegraph by the United States government.

Still another project, and one which possesses especial local interest, is the bill introduced in the House by Congressman C. A. Sumner, of California.

Sumner's bill proceeds on the theory that a postal telegraph should be a part of the postoffice department, and provides for the appointment of a fourth Assistant Postmaster General, who shall be an electrician, and who shall take charge of the new service. The details of service are left to the Postmaster General. Bonds to the amount of $25,000,000, bearing three per cent. in denominations not exceeding $50, to run for thirty years but redeemable in twenty, are to be issued to construct the new lines of telegraph under the supervision of the Postmaster General. The bill provides that work shall commence at certain points in the country simultaneously. On the Pacific coast those points are Portland, Yreka, Sacramento, San Francisco, Los Angeles and San Diego, thus making a complete coast line. The whole system is to be opened fifty miles at a time, and any community desiring to connect with the lines first built may do so, and their lines, if built as required by the Postmaster General, may be accepted by him and paid for. Sumner's maximum rate on these lines is ten cents for the first ten words and five cents for each additional ten words. His maximum press rate, uniform all over the country, is twenty cents per one hundred words. In the transmission of letters, the use of stamps, the rights of correspondence, secresy, etc., the bill is similar to that of Senator Hill's. The low bond is designed to place the loan in the hands of the people of the country.

Representative Andersou of Kansas has revised his postal telegraph bill, introduced by him in the last session, and is soon to introduce it in the House. The following is an outline of the bill:

By its provisions the Postmaster-General is authorized to construct, maintain and operate three main lines of telegraph, the northern line to extend rom Ban gor, Me., to St. Paul; the central line from New York to Topeka, and the southern line from Baltimore to San Antonio. It is provided that all telegraph lines which since 1865 have been or shall be constructed by the Secretary of War, for the use of the army shall be, when no longer needed for military purposes, transferred to the Postmaster-General, to be used for postal telegraph, and be a part thereof; also, where the junction can possibly be made with the wires of any railroad or telegraph company which received a grant of public lands, or bonds or credit of the United States, the Postmaster General may use his discretion and cause the connection of postal telegraph therewith and all postal telegraph messages shall be transmitted over said wires at government rates and in a manner prescribed by law. The bill provides for the issuance by the Secretary of the Treasury of $6,000,000 of three per cent bonds, redeemable at option in ten years, to run not more than thirty years, which are to be offered for sale in open market at New York, the proceeds of sale to be applied to the construction and equipment of the postal telegraph by the Postmaster-General, who shall hold a sufficient reserve of said bonds as a surplus over the cost of construction as may be necessary to meet the interest for five years.

Thus the matter is fairly launched upon the attention of Congress and the people. We shall watch the measure with much interest and give from time to time information of its progress. It is an enterprise which should succeed forthwith.

The English Oak as a Timber Tree for California.

Distribution of its Seed by the University.

For some years past the English, German or European oak (*Quercus Robur*, var. *Pedunculata*) has been under culture on the experimental grounds of the University alongside of a large number of Eastern and other foreign oaks. Of all these, the "English" oak has shown so much the most rapid and thrifty development in this climate as to render its experimental culture in the various climatic regions of the State a matter of considerable interest, since in its native country this oak subserves most of the uses of the Eastern white oak, sharing with the ash most of the general uses of hard woods, the ash serving in lieu of the American hickories where elasticity and toughness is needed.

The rapid growth made by the European oak in the grounds at Berkeley has been noticed in the report of the College of Agriculture for 1880, page 68. During the first two seasons the growth made by this oak exceeded from two to three times that made by any other, besides throwing out many more branches, the seedlings attaining the hight of two or three feet; while the tap root was found to reach a depth of over three feet the first season. The latter circumstance explains its remarkable ability to resist drought when once established, which has also been reported from Australia. But at the same time it suggests the propriety of avoiding the transplanting of the tree from a nursery after the first year. The acorn should, if possible, be sown where the tree is to stay.

With a view to a thorough test of the adaptation of this important hard wood tree to California, a considerable supply of its fresh acorns have been lately imported. The greater portion of these have been sown in nursery beds, with a view to a general distribution of year old seedlings in 1884–5. A portion has, however, been reserved for distribution to persons desirous of testing the promise of this oak as a forest tree for California, and will be sent out in packages of a dozen acorns each on application. The acorns should be sown as soon as possible, covered with about an inch of earth. The tree thrives best on mellow soils, but has also done well on black adobe when kept mellow during the first season. In any case the soil should be one in which the tree can freely extend its tap root, upon which its resistence to drought depends; and to insure germination it is well to mulch the surface. Address applications to Prof. E. W. HILGARD, Berkeley, Cal.

University of Cal., Dec. 10th.

BIG MINING SALE.—J. W. Mackay and J. C. Flood, of the "bonanza" firm of San Francisco, have purchased for $450,000 the Quijotoa mines, which are located some 80 miles southwest of Tucson, Arizona, and were discovered last May. The purchase was made on the report of J. B. Low, W. S. Patten and Hank Smith. They report that nothing ever discovered on the Pacific Coast is equal to it outside of the Comstock. The purchasers will commence operations at once on an extensive scale, putting up the most approved machinery for developing and working ore.

SHIPPING POWDER ON THE UNION PACIFIC ROAD.—Heretofore nearly all the shipments of explosives have been made to Utah from California via the Central Pacific and Utah Central. The northern country has been compelled to haul all its high explosives used for mining purposes, from Ogden by team, the Union Pacific having refused to carry the article. Under an order recently issued at Omaha, the Union Pacific will hereafter transport, under certain established conditions, all kinds of blasting powders and explosives of which nitro-glycerine forms the basis.

MR. LOVINA, who has discovered a means of making low grade ores pay, by means of the leaching process, has gone to California to procure machinery for the purpose. The machinery will be placed in the Old Telegraph Smelting and Leaching Works, situated on the Bingham branch of the D. & R. G., which have been idle and going to waste for a long while past. The works will probably be in operation before Spring.—*Salt Lake Tribune.*

MECHANICAL PROGRESS.

Mechanical Exactness.

The practice of roughing out and then dressing by grinding, scraping, and paring to exactness must give way to that of accurate measurement and accurate tools to work to other measurements. It is evidently of little value to produce by expensive processes accurate gauges for screws, interiors, exteriors (for diameters), and scales for linear measurements, if there are not sufficiently accurate tools to work up to these gauges. Hand skill, unaided by mechanical exactness in machine tools, is not always sufficient to begin a job *ab novo* with exactness, or to carry it to completion without variation from the standard. In many instances an error multiplies itself and makes an insignificant divergence a serious fault. This may be particularly the case when the leading screw of a screw cutting lathe is faulty, and a longer screw than that of the lathe is to be cut by sections. If there is an error in the working portion of the leading screw it will reproduce itself, sometimes with aggravated quantity, until the end of the produced screw is reached, ruiniug the screw for exact work.

There has been recently started, in Hartford, Conn., a new company formed for the purpose of producing exact leading screws for lathes, racks, and pinions for longitudinal and lateral movements, and the closest gauged rules, or bars, for measurements to be applied to fine mechanical work, with or without aid of the microscope.

These results are obtained by simple mechanical contrivances, which are patented. So close is the guided action of the device that a leading screw of a screw-cutting lathe thirty-six inches long was detected as lacking in one-twentieth of an inch in the three feet of thread, and quite important variations were noticed in that length. In fact, the leading screw of a screw-cutting lathe made by one of the well known manufacturers of machine tools was so faulty in a distance of six feet that differently threaded screws could be cut by it at different portions of its length. More than this, it was discovered that a variation of one fifteen-thousandth of an inch was discovered—and rectified—which extended through only four inches in length of the screw. The result of the tests proved that in six feet of a leading screw there were three grades, only one of which was the pitch desired.

These variations in the leading screws of lathes are not uncommon, in fact there are many worse ones. No amount of judicious grinding will rectify an initial wrong in the cutting of the thread; it may reduce its irregularities, but it is impossible to move a thread bodily on its core, and whatever is ground off on one side leaves so much opportunity of backlash on the other.

It is evident that any device that can produce absolutely true threads running over inches and feet is an advance in the direction of exactness in machines, and consequently in the perfection of their productions.—*Scientific American.*

Testing Railroad Iron and Steel.

For nearly four years, says an exchange, the German railroads and iron and steel makers have been quarreliug about the specifications on the delivery of iron and steel for railroad purposes, the former carrying the requirements, determined by mechauical tests, very high, against which the latter have vigorously protested. Both parties have attempted to hold their position, not only hy elaborate reasouing, but by carefully conducted experiments. The facts which have been accummulated during the test are very valuable, and have thrown much light upon the relation between the actual duty in service and the quality as revealed by mechanical tests. The railroads insist that great tensile strength is proof of good quality, and they have attempted to gather facts to show there exists a relatiou between the figures obtained by test and the record of the material in service. Herr H. Brauns, or Dortmund, stated at a recent meeting of the German Association of Iron and Steel Makers that a careful examination of all the facts gathered by him bearing on this question had failed to bring out any such relation. He concedes that, for resistance against dead weight, against steady stress, the tensile strength of iron and steel furnished a good guide for estimating quality; but the duty which rails, tires, and axles are called upon to meet in actual service, are different in character. The German railroads demand high tensile strength and durability, judging the latter from the contraction of area. In order to show that their position is at least open to serious doubt, Herr Brauns has made an interesting series of tests, which are positive enough to satisfy his co-workers, but the railway authorities have, so far, refused to be satisfied with any such experiments. The question is one of much interest.

A SCALE OF HARDNESS FOR METALS.—Gollner describes a scale of hardness for metals in use in the laboratory of the Technical High School at Prague, composed of the following eighteen hard metallic substances, arranged in ascending order from the softest to the hardest. 1. Pure soft lead. 2. Pure tin. 3. Pure hard lead. 4. Pure annealed copper. 5. Cast fine copper. 6. Soft bearing metal (copper, 85; tin, 10; zinc, 5). 7. Cast iron (annealed). 8. Fibrous wrought iron. 9. Fine grained light gray cast iron. 10. Strengthened cast iron (melted with 10 per cent. of wrought turnings). 11. Soft ingot iron, with 0.15 per cent. carbon (will not harden). 12. Steel, with 0.45 per cent carbon (not hardened). 13. Steel, with 0.96 per cent. carbon (not hardened). 14. Crucible cast steel, hardened and tempered, blue. 15. Crucible steel, hardened and tempered violet to orange yellow. 16. Crucible steel, hardened and tempered straw yellow. 17. Hard bearing metal, copper, 83; zinc, 17. 18. Crucible steel, glass hard. The test is made by drawing a cylindrical piece with a conical point along a polished surface of the metal to be tested. In the case described, that of a bronze used for the cross head guide of a locomotive, the point, when loaded with 5 kilograms, was drawn six times through a distance of 3 centimeters. Under these conditions the points of the number below 5 in the scale were blunted without marking the surface; with Nos. 5 and 6 neither point nor surface were abraded; but No. 7, while being slightly worn on the point, began to scratch the surface. The hardness was therefore that of pure copper or soft bronze. The absolute tensile resistance was found to be 2,051.7 kilograms per square centimeter, while that of copper is 1,920 kilograms per square centimeter, and that of the bronze, No. 6 is 2,300 per square centimeter, thus showing an intimate relation between the strength and hardness of similar compounds.

BEARINGS AND FRICTION.—A bright and well known mechanic insists that on his swiftest moving journals he obtains the best results with cast iron on east iron, and he is willing also to depend on an emery-ground fit. Another, perhaps, equally authoritative, says that for exceptionally high speeds, as 4,000 revolutions per minute, cast iron on cast iron are inadmissible, but he employs untempered steel and hard Babbitt metal well hammered into the box and then bored out. He tried hardened steel boxes and soft steel spindle for that speed, and found that the boxes cut so rapidly as soon to destroy the spindle as well as the boxes. For heavy weights and large journals there appears to be nothing that gives better satisfaction than good Babbitt boxes hammered solidly. Cast iron boxes with wrought iron or steel spindles have done well where the weight and speed are not excessive. All soft metal hearings, as Babbitt or composition, ought to be protected, from the grinding influence, of dust, but east iron, if kept well oiled, soon forms a glaze that is almost indestructible. In all cases the journal should give speed enough for a film of oil, especially for high speeds under which it may become heated and slightly expanded. Many journals and boxes are injured hy binding, the consequence of a too finical fit.—*Scientific American.*

MANAGING STEAM BOILERS.—Getting up steam on a boiler or a battery of boilers, says the *Locomotive*, is thought to be a matter of no special importance in most manufacturing establishments, and when it has to be done in the night is commonly intrusted to the watchman, whose knowledge is limited to building a fire and keeping it going until an engineer gets there in the morning. This is a great mistake that has already cost many lives and thousands of dollars expenditure in repairing damages to property caused by their inexperience or recklessness. How many boilers have been injured hy watchmen under such circumstances only those familiar with such matters can tell. The *Wood-Worker* says: It is remarkable, but nevertheless true, that statistics show that over one-fourth of the boiler explosions in this country occur in saw-mills, planing mills, and other wood-working industries. Does this large percentage arise from over-work of the boilers, or the incompetency of the men in charge of them? It doubtless arises from the fact that boilers in such places are fired with shavings, or edgings and slabs, which produce a very intermittent fire, at one time exceedingly hot and at another much lower in temperature. Boilers so fired require careful watching.

LACK OF TECHNICAL EDUCATION AMONG AMERICAN MACHINISTS.—The Philadelphia *Ledger* says that a person who recently advertised for machinists tested the proficiency of all who applied, and remarked, when summing up the qualifications of the men, that though the Americans pleased him the most by their brightness, the foreign workmen were without exception better educated. The Americans had picked up their trades in the shops, but most of the foreigners, in addition to their shop practice, had attended technical schools. The latter could not only do good work with the tools, but they could lay out, make sketches, and, if necessary, draw the designs to scale. The American shop-taught workmen, though quick to understand, inventive, skilled in the use of tools, were markedly deficient in drawing and such knowledge of mechanics as is required hy the designer and draftsmen.

TEMPERING TOOLS.—A tool, after it is has been forged, should be so hardened or tempered that it will never want to come to the fire again until it is so worn down that it requires reforging. This saves the time lost in a second hardening; and it avoids the damage always done to the cutting power by rehardening without forging.

SCIENTIFIC PROGRESS.

The Latest Concerning the Glacial Period in America.

In the columns of the *Independent* for March 4, 1880, and March 10, 1881, a somewhat detailed account was given of the investigations of the Rev. G. Frederick Wright, of Andover (now professor in Oberlin), relating to the chronology of the glacial period. Since that time Mr. Wright has been busy collecting further information bearing upon the subject. In connection with Professor Lewis, of Philadelphia, he has accurately traced for the Pennsylvania Geological Survey the southern boundary of the glaciated region across the State, and during the year past, under the auspices of the Cleveland Historical Society, has followed it across Ohio and Kentucky to the Indiana line.

The southern boundary of the glaciated area of America crosses the Delaware river at Belvidere, a few miles above the mouth of the Lehigh river; thence its course is through Northampton, Monroe, Luzerne, Sullivan, Lycoming, Tioga and Potter counties, in Pennsylvania. It just touches the southwest corner of Alleghany county, N. Y., and reaches its northern limit in Cattaraugus county, a few miles north of Salamanca. Thence it turns southwest, running through Warren, Venango, Butler, Lawrence and Beaver counties, Pa., entering Ohio, in Columbiana county, a few miles north of the Ohio river. Thence its course leads through Stark and Holmes to Knox county, where it takes a sudden turn to the south through Licking, Perry, Fairfield, Rose, Highland, Adams, Brown and Clermont counties, crossing the Ohio river on the line between Campbell and Pendleton counties, Ky., and recrossing it near the southern boundary of Dearborn county, Ind.

Down to this line the whole country is covered with unmistakable signs of glacial action. Granite bowlders from the far north are numerous, both on the hilltops and in the valleys; stones of various kinds are mingled together in the unstratified clay deposits, and are striated as in the ground moraine of Switzerland. South of this line these signs disappear. In the river valleys water has often transported bowlders much further, but the action of water soon erases the peculiar marks of glaciation and leaves only stratified deposits.

This boundary line is remarkable, both for its indifference to latitude and elevation above the sea. In Monroe county, Pa., it rises 2,000 feet above the sea without being much deflected from its general course. In like manner it descends 1,500 feet to cross the Susquehanna at Beach Haven, and ascends to 2,000 feet again in Lycoming county, and continues nearly to that elevation until it approaches Ohio. Its sudden turn to the southwest in New York, and to the south in Knox county, Ohio, is not due to any change in elevation. The highest land in Ohio (about 1,900 feet) is in Logan county, north of the point where the ice is extended farthest south. The gradual descent into the valley of the Mississippi may have had something to do with the extreme southern extension, but the sharpness of the flexures in Cattaraugus county, N. Y., and Knox county, Ohio, show that the southern boundary was determined largely by the irregularity of the force pushing from behind. If, for example, snows had fallen in excess over the region of the upper lakes so that the ice was a thousand feet deeper than to the east, the effect would be to push a lobe of ice in the line of the least resistance to the southward of the ordinary boundary.

South of New England, through Cape Cod, the Elizabeth Islands, Long Island, Staten Island and across New Jersey, the southern boundary of the glaciated regions is marked by very large accumulations of glacial material, forming hills from 50 to 200 feet in hight along the whole line. West of this the terminal accumulation is not always so marked, but the boundary is everywhere sharply defined, and through a good portion of the distance the excessive marginal accumulation continues. Noteworthy points at which to observe this feature are in Pennsylvania, on Pocono Mt., Monroe county; in the valley of the Susquehanna, at Beach Haven; of Conowango creek, twelve miles north of Warren, and near French creek, a few miles west of Franklin; also in New York, south of Randolph, and in Ohio, near Canton, Stark county; Thoruville, Perry county, and Adelphia, Ross county.

The distance to which bowlders found in Ohio and Kentucky have been transported is noteworthy. Ohio is covered throughout the larger part of its territory by the nearly horizontal strata of carboniferous and devonian formations. Not only are there no native granite rocks within its borders, but none are to be found in place to the north short of the shores of Lake Huron. Yet a granite bowlder 18x12x6 feet in dimensions occurs near Lancaster, in Fairfield county, Ohio, which must have come from Northern Canada, 400 miles away, and conglomerate bowlders containing pebbles of red jasper characteristic of the hills about Lake Superior are found in Boone county, Ky. That the ice sheet of the glacial period crossed the Ohio and entered Kentucky a few miles can no longer be questioned. * * *

The effects of this extension of the ice sheets into Kentucky are very interesting. The Ohio river occupies a narrow valley about one mile wide and from 300 to 500 feet deep, cut previous to the glacial period through the horizontal strata of the coal measures. Hence the passage of the glacial ice across the channel of the river must have formed a dam from 500 to 600 feet high. This must have raised the water in the upper portion of the channel high enough to have submerged Pittsburg 250 or 300 feet deep and formed a large lake covering the junction of the Alleghany and Monongahala rivers with the Ohio. Very likely this may be the key to unlock the mystery of the extraordinary river terraces both above and below Pittsburg. We shall soon know the exact boundary of the glaciated area, and be able to study at a great number of points the streams which break through this boundary.

Differences in Tidal Action.

It will afford some notion of the various conditions which must be taken into account before anything like a complete knowledge of tidal action can be obtained, if we remember that in the open ocean the rise or fall nowhere exceeds a foot or two; while at Mount Saint Michael the rise is eighty or ninety feet; in the Bay of Fundy, particularly at Annapolis, it sometimes amounts to a hundred feet, and about the Morea there is no change at all. On our own coasts the rise varies from thirty to forty feet, at some parts of the west of England, to be nil at a point in the German ocean north of the Straits of Dover, where a flow transmitted through the straits encounters an ebb transmitted round the north of Scotland, so that an equilibrium is maintained. The actual movement due to attraction, moreover, whatever it may be, requires time for its full development, and still more time for its propagation, the latter requirements being greatest where movement is impeded by sheer friction, and thus reaching its maximum where the friction is due to the beds and winding channels of rivers, along which, consequently, the tidal elevation passes as a wave, succeeded by a flow. If it be high water at the mouth of the Thames at noon, the full flow will not reach London Bridge until midnight, by which time it will again be high at the Nore. In the meanwhile, there has been low water at the Nore and high water about half way to London; and while the high water is proceeding to London it is ebbing at this intermediate place, and is low water there when it is high water at London and at the Nore, where the river is of such magnitude as to afford a sufficient distance for the full development of the phenomena successive tides produce successively but co-existing elevations, separated by corresponding depressions; and in the River Amazon, between Para, at the mouth of the river, and the confluence of the Madeira, there are no less than seven co-existent high waters, with as many low waters between them. The same kind of thing occurs in all arms of the sea, or in all gulfs or bays which are open to the main ocean on a single aspect; the successive tides sweeping along their shores to reach different places in succession, and this at a rate of speed which is greatly determined by the sinuosities and other characters of the coast line.—*London Times.*

Constitution of Comets.

No less than seven comets have been observed during the past year, one of which was photographed by Jassen in France, Common in England, and Draper in New York. Huggins states that carbon, hydrogen, and nitrogen are undoubtedly found in the substance of comets, and oxygen also is probably present. The chemical composition of twenty comets which have been studied appears to be essentially the same. There are often certain secondary modifications, which show that the predominant conditions are not rigorously uniform, and that they may vary from day to day in each comet. The temperature, the density, the amount of gaseous matter emitted by the nucleus, undergo continual variations. It is probable that the spectrum of hydrocarbon is complicated by traces of the spectra of compounds of oxygen and carbon. Meteorites are probably of the same nature as comets, and gases can be extracted from them in such quantities as to be exhibited before an audience. In 1867 Prof. Odling, when lecturing upon the researches of Graham, lighted the lecture room with gas that a meteorite had brought from the realms of space. The meteorite was chiefly iron, and contained nearly three times its volume of gas, of which 85 per cent. was hydrogen, 5 per cent. carbonic oxide, and 10 per cent. nitrogen. Prof. A. W. Wright found in a stony meteorite gases which occupied a volume two and a half times as great as that of the meteorite, or twenty times as great as that of the iron which was dispersed in its mass. The gases were the same, but in different proportions. The idea that the light of comets and the phenomena of their tails are produced by electricity appears to be spreading. Zollner, especially, has endeavored to show that the known laws of electricity are altogether sufficient to explain cometary phenomena. It has been commonly supposed that the bright lines in cometary spectra indicate heated luminous gases. Prof. Wright and Johnstone Stoney think that the decomposed vapor is opaque, as compared with the special rays that appear like bright lines, and that the brightness is due to the reflection of the sun's rays from the vapor. Stoney regards the phenomena as one of phosphorescence.—*Annals of Chemistry and Physics.*

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CON.—*Ledger*, Dec. 15: One hundred stamps of the Plymouth Con. Co. are in operation at this writing. The mines are turning out the usual quota of gold, paying a dividend every month. The pipe to conduct water from the receiving reservoir to the works is arriving by wagon loads every day. It is made of No. 14 iron, and is 20 inches in diameter. The reservoir will be finished this week. The joints of pipe instead of being lapped over, will be joined together by iron bands, and the crevices filled with lead to prevent leakage.

SUTTER CREEK.—The outlook for Sutter creek has materially improved during the past few days, owing to the prospect of at least two idle mines being started up almost immediately. It is reported that the old Wildman mine, that has been dormant for many years, will be operated right away by San Francisco capitalists. James Morgan, in company with two capitalists from the bay, inspected the property early in the week. The mine shows good rock, but the water could not be controlled by the light machinery that was put up in early days, and this in a great measure was the cause of its being abandoned. I am pleased to state also that the Lincoln is likely to start soon. S. D. R. Stewart has secured a lease of the property for three years, and will proceed to work it at once.

At the Amador Con., 20 stamps are kept running steadily, and the working force has been somewhat increased. There have been no new developments worth noticing.

BUNKER HILL.—The Bunker Hill Co. has purchased two large boilers from the Oneida M. Co. They were hauled from the Oneida to the Bunker Hill mill last Tuesday. They are for the purpose of fixing up the mill to run by steam, so that there need be no suspension whenever the supply of water fails. The mill has been idle for weeks past in consequence of shortage of water. The ore now being worked at the Keystone is of a higher grade than for some time past.

Calaveras.

WEST POINT.—Cor. *Chronicle*, Dec. 15: Mr. Richardson has his quartz mill completed and is now crushing ore. The Scorpion mine is running; the owners have erected a new boarding house. The Wide West is still running, and taking out good ore. Mr. Geo. Eberhart has struck a rich mine and is taking out splendid rock. The old Wood House mine is running, and the owners are taking out good ore.

NOTES.—The *Citizen* of the 15th gives these items from the *Prospect* of the 8th: Ben Hughes has commenced work on what was formerly known as the Lemon claim on Tunnel ridge. This claim is said to have received its name from the fact that chispas, of about the size and shape of lemons, were at one time plentiful. The company working the Gold Cliff mine, in the vicinity of Angels, will soon commence grading for a new mill. It is thought that a 40-stamp mill will be erected. The mine known as the Bovee mine, near Angels, has shut down temporarily for repairs. The Old Reserve mine at Carson hill is reported in full blast. The 40 stamps are kept in constant action day and night. H. Howarth and Thos. Ryan are getting rich gravel from their mine at Chili junction.

MURPHY'S.—Mountain *Echo*, Dec. 12: In the Red Wing, more men have been set to work in the levels, and the production of ore will be considerably increased. The company has 37 men. The mine, mill and chlorine works are working smoothly. The one stamper still keeps up its monotonous thump on ore from the O. K. Buckhorn and other mines in the vicinity. Concentrates are being hauled from the Calaveras mine for reduction in the Oro Plata chlorine works. They are from the old tailings. The Calaveras mine is the most economically worked mine in this vicinity, and with the Burleigh drill now in operation developments are progressing finely. Experts who have been among us lately, have bonded several mines in this vicinity. There is a rumor of the starting up of the Fair Play mine and mill again.

El Dorado.

INDEPENDENCE.—*Republican*, Dec. 13: The old Independence mine, near Brownsville, that produced near $100,000 in early days and was only worked about 50 ft deep, has been bonded to some Eastern parties, and work has been commenced to open it.

The recent clean-up at the Melton mine at Grizzly flat was the largest that has been made.

SPANISH DRY DIGGINGS.—*Republican*, Dec. 15: On Monday we had a chat with W. A. Bucknam of Spanish Dry Diggings. He has great confidence that at a not far distant day some permanent and rich mines are to be opened up on the Divide. He has a contract for running the new tunnel which is to relieve the Morrell Con.

RIP VAN WINKLE.—Georgetown, Dec. 14: The Rip Van Winkle quartz mine, better known as the Jordan & Zombro mine at Slate mountain, southeast of Georgetown, has been bonded to Mr. Monkton of San Francisco for six months for $16,000. Mr. Monkton has already laid in his winter supplies, and put two shifts of men at work drifting on the lode. Messrs. Jordan & Zombro, in addition to putting down an 80 ft shaft and tapping the lode with a large tunnel below that depth, have drifted some 40 ft on the ledge, all in ore which will average $20 per ton. The ledge is some 3 ft in width.

NASHVILLE.—Cor. Amador *Ledger*, Dec. 15: At the Havilah mine, Nashville, El Dorado county, a fine body of pay ore was struck in the tunnel of the 500 level. It promises to be the boss mine of El Dorado county. At another mine, a mile or so north of Nashville, nearly $10,000 in specimens was taken out last week. Mining in that locality is having a boom.

The hoisting works building over the south shaft of the Nashville mine were destroyed by fire Friday. The building was used as a blacksmith shop and changing room. The origin of the fire was a red-hot stove pipe. Being a cold day, the miners filled up the stove with chips. Eight men were discharged on account of the accident.

Inyo.

SLATE RANGE.—*Independent*, Dec. 15: The fine new mill of the Argus M. & M. started up on its initial run last week. It met with the usual and vexatious break-down, of course—the bursting of the pumps supplying the boiler. However, the result of only 36 hours' operations with only one battery of 5 stamps was a bar of fine silver worth $2,800.

MONTEZUMA FURNACE.—On Sunday morning the new furnace of the Owens Valley M. & S. Co., at Elna, was fired up, charged and the blast turned on. Up to Monday night the results were favorable as could be desired, the yield being some 70 bars of silver lead bullion. At last the lead well blew out, shutting down operations. The delay involved may extend over two weeks or more.

THE MODOCK.—Rumors come of an important new strike in the old Modock mine, Lookout district. Supt. Fitzgerald has a strong force at work preparing for a big run of the furnaces.

ARRIVED.—A car-load of machinery for the new Maxim mill at Chrysopolis has at last arrived.

Mariposa.

MARIPOSA IMPROVEMENT COMPANY.—Cor. *Herald*, Dec. 14: In the vicinity of Hornitos, where Mr. Hulings is operating, there are many mines that will pay from $5 to $10 per ton. These mines can never be made to pay by working on a small scale, but can be made splendid investments worked as Mr. Huling's purposes, i. e. by a large mill run by water power, said mill being placed on the banks of the Merced river where there is an unlimited supply of water the year round to run at least 500 stamps, the ore from these different mines being conveyed to the mill by cars on a narrow gange railroad.

Mr. Hulings has formed the "Mariposa Improvement Co.," and his No. 9 30-stamp mill is paying handsomely on $15 rock from the Mt. Gaines mine, one of the numerous mines which this company owns; and I am satisfied that the company will be surprised at the number of $15 mines which will be developed as they progress with their work.

Mono.

JORDAN.—Bodie *Free Press*, Dec. 15: It was reported yesterday that a rich development had been made in the Levenfeldt tunnel in Jordan district, half a mile or so this side of the mouth of Mill Creek canyon. It is certain that specimens of good ore were exhibited as having been taken from the tunnel. The ore looks like Comstock stuff, and if there is enough of it the owners have a good thing.

A REAL PROSPECT.—Same of 16: The strike mentioned yesterday as having been made in the Levenfeldt tunnel was no "steamboat." A large body of ore has been uncovered, the lowest assay of which is $193 per ton. D. E. Jones and S. O. Johnson are the owners. The former owns 300 ft and the latter 1,200. The tunnel is in 427 ft, cutting the vein at a depth of 320 ft. So far as developments show, the ledge is 27 ft wide, and most of the vein matter is good ore.

MAMMOTH.—Same of 13: A reporter was informed yesterday that the men who hold a lease of the old Mammoth mine had made a rich strike, something like the pocket that gave the mine its original reputation. It is said that the new find is in the old workings, and was passed over by the late management. There are many who believe that there is good in Mammoth yet.

OLD MONO.—The *Free Press* learns that a company of San Francisco men intend to take hold of the Keith mine in Old Mono—or it may be in Keith district. Peter Tautphaus spent some money on it, and sunk a shaft about 80 ft deep, some years ago, on a vein about a foot wide. The ore was very good, some of it being worth upward of $100 per ton.

STANDARD CON.—Same of 11: Extracted and shipped to the mill 1,296 tons of ore; received 2,130 ounces of crude bullion, and shipped $10,997.60. Upraise No. 1 from south drift No. 2, 1000 level, is up 156 ft; progress 8 ft, showing 5 ft of vein, which is looking well.

BODIE CON.—During the week ending on the 8th instant there were 145 tons of ore hauled to the mill and the same amount crushed. The average assay value of the pulp was $24.45 per ton; that of the tailings was $4.90 per ton.

BULWER CON.—The North drift, 700 level, has been advanced during the week 13 ft; total length 482 ft. The ground is hard. West crosscut from south drift, 500 level, is in 470 ft, in very hard ground.

BODIE TUNNEL.—The south drift, on the 300 level, has progressed 12 ft. The north drift, on the same level, has progressed 6 ft during the past week. The mine never looked better than at the present time.

Nevada.

EMPIRE MILL.—Grass Valley *Union*, Dec. 12: The reconstructed mill of the Empire Co. works well. The concentrators used are the "Triumph" patent, a comparatively recent invention, and claimed to be superior to the "Frue," which has stood in favor as the best machine of the kind in use. These six machines take and dispose of all the tailings of the 20 stamps, whereas for the same number of stamps eight of the Frue machines would be required.

IRON MINE AT HOTALING.—Grass Valley *Union*, Dec. 15: The Iron Furnace at Hotaling has shut down on account of a scarcity of charcoal. The consumption of charcoal is about 3,000 bushels per day, which makes it necessary for a very big stock to be accumulated to keep operations going on regularly.

AJAX.—A pumping and hoisting rig, to be run by water, has been put up on the Ajax mine, in the bed of Wolf creek below the Allison Ranch mine. The old prospect shaft, which was filled up, has been cleaned out, and a small ledge of good looking quartz has been exposed.

LIVE OAK.—The Live Oak mine in the southwestern portion of the township, is bieng opened by A. W. Stoddart. The shaft is 170 ft in depth, and drifts have been run each way to distances of 62 and 26 ft. In the largest drift, stringers, that show well in gold and sulphurets, are making from the footwall into the main hanging wall ledge, and the ledge improves in appearance as the drift is extended.

WILLOW VALLEY.—Hussey and Hussey's quartz mine in Willow Valley, upon which hoisting works were recently erected, is being rapidly developed and the prospects are encouraging. The incline is down 140 ft on the ledge, and the bottom is in a three-foot body of heavy sulphureted ore that looks as though it would yield handsomely. Sinking will be continued to the depth of 240 ft before drifting is done.

YUBA TUNNEL.—*Tri-Weekly Herald*, Dec. 13: Yesterday the long tunnel which the Yuba tunnel Co. have for the past three years been engaged in driving through one of the hills on the South Yuba river, near Hoyt's old crossing, was completed. There is now an underground passage from one side of the hill to the other. It is the company's intention to turn the water of the Yuba through the tunnel and then work out the tailings down to the river bed. The river can be worked out for a long distance and it is believed will pay handsomely. In celebration of the completion of the tunnel, a fine dinner was served at the mine yesterday, at which several ladies and gentlemen of this city were present.

YOU BET.—The English Co., at You Bet, started their new hoisting works at the Uncle Sam mine last week. Drifting has been commenced. The company's cement mill will probably be running next week. The Haywards Co. are pumping out their mine preparatory to beginning operations for the winter. A force of men will be put on as soon as the mine is free from water, and the mill started up.

Placer.

THE COPPER MINE.—*Argus*, Dec. 13: The California Copper Mining Co. at Whisky diggings have let a contract for sinking the shaft 50 deeper, making a depth of 120 ft. The shaft is a two-compartment one, 4x8 ft. At the present time there is a vein of copper mundic occupying the full width of the shaft, which carries 8 per cent of black oxide of copper, which increases in quality as depth is attained. In driving a side drift stringers of black oxide of copper have been found that assay 40 per cent. The prospects of the mine are very encouraging.

IOWA HILL ITEMS.—A. Hazelroth of Grizzly flat has struck good pay. The Morning Star still continues to pay well. Most of the mines are ready for water. It is reported that H. Simons has sold his mine at Independence Hill to some Chinamen from Dutch Flat.

Plumas.

DUTCH HILL.—Greenville *Bulletin*, Dec. 12: During the past two years the Savercool brothers have been prospecting at Dutch Hill for quartz, and up to this time have found three ledges that give promise of being valuable. On Saturday the brothers were in town and took over a small prospecting mill with which they propose testing the ore from now until next spring. All three of the ledges are large, and such hand prospecting as has been done gives very fine results. Mr. Savercool said: "We intend to astonish the country next spring." From the many rich ledges that have lately been found in Plumas and Sierra counties the chances are that an era of prosperous mining is near.

Shasta.

IGO.—Cor. *Courier*, Dec. 15: W. O. Cooper has disposed of his interest in the mine and arastra to Wm. Robinson. They have just completed a run for Cal. Smith and commence to-morrow on a run of their own. E. L. Ballou's arastra is running on Manzanita ore. The mine is looking well, the several tunnels all showing good pay ore. Work is also being done on the Falls, and will be resumed soon on the Hope. Crume & Hubbard are getting out their usual grade of ore from the Pacific, and their arastra is running on the same. Wright & Ormsby keep their arastra going on fair grade ore. J. B. Strong is taking out more rich ore from his Atlantic, and will soon have out a run. Robinson & Co.'s arastra is running and the mine is looking better than ever.

MARION MINE.—Zent has 50 tons of $300 assay ore on the dump at the Marion mine, Whiskytown, and 50 tons more coming out.

LOST CONFIDENCE.—*Democrat*, Dec. 12: This morning 10 tons of ore from the Lost Confidence mine at Iron mountain was shipped in sacks to San Francisco to be worked. This ore is like sand, of a greenish color and is said to be worth from $125 to $150 a ton. A former shipment of the same kind of ore yielded $137 a ton.

Sierra.

BIG STRIKE.—*Tribune*, Dec. 13: The people o Sierra city have been greatly excited for the past few days over the discovery of a rich quartz ledge located near Deer lake, north of the Sierra Buttes peaks. The claim has been located by Messrs. Busch, Sunderhaus, Hughes and Deidesheimer. Very rich ore is exposed at points 400 ft apart on the ledge, where prospect holes were sunk. The vein varies from 3 to 7 ft in width. From authentic reports received at this office, concerning the new find, it can certainly be considered one of the most important ever made in the county. Soon after the find was made one of the owners offered a co-partner a handsome sum for his interest in the claim.

POKER FLAT.—L. D. Davis returned from Poker flat last Thursday, where he had been surveying the Sierra Phœnix quartz claim, owned by Lindsey and Southerland, of Howland flat. This ledge produces fine prospects from several points at which it has been opened during the past few years. The vein is an immense one, measuring 60 and 70 ft in width at some points. It is the intention of the present owners to sink a shaft on the ledge at once.

ROMAN.—Prominent among the promising quartz lodes in the Sierra City district is the Roman, 1 mile east of the well-known Keystone mine. The Roman ledge was first located a number of years ago by a party of Mexicans, who found the ore sufficiently rich to warrant its being packed on mules to the river, a distance of over one mile, and there work it in arastras. It is said that considerable bullion was realized from the ledge by that mode of working. It is owned by Sierra City, Downieville and San Francisco parties.

Siskiyou.

DEADWOOD.—Yreka *Union*, Dec. 13: Pyle & Co. have their arastra nearly completed and ready to run. They have a good house built over it, and expect to be able to run all winter. Schroder & Co. have their provisions laid in for the winter. Their ledge is situated on the east side of Deadwood creek, is 4 ft thick and prospects well. Tucker & Co. have shut down for the winter. All of the quartz mines on Indian creek are doing well. The Bonanza mine is yielding a large amount of rich rock and the mill is steadily grinding away.

Mr. Wm. McConnell arrived in town on Monday with 82½ ounces of gold, the result of three days work in his claim on the Klamath. This is a good clean-up for only three days running.

SISKIYOU TUNNEL.—From Mr. Jos. Dennison, who arrived from the Siskiyou tunnel on Sunday, we learn that work is progressing rapidly at both ends of the tunnel, 194 ft having been driven at the south end, and 190 ft at the north end during the last month. Only about 2,000 ft remains between the two benches to be driven, which it is expected will be completed in about five months.

NEVADA.

Washoe District.

COMBINATION SHAFT.—*Enterprise*, Dec. 15: The greater part of the new hydraulic pump is now down in the mine and set up. They are now waiting for a quantity of column to connect the 2400 and 2600 levels. This was shipped yesterday, and will be on the ground about next Monday.

YELLOW JACKET.—Owing to the sudden shrinkage of water in the Carson river consequent upon the freezing up of the mountain tributaries of that stream the mills have been obliged to hang up most of their stamps.

HALE AND NORCROSS.—The only work now being done is at sinking the winze below the 2700 level. The new hydraulic pump will be started up in a few days at the Challar-Norcross-Savage shaft.

SIERRA NEVADA.—The raise from the 2900 is being pushed up toward the 2700 level as rapidly as possible. The cutting out of an east station on the 3100 level is completed.

UNION CON.—The station to the east of the joint Sierra Nevada winze on the 3100 level was completed yesterday. The main south drift on the 3100 level is being advanced at the rate of 25 ft per week, and the main north drift at the rate of 35 to 40 ft per week.

GOULD AND CURRY.—The joint Best and Belcher winze is now about 115 ft below the 2500 level, and and is still in soft ground that is inclined to swell.

BEST AND BELCHER.—The joint Gould and Curry winze below the 2500 level is in soft vein material, with streaks of heavy black rock, that contains masses of iron pyrites. There is some water coming in at the bottom.

ALTA.—A second donkey pump was put in and the water was taken out at ten o'clock yesterday morning. The 2150 level is now drained, and they will soon resume active operations on that level.

CROWN POINT.—The Mexican mill, on the Carson river, can now only crush about 50 tons of ore per day, therefore it has been found necessary to temporarily reduce the force.

OPHIR.—A considerable amount of ore is still being found on the 150 level that will pay for extracting and milling.

IMPERIAL.—Good headway is being made in the main west drift going out to tap the old upper levels of the group of mines commanded by the Imperial shaft.

SCORPION.—The face of the west drift on the 500 level is in vein porphyry that shows frequent streaks of porphyry and seams of clay.

ANDES.—Some very fine looking quartz is being encountered in the north drift, and in the south drift is being found some ore of low grade.

CALIFORNIA.—Fair progress is being made in the sinking and timbering of the joint Con. Virginia winze below the 2700 level.

BELCHER.—Some ore is still being extracted, but the very low stage of water in the Carson river is again interfering with milling.

UTAH.—Good progress is making in the north drift on the 1750 level. It is going into ground hitherto wholly unexplored.

MEXICAN.—The principal work at present in this mine is the making of repairs to the drift and upraise on the 1600 level.

CON. VIRGINIA.—The usual progress is being made in the joint California winze on the 2700 level.

UNION SHAFT.—The easing of timbers and the making of needful repairs is still continued at the 2300 station.

OVERMAN.—Are taking out some ore from the ground in the upper levels.

Candelaria District.

MOUNT DIABLO.—*True Fissure*, Dec. 15: A north crosscut is now in 41 ft and shows 15 inches of $140 ore. Near the shaft above the first level, a south crosscut has been driving 90 ft, and shows 12 inches of $75 ore in the face. A bullion shipment was made on the 7th instant of $4,812.37, and another on the 10th of $6,525.17

COLUMBUS CON.—The drift from the bottom of the Bonanza winze, running to connect with the main shaft, has been extended about ten ft beyond the imaginary foot wall of the ledge, crossed a short time since. The ground is very favorable for working, and good headway is being made in general toward connecting the shaft with the bottom of the winze.

NORTHERN BELLE.—Eureka *Sentinal*, Dec. 14: The Northern Belle mine, Candelaria, instead of shutting down work as is reported ought to be able to pay off the recent judgement against it ($360,000) and go right ahead producing bullion. After the payment of thirty successive monthly dividends aggregating $1,450,000, the Northern Belle suspended dividends from Oct. 15, 1877, to May 15, 1880. Its product up to the last quarter of 1883 was $3,960,007. The dividends for this period have been thirty-three and have footed up $935,000. Furthermore, the surface property, consisting of large mills and a most effective reduction plant, with efficient hoisting machinery and an extensive water improvement and appliances, is particularly valuable while unquestionably the mine is not exhausted, either in its upper levels and almost untouched, as we have said, below 500 ft. The cash in the treasury, including unsold bullion, is fully $50,000. So far as we can see, there must be ample capacity in this property to pay off the judgement granted in favor of the Holmes Com-

pary, heavy as it is, with an ample margin for subsequent financial rehabilitation.

Esmeralda District.

ELNA.—Hawthorne *Herald*, Dec. 15: The 30 ton furnace has been in active and successful operation for a couple of weeks until last Wednesday, when a leak was spring in the bottom, and work stopped for repairs. It will be about the first of January before the furnace will be ready. The trial run demonstrated beyond a doubt that the smelter was a success. The company has purchased the old Montezuma mine, and are now developing it. They have sunk a shaft 300 ft, and have a tunnel in over 200 ft, which will have to be driven about 100 further to tap the ledge. There is an abundance of ore in the mine and Mr. Miller informed us that the short run just made by the smelter proved that it would pay handsomely.

AURORA The Silver Hill mill has just cleaned up after a run on New Esmeralda rock which averaged $33.50 per ton. Governor Blaisdell has had work done on the Humboldt West and that mine is looking better as the work develops the ground. The Silver Hill mill is now crushing ore from the Silver Lining, and Messrs. McKinlay & Grey intend to reduce 1,000 tons. It promises to yield them big profits. The Centennial, at the depth of 150 ft, running south on the ledge has struck it immensely rich. The ledge of this mine is 100 ft east of the Cortez.

PEACOCK.—The Peacock mine, Cory district, north of Spanish camp and 7 miles from Hawthorne, has one of the largest ledges ever developed. It is immense, averaging 50 ft in width, and the hanging-wall is well defined. The ledge is a vast deposit and is pronounced by miners to be nickel, showing a copper stain. The locators are pushing the development of this strange find and are awaiting returns of the assayer.

THE NEW BOSTON MILL.—Cor. *True Fissure*, Dec. 15: The writer has had a prolonged interview with a practical millman, L. McNeill, and his version of the matter is that the New Boston mill on its present site can never be a success. Where it now stands there is not a sufficiency of water to run on half time. The expense of laying a new main would nearly equal that of removing the mill, which would be 4 miles nearer this company's mines. By this removal the ores from the Sunrise, Tiptop and other mines could be easily taken to mill, altogether assuring a constant supply of ore. Mr. McNeill has inspected the mill, mines and spring of water, and says the water tunnel should be extended 20 or 30 ft. His estimate of the expense of removal and rebuilding to completion could more than be made up the first two months' run.

Paradise District.

PARADISE VALLEY.—*Silver State*, Dec. 14: The outlook of the Paradise mines is better by far than it ever was before. The mines which are being worked to any extent are looking remarkably well, and large bodies of high-grade ore have recently been discovered in the Paradise valley and Wild Goose. Where a year ago only the annual assessment work required by the laws of Congress was being done on mines, some 40 or 50 men are steadily employed, and the bullion product of the district, including ores shipped away for reduction, is about $25,000 per month. Since the burning of the Bullion Company's mill, a few weeks ago, there are only ten stamps crushing ore. These are at the Paradise valley mill, which produced last munth about $22,000 in bullion, and a greater yield is expected this month. In the Wild Goose there is a large lead carrying good ore as far as the mine is opened, and a large body of very rich ore was developed in one of the levels recently. It is estimated that there is sufficient ore in sight to run a ten stamp mill for six months. The Bullion, immediately adjoining the Wild Goose, has considerable ore in sight, and the company has made arrangements to open the lead 280 ft below the old works, at a point where good ore has been found. The upper level of this mine produced some $380,000 in bullion and it has not yet been worked 125 ft from the surface.

RATTLER.—The Rattler, owned by Marcott & Brannan, who are developing it by their own labor, is considered a very valuable mine, and it produces considerable high-grade ore. One car-load of it shipped to Salt Lake yielded $540 to the ton, and another shipment recently made to San Francisco was considered equally rich.

Pioche District.

COYOTE.—*Record*, Dec. 8: This new district is advancing to the front. It is in Bull valley, near Clover valley, on the line dividing Utah from Nevada, 75 miles from Pioche. Float was found in Bull valley by prospectors years ago, but where it came from could not be found. A few months ago ledges were discovered and a mining district formed, and a number of the claims taken up have opened out well. The ore carries both silver and gold, some of which is very rich.

GOLD MILL.—Dick Gillespie having purchased a gold mine in the lower end of this county is now preparing to erect a gold mill. The mine is the one discovered by John Huess some time ago, and is 18 miles south of El Dorodo canyon, and 10 miles back from the Colorado river. The assays Huess had made showed an average of over $30 in gold. Gillespie recently brought a lot of ore to the canyon and had it worked, which yielded over $130 per ton.

KINGFISHER.—Owing to great improvements made in the Kingfisher claim of Jackrabbit district during the week, the owners are greatly elated and are in hopes of opening up a large body of ore. The ore and workings prove almost to a certainty that such will be the case. The grade of ore has steadily improved as work progressed.

ARIZONA.

THE QUIJOTOA MINES.—Tucson *Citizen*, Dec. 8: Col. C. W. Tozer says: I never in Arizona, or on the coast, saw anything like it. Of course you need not put it that strong, because nobody can possibly believe it till they have seen it with their own eyes as I have. My individual opinion of the future of the property is that it will take rank among the great mines of the country; I was going to say in the world, but people abroad will dislike to believe that. The mines are 75 miles from Tucson in a westerly direction. The mines are situated on an isolated mountain, composed of porphyritic rocks, which rise abruptly from hights varying from 1,600 to 1,800 ft. Across this ledge extends the principal ore channel. It is a free milling ore, and can be worked by ordinary processes without washing. The ores are silver, carrying a small percentage of gold. From the limited amount of work done upon the mines, which work is confined to the Peer and Peerless locations, being the property recently purchased by Mr. Lyle for himself and others, I may say in general terms that the principal vein is from sixteen to twenty feet wide, and in places still wider, and never in the course of my observations in this Territory, or on the Pacific Coast, have I ever seen a more promising prospect.

RICH FIND.—The Benson *Herald*, says: Messrs. Wilson and Jackson, at a depth of four ft discovered a ledge eight ft wide, rich in free gold and silver. Mr. Jackson packed 100 pounds of the ore upon his burro and came into Tombstone and showed it to Ham Light, who had twenty-seven assays made of it, resulting in an average of $800 in silver, and $1,400 to the ton in gold. Since the results of the assays became known, about fifty men have left here and Tucson for this new district, and none of them have yet returned. It is thought that there will be from 150 to 200 men in the new camp within the next two weeks."

CONTENTION.—Prescott *Courier*, Dec. 7: The big pump at the Contention and Grand Central mines will start on the tenth. It will only require a few days to drain the mines, and the question of the character of the ore below the water level will be determined soon after.

CHICAGO MINE.—Prescott *Courier*, of Dec. 12: Another vein of rich silver ore was recently struck in the Chicago mine, six miles south of Prescott. It is fifteen inches thick and samples at the rate of $207 per ton. The gold vein, in same mine, is fifteen inches thick. Seventeen tons of it have just yielded $432 gold, with one ton of concentrates, worth between $400 and $500.

SILVER KING.—*Pinal Drill*, Dec. 8: In the Silver King Mill the boring machinery is in full operation. It is a mighty plunger that is lifted and falls with heavy weight on the rock it penetrates so as to make a twelve inch hole. They will go down into the bowels of the earth till they get where the water supply is steady and abundant.

The Jessie Bentun Mill leased to the Elmore Company at Owlhead started up on Monday last on ore of the By Chance and Lone Will mines.

GOLDEN RULE.—Tombstone *Epitaph*, Dec. 9: The mill is one of the finest ever brought to the Territory. The ore, as brought to the surface, has an average value of over $30 per ton. Every working shows ore nearly uniform in quantity and quality. Thousands of tons are blocked out for stoping, and the quantity in sight can be doubled as fast as power and drill can do the work. The daily output of the mine is producing a monthly net profit of from $20,000 to $23,000, which represents an interest of six per cent per annum on over $375,000, and with further development this output and consequent earnings can be doubled.

IDAHO.

ELKHORN.—Wood River *Times*, Dec. 5: The ore output of the Elkhorn mine the past season (from May 18 to November 27) was disposed of at the Philadelphia Co.'s smelters for the gross sum of $184,869.80, from which the net profit was $136,000. This, for a season of only 6 months, is a magnificent showing indeed for a mere "prospect."

MINEAR.—A. P. Minear left by train last night for the East, via San Francisco, taking with him some fine mining prospects, among which are four claims adjoining the Queen of the Hills mine, between this place and Bellevue, and two claims on Deer creek known as the We-met-by-chance, and the Vallejo. The four first mentioned are among the best properties on Wood river, and show ore carrying as high as $300 in silver.

GAMBRINUS LEDGE.—Idaho City *World*, Dec. 7: The Forest King ledge, in Gambrinus district, was tapped a short time ago at the depth of 200 or 300 ft. The tunnel was run in over 600 ft, and was an expensive piece of work. The rock all that distance was hard. The boys are now driving across the ledge pushing for the footwall, and have gone through 25 ft of low-grade ore, that is about as rich as the vein on the hanging-wall in the works above, the ore of which milled $35 or $40 per ton. Another vein of good ore will probably be tapped on the hanging-wall, as in the old works.

BAYHORSE.—It is the opinion of a good many that the mines of this district will surpass the Wood River bonanzas. One ledge has been discovered that is said to be 800 ft wide. Several claims on Thompson's creek have been recorded this season. Thompson's creek is a short distance above Squaw creek. There is some excitement in Custer county over the discovery of placers on "Squaw creek bottoms." A company of six men recently located claims—twenty acres each—and several claims have been taken up above these. The gold is rather coarse. They have not yet got down to bedrock, but expect to strike it rich when they do. "Squaw creek bottom" is about 30 miles this side of Challis.

BANNER.—Cor. *Statesman*, Dec. 8: The Banner mine has shut down for the season. They commenced to drop stamps July 13, 1883. The length of the run was 100 days; amount of rock run, 1,024 tons; silver produced, $107,648.83. It is seldom that a company from the East takes hold of any mining venture in the West and makes a success of it, but they have made a success of this one. They have expended for work, etc., since 1878, $250,000, but they have taken out a nice lot for it. The Banner mine will be further developed this winter by a shaft being sunk for double-decked cages at the head of the 600 ft tunnel. The mine never looked better than at present. It is estimated that there is enough ore in the stopes to keep the mill running day and night for the next three years. The Crown Point or Wolverine mines belong to this company, and will be further developed by two tunnels.

ATLANTA.—Judge J. D. Heath, the owner of the Washington mine, leaves to-day for San Francisco. The Judge has worked mines in the Atlanta district for the past 15 years. Last spring he started up to Atlanta, hired a man and commenced running a tunnel. Judge Heath is a small man, 70 years old, and will not weigh over 130 pounds. He wheeled out on a wheel-barrow every pound of rock taken from this tunnel, and prepared and helped set the timbers to timber it up. Some of the timbers he hauled down the hill with a rope, instead of using a team. They found a large vein of free gold, 6 ft wide, and are not through the vein yet. The rock will go $100 per ton, and some of it will go $1.50 a pound. Specimens which he showed us are perfectly covered with gold of the best quality, worth $20 an ounce. He has shut down work for this winter, but will come back from San Francisco early in the spring.

VIENNA.—Ketchum *Keystone*, Dec. 5: Another big strike is reported in the Vienna mine. The mine now employs 75 men. Thirty men are employed on the Mountain King mine, and 25 on the mill. Fifteen men constitute the winter force on the Solace mine. The Vienna mill continues to turn out a bar of silver daily.

TENDERFOOT.—Maj. Mensch has struck a body of sand carbonates in the Tenderfoot. The Rebble, now being worked by a few men shows an 18 inch ledge of good rock containing considerable quantities of fine ore.

Mr. J. C. Coulter, of the Philadelphia Co.'s counting room, has struck it fine on Elkhorn hill. He is interested in a bright prospect with Messrs. Greenhow and Rumsey. Samples of the ore discovered give an assay value of over 250 ounces.

CŒUR D'ALENE.—J. E. Carne writes from Fort Cœur d'Alene to the Wood River *Times*, of Dec. 8 as follows: "Don't attempt to make the mines by way of Heron siding, as that route was only reported feasible by the interested traders at that point. Rathdrum, 206 miles west of Garrison's is the only practicable route; from thence to the fort is 12 miles, a daily stage running direct to the Laketide hotel. It is going to be extremely difficult getting to the mines from the mission, as the Indians, who have the only means of transportation, are getting rich, drunk and obstreperous, consequently not to be depended upon. No one coming here before spring from Wood river need think of getting in for less than $300. In the spring one may be able to come for less."

The *Inter-Mountain* of Dec. 8th has the following: Al. Dell, of this city, is in receipt of the following letter from his partner in the Cœur d'Alene mines: "The Hays fraction is a 20 acre tract owned by Messrs. Dell, Wooden and two others. Mr. Dell is also interested in the Grub Stake and Last Chance. At present there is no way of getting into the mines but to travel on snow shoes, but the rush there in the spring will be unprecedented in the history of stampedes to gold mines in the West. The letter reads: Hays City, Idaho, Nov. 22d: Winter is upon us; the snow is a foot deep and I do not think it will go off this winter. We have no provisions in yet and I fear will be compelled to buy here at exorbitant prices. New quartz discoveries are being made constantly, and the leads promise well. All the placer ground that has yet been worked in the gulch has paid, and this is in my judgment the best camp on the American continent. Quite a number of men have bought ground here, and as high as $1,700 has been paid for a five acre tract.

The Salt Lake *Tribune* of Dec. 7th says: "Mr. B. Rolfson came in directly from the Cœur d'Alene mines yesterday. He made his way down from Eagle City to Cœur d'Alene mission—65 miles—in two days and a half. He struck the river five miles from Eagle City, and procuring an auger and ax he and his companions constructed a raft and came down the north fork on and through and under water. He is willing to make affidavit that there is no tougher journey anywhere. He reports that some 70 or 80 men came down the same way. All were as wet as drowned rats; some had lost their blankets, food—everything except their lives. Like the others Mr. Rolfson is going back in the spring, believes in the country thoroughly, and shows some beautiful nuggets as a corroborating evidence of his faith, and thinks he knows where more can be obtained. He thinks not more than 150 or 200 men will try to winter at the mines and that it is folly for anyone to try and go in there now. He believes with the disappearance of the snow plenty of quartz veins that are rich will be uncovered. The mines are only 12 miles from the British line, and the country beyond has not yet been explored. There will be plenty of room for prospecting next summer."

Two reliable experts just returned say: "The explorer leaves the Northern Pacific at Rathdrum, which is 300 miles west of where the Utah and Northern road form a junction with that road. From Rathdrum the route is by stage 12 miles to Fort Cœur d'Alene, then by steamer 60 miles is made half on the lake and half on the Cœur d'Alene river to the old Cœur d'Alene mission. The snow is already quite deep all over the country. After the snow had fallen a three days' rain succeeded, which closed in another snow storm, and the result is a trail which the hardiest mountaineers stand appalled before, for it leads through a dense forest, fallen timber, swamps and sagebrush. This underbrush is a kind of black thorn which is simply horrible to get through. To make it the more difficult all the first parties going in blazed the trees on the routes they were following; many of them lost their way and blazed the trees on the way out, and the result is hellenblazes on anyone who tries to follow their tracks. The condition of these trails makes it almost impossible for pack animals to get in, although the charge is ten cents per pound from the mission to the mines. The poor animals mire down, break their legs among the logs—many such accidents have happened—and others perish from cold and want of food. There is not a particle of food for animals on the route. It will be a serious, if not impossible thing to get anything more packed in this season. By the time the spring opens a new broad trail will be cut from the mission, via Jackass prairie. This will cross the Cœur d'Alene but twice; at one crossing there will be a bridge, at the other a ferry. It will be seen that the whole distance from the railroad is 116 miles; 60 by water and 56 by land, the last 44 of which is by a worse trail than the oldest California miner ever tried. Pritchard's gulch is 20 miles long, and from 200 to 500 yards wide, falling about two ft in 100. The slate crosses the stream at nearly right angles, and the jagged slate makes natural riffles which have caught the gold. Most of the gold is coarse, and many large nuggets have been found. On Pritchard's gulch prospects have been found for 15 miles. The gold is worth $16.50 per ounce. Eagle creek is ten miles long and from 200 to 500 yards wide. Good prospects are reported at the lower end. Beaver creek is 18 miles long. Some prospects have been found along this creek, but bedrock has not yet been found.

MONTANA.

ALICE.—In answer to an eastern stockholder's request for information in regard to the condition of the Alice, made of the New York *Engineering and Mining Journal*, we give the closing paragraph of an article in the *Inter-Mountain* of Dec. 7: The condition of the mining properties of the company is entirely satisfactory. The ore supply is abundant and reliable; the mines are worked under the direct personal management of a competent superintendent; the percentage of chlorinations and savings, or amalgation, in the mills are high and the outlook for the future is hopeful in the extreme. Of course the report that the mills are running on 150 and 200-ounce ore is rot. There is no large body of such ore in the world. The Alice company, however, has been paying off a heavy indebtedness, has labored under all the disadvantages of high freight rates, which only recently have been reduced and has been otherwise under heavy expense. The *Inter-Mountain*, however, is firmly of the belief that dividends will soon be resumed and that the Alice will be again recognized as one of the leading silver properties of the West. "Stockholder" has no occasion to be alarmed.

FISH CREEK.—*Inter-Mountain*, Dec. 10: We referred, not long since, to the fact that some placer discoveries of prominence had been made on Fish creek, some twenty miles from this city. To-day in conversation with Mr. J. W. Shields, an *Inter-Mountain* reporter gleaned the following:

The gulch is eight or ten miles in length, and has been nearly all taken up in 20-acre claims. It is four or five miles below the mouth of Highland gulch. Mr. Shields reports that he and his partner have prospected the ground at different places along the gulch and have obtained as high as one dollar to the pan. The gravel is ten ft deep and pays from the grass roots to bedrock. The gulch is admirably situated for mining, there being sufficient fall to work the ground with hydraulics. At present there are 1,000 inches of water in the creek, and this volume will be increased to 4,000 inches in the spring. Mr. Shields is confident the gulch will pay as well as any opened in the country and expresses the conviction that having talked with men who visited the Cœur d'Alene country he regards the Fish creek discovery as the most valuable of the two.

PHILIPSBURG.—Cor. of Butte *Miner*, Dec. 5: The Algonquin mill is running steadily on Trout and custom rock. Superintendent Incamp shipped five bars, the result of last week's run, to Helena, and will probably make a similar shipment during the present week. All of the ore treated so far is very low grade, barely meeting expenses. The Hope mill is fully equipped for work. About 300 tons are in the ore-house ready for the batteries, which will drop on December 1st. Frank L. Perkins, the Superintendent of the Granite mine, informs me that everything is progressing well. The Burleigh drills are doing good work in the lower tunnel, but owing to the solid and compact nature of the country rock the advance per diem is not as great as at first expected. The San Francisco tunnel is in 400 ft, with about 100 more to run to finish the contract. The face shows three and a half ft of ore, assaying from 50 to 600 ounces per ton.

NEW MEXICO.

STEEPLE ROCK.—Cor. Silver City *Enterprise*, Dec. 1: J. H. Kistler is working a full force of men on the Nugget, and upon reaching the 200 level he will commence crosscutting and drifting. The Nugget is the best developed mine in camp and is being worked on a more extensive scale than any other. Shaft No. 2, which has been sunk to a considerable depth, is about 300 ft east of the discovery shaft and like it has been sunk in good ore entirely.

Cadwell, Brown & Shehan have recently commenced work in the Rain-in-the-Face. This mine is nearly as well developed as the Nugget. They are taking out an abundance of rich ore, which contains horn and brittle silver and free gold. The owners will continue to work this and other properties in the district during the winter. The Rain-in-the-Face is attracting a great deal of attention among mining men, and will prove itself to be a big mine. The ore is free milling and in a 100 ft shaft recently sunk there was not over 3 ft of the shaft in any place but what went down in good ore. It is expected that work will soon be resumed on the Gold Note, a promising prospect west of the Nugget and upon the same ledge. Some Texas capitalists while recently doing 100 ft of work on this claim struck a large body of rich ore. At last the long looked for event has happened at the Carlisle. An abundance of water has been struck in the main shaft at a depth of 340 ft and in the future the output will be more than doubled. It is a difficult matter to get the output of this wonderful property, as it is a close corporation and they keep their business from the public. Sometime ago an item was published that a 12 day's run of from 5 to 10 stamps, according to the stage of the water, amounted to $12,000 but it has been stated that this was considerably under the real figure.

SILVER CROWN.—The largest body of lead carbonate ore ever uncovered in this section of the country was exposed on the Silver Crown claim, in Hanover gulch last week. The lead is 9 ft in width and in many places still larger. The claim is owned by H. J. Hutchinson and James C. Woodward. The property was formerly owned by the late Judge Pierson and was worked many years ago, but the main ledge was never discovered until last week. From numerous assays made by Mr. Woodward the ore is found to contain an average of 55 per cent lead and from 50 to 300 ounces in silver. The lead contained in this ore alone, is sufficient to flux the most refractory mineral to be found in this section, and as the mine is located but one mile from the Ivanhoe smelter the product will find a ready market.

HACHITA.—Deming *Tribune*, Dec. 6: B. Y. McKeyes, reports a recent find in the Apache district of a three-feet vein of high grade ore, a part of it running 380 ounces in silver and 40 per cent lead. The Dug Out boys are making a success of the adobe smelter, which they have recently got started for steady business. Two pairs of bellows furnish the blast. In thirty-six hours they run out 1,200 pounds of 300 ounce bullion and were running steadily up to the time he left. They declare themselves wholly independent of capitalists now.

For Mining Shareholders' Directory, Stock Reports, etc., see page 404.

Collecting Flue Dust, No. 5.

Fig. 16 shows the arraugement of Fig. 11 when only six sheets were used; Fig. 17, the arrangement of the same flue when 17 are used. A vacaut space is left, as C E C L in Fig. 17, to show the method of hanging in the sheets on the iron bars L, as well as the method of supporting the partitions on the bottom of the flue. In order not to impede the draft these plates must be placed parallel to its direction, and be as thin as possible. It will also be necessary to place them as nearly vertical as possible so that when the dust coudenses upon them, after it has attained a certain thickness, it will fall dowu upon the floor of the flue and remain there. Iu order to bring the quantity of dust which settles up to a maximum, the material which has once beeu condensed and brought to rest, should remain, as far as possible, where it was arrested, or if allowed to move should fall vertically on to the floor, and remain there, so tbat it would no longer he possible for it to be caught up again by the draft and be carried up the chimney.

The Simplest and Cheapest Means

Of effecting this is to make partitions, about 50 cm. high aud nearly touching the vertical sheets, across the bottom of the flue, as is sbown at E, Figs. 16 aud 17. Every five or six meters, or less, partitions are made at right angles to the direction of the draught. In the first experiments they were made of stone, laid up dry, as shown at E, Fig. 16. It has been found best, iu the more recent constructions, to make them of sheet-irou, as is sbown at E, Fig. 17. The sheet-irou is supported in wrought or cast-iron feet C, to which it is attached by bolts. It is easily set oue side when the flue is cleaned, or can he quickly removed from the supports if it is for any reasou necessary to do so. This kind of constructiou has tbe advantage of uot only being easily removed aud replaced, and of being quickly repaired, but it is never in the way. The dust collected is purer, because there is no chance of having small particles of broken stone mixed with it. This method of using plates for increasing the condensing surface costs very little, as any kind of sheet-iron can he used. By the ordinary construction one meter of the leugth of the flue gives only 8.22 square meters of surface; altered in this way, the same length gives, with six plates 65 square meters of surface, and with seveuteen, 184 square meters, while its volume is lessened only a very little.

Iu all parts of the flue where these sheet-iron plates have beeu placed,

Enormous Quantities of Dust

Have been found every time the flue bas been cleaned, the quantity being greater as the surface was larger. As uo such quantities have been found before, and as the increase in quantity is directly in the ratio of the increase of the surface, there is every reasou to believe that it will prove effectual up to a limit wbich has not yet been ascertained. The quantity of dust collected, especially in the last section of the flue, was very large. Usually, but very small quantities can with certainty be counted on in that position. It seems probable that by the use of a suitable construction, a still larger part of the dust cau be collected, and most of that which is now lost saved, tbus diminisbing the expenses and increasing the receipts of the works very considerably. With regard to the number of sheets to be introduced iu each section of the flue to produce a maximum effect, it may be said the more the better, provided they do not interfere with the draft. It has been found best to use very thiu sheets, and to concentrate them, as far as possible, in a small portion of the flue, rather than to scatter them throughout it, or over a very large part of it, as the cost of construction will for this reasou be less. Up to the end of the ninth campaign they were hung .01 m. apart. So much dust was then collected in Sectiou VI by this method that the flues became choked aud the furnace had to go out of blast. The plates can only be hung so close together at the end of the flue without endangering the length of the campaign, uuless auxiliary flues are provided, as has been suggested, so tbat the sections may be cleaned whenever desirable by turniug the gases into the auxiliary flue, aud when that is full, back again, without stopping the works. No general rule cau be given either for the number of plates nor for their relation to the width of the flue, for the quantity of gases passing through it, or the quantity of sublimed material likely to be contained in the gases. They uot only differ in the different works, but they are often different in individual parts of the same works. The use of sheets thinner than .675 mm. would give more surface for the same volume, but they would have to be supported differently, as they would be likely to be moved from side to side by the blast. If they were hung from the top there would be danger of their meeting at the bottom, aud thus obstructing the draft. To support them in more than one place would naturally increase the difficulty of using them, as well as the cost. The introduction of three or four more in the same space would largely increase the surface, but could not be done advantageously if it increased the difficulty of manipulation, or the cost at the same time. More plates would then have to be used in the length of the flue. The cause of failure, if any, in the system would be the increase of friction-surface, and this limit would have to be found in every case. Whether it will be wise to increase the section of tbe flue in order to introduce more plates can only be ascertained by experiment. When careful records of the action of each shape of flue, where the plates are used, have been made, the ledger account will soon show which form of flue it is most economical to adopt.

The Material Used for the Plates

May be different according to the temperature which obtains in that part of the flue where they are to be used. Thin sbeet-iron seems to be the best, which need uot even he new. The worn-out iron sieves of the jigs from the dressing-works can be used, and where the temperature is very low, as in the last section of the flue, next the chimney, on the hill, pasteboard can he used. Combustible material cannot, of eourse, bc used where the flue is to be fired. It would be best, however, to make experiments in each case as to what material will be most suitable.

Whether these plates can he best hung up or fixed permanently, as well as tbe best way of carrying out the rest of the system, must he determined in each special case. It will generally be found best to have them easily removable, to facilitate the firiug of the dust (which is peculiar to the works at Ems), as well as to facilitate the cleaning of the flue.

In England a patent was taken out in the year 1880 for plates which are put in horizontally. The object of this invention is to collect the dust by making the draft as slow as possible and causing the particles arrested to fall the shortest possible distance. To diminish the velocity of the gas, it is passed from the main flue into very large condensing chambers built at the side of the main flue, and divided by parallel walls into a large number of flues, in which iron plates are placed horizontally and close together the whole width of the flue, so as to make the fall of each particle as small as possible. There is no doubt that, so far as the collection of the dust is concerned, this system will do it rapidly, but the system itself is both defective and expensive. As the dust is accumulated in horizontal layers, the volume of the flue is rapidly diminished, and as there is no provision made for arrestiug the dust where it falls, the amount of surface must always be a maximum. It will take a long time for such large condensing chambers to cool down so that the men can enter them, so that much time will be lost before they can be cleaned. The danger to the men by bringing them in contact with this impalpable dust, which is set in motion every time one of these layers is removed while cleaning the flue, will effectually prevent the general introduction of this method.

Asbestus.

Occurrences.

Asbestus is found, usually in small quantities, in very many localities in this country. The great difficulty connected with the economical mining of tbis substance has been that the deposits are generally small pockets. Both hornbleude and pyroxeue asbestus occur, the former being the more commou, though it is often difficult to distinguish between these varieties. Most of the bisilicates, excepting those containing much alumina, pass into fibrous varieties, all of which are known as ashestus, though the term "amianthus" is sometimes applied to tbe finer and more silky kinds. The leading localities at which asbestus is or has been mined are Rabun and Fulton counties, Georgia; also localities in northern Georgia, western North and South Carolina, Staten Island, Long Island, and other localities in New York State, Maryland, northern New Jersey, Penusylvania and Virginia. Small quantities of good quality have also reached the market from Colorado, and the occurrence of the mineral is noted in many of the Territories.

There are very many places in California and Nevada where asbestine deposits are found. In San Bernardino county, near Agua Caliente, San Diego county; Salt Spring Valley, Calaveras county; Placer county, and at several other points in California deposits have been opened. While the mineral in some of these localities occurs in great masses and is remarkable for its length of fiber, it has generally been lacking in fineness, flexibility, or other desirable properties. For these and other reasons, such as the cost of mining and transportation and the limited local demand, the home product has not been able to compete with imported and Eastern asbestus in the San Francisco market, notwithstanding its lower price, that of the raw material varyiug from $30 to $35 per ton. Deposits of the different varieties of the mineral have beeu found at a number of other places in the Pacific States and Territories, but so few of them have ever been developed that in regard to their value or character little is known. Asbestus seems to be abundant enough in this region, but it is difficult to find it in such a form as to be acceptable to the purchasers.

Production, etc.

The production in the calendar year 1882 is estimated at 1,200 tons, of an average spot value at the mines of $30 per ton. It is expected that larger quantities will be mined in the future, and that the product can be put upon the market at a lower cost. The price at New York reaches from $15 to $60 per ton, according to purity and length and strength of fiber. The imports of crude asbestus during tbe fiscal year 1882 were 383 tons, invoiced at $14,235. The exports of manufactured asbestus were $18,923.

Relative Value of Asbestus from Different Countries.

As a rule, American asbestus is inferior in textile quality, being more brittle and harsh in fiber, as well as shorter than that imported, and is therefore not so well adapted to the manufacture of spun and woven goods. It is stated that the quality of the domestic is constantly improving, new sorts being found almost every month. There appears to be little difference between the domestic and foreign in point of fireproof qualities, though some manufacturers report as a general thing the domestic ashestus will stand a higher degree of heat. The American is better adapted for making fireproof cements and paints, for which purposes it is generally used, length of fiber being unessential. The greater part of the imported mineral comes from the province of Quebec, Canada. The Canadian asbestus sells in New York at from $25 to $90 per ton, the usual range being between $40 and $75. The Canadian is said to be the best for general use. Asbestus is also brought from Italy and Austria. A little exceptionally fine Italian asbestus bas sold as high as $250 per ton, though the price is usually about $100. The Italian is the finest for textile purposes, but on account of its higher price it cannot compete with either the Canadian or the domestic.

Ashestus is used in making liquid and fireproof paints, roofing, piston packing, valve packing, flat packing, covering steam pipes and boilers, fireproof cements, sheet and roll millboard, flooring, felt, etc. It is often used in combination with hair felts and other substances.—*Williams' Mineral Resources.*

Lithographic Stone and Lithographs.

A California Quarry.

The reported discovery in this State of a ledge or quarry of the peculiar stone used by lithographers has drawn some attention to this subject, both from an artistic and husiuess standpoint, and we condense the following from an article in the *Call*, in relation to the matter.

The best stones employed in lithography are slabs of a light colored, slaty, argillacious limestone, found in very extensive beds at Solenhofeu, near Poppenheim, Bavaria, on the Danube. These were the first and only ones used by Senefelder, the discoverer of the art. The rock belongs to the upper oolite, and occurs in sbeets and slabs of various thicknesses. It is exceedingly fine graiued, formed evidently of the finest sediments; its fossils are, many of them, of the most delicate character, amoug them being found insects intermixed with other animal remains of a marine class. Other countries have also furnished lithographic stones, as those from cretaceous formation of Belbeze, Haut-Garonne, in the French Pyrenees, claimed by some to he barder and better than the Bavarian; but the jury of the Freuch Exposition in 1855 set this claim at rest, as well as those from Algeria, Italy, Portugal France and Canada, by awarding the superiority in the aggregate of good qualities to the Bavariau stone. Until within a very short time no discovery of lithographic stone had been made in the United States.

The Lithographic Art

Was introduced into America in 1821, and was first practiced by Messrs. Barnett and Doolittle in New York.

All the stones used in this country are brought from Germany, and to give some idea of the importance of the trade it may he stated that the importation is at the rate of thirteen and three-quarter tons per day, the valuc of the same for the year being $4,892,430. On an average 13,100 cubic yards of this stoue are quarried annually in Bavaria at a cost of $1,000,000; the returns reach $10,000,000. The large proportiou of this product taken by the United States shows how generally litography is used in this country.

The Reported California Quarry

Is in Kern county, about six miles from Tehachapi Pass, on the crossing of the Southern Pacific railroad, where the surface of the country is level, and the route from the railroad to the quarry good. According to the representations of the discoverers of this valuable material, the formation passes through the mountain on the south side of the ravine, which cuts it, and the stone appears again on the north side showing a ledge half a mile in extent, and of considerable thickness, judging from the croppings. There are, however, as yet, no developments in depth. As in the Solenhofen mines, there are two qualities and shades of color in the stone found in Kern county, and those in this city who fully understand the business of lithography, including all our engravers, are quite sanguine that we have a stone quite as valuable for eugraving purposes as the German. This is an important fact. The quarries in Bavaria are said to be rapidly giving out, and till this discovery in California, no true lithographic stone had been found in the United States. In Kentucky and Canada, quarries of impure brittle stoue, resembling the German in character, have been found, but test proved it valueless for engraving purposes, and it therefore has comparatively little value. San Francisco, alone, uses $6,000 worth of lithographic stone, annually, all, of course, imported from Germany, although, according to Mr. Edward Bosqui, the well known lithographer of this city, from whom many of these facts are derived, the Solenhofen stone is gradually deteriorating as the quarries are being deepened.

The Lithographic Engravers

In the large Eastern cities, particularly New York, Cincinnati and Buffalo, where the principal show-bill printing is done, have of late built up very profitable businesses; though, occasionally they meet with a set-back from not being able to procure a sufficient quantity of stone for their work. The Strohridge Compauy of Cincinnati, is a remarkable instance of winning success against adverse circumstances. Strobridge himself is not a practical lithographer, and the fate of his venture was for a time uncertain. Finally, A. A. Stewart, who used to be a curio purveyor for Barnum, took hold, and brought a good deal of hard sense to bear on the matter. He opened an office in Twenty-third street, New York, and so exerted himself that the Strohridge Lithographic Company is now a big concern. Stewart receives ten per cent of the gross proceeeds of the business, and last year his income from this source amounted to $33,000. The Strobridge Company has been thriving for ahout four years. The *Courier* Company, of Buffalo, is also another flourishing lithographic concern. Wide as the practice of the art is in the United States, it still appears to he growing, as we notice that the Strobridge Compauy have lately been compelled to procure artists from Loudon, bringing their families as well. These artists are paid a tidy salary of nearly $10,000 a year, and would not leave home till that amount was deposited to their credit in a London hank as a guarantee of good faith. Thomas, of New York, is another leading establishment, the specialty of whicb, as of a great many other lithographers in that city, is fine insurance work.

When you admire the handsome chromo-lithograph of the scenes of a play, that meets your eye on the wall, you may as well know that it takes thirty-six stones to make a nine-sheet bill, (the size generally used) and the cost of each stone is about $75. The most perfect stones are required for crayon drawings. The famous designer, Matt Morgau, is considered the best artist for theatrical work in the United States; but of late years he does little more than superintend and direct a corps of artists under his control. The price paid for show-bill work is eight, nine and ten cents a sheet of 28x42; but at this rate the order must be for a number of copies, say two thousand and upward. The cost of lithographing is less thau one-third that of copper plate engraving, and 80,000 impressions may be taken from a coarsely drawn stone without deterioration.

In the usual practice of the art, the lines which receive the ink are composed of a greasy substance. This is applied with a pen, crayon, or a brush to the stone. The inky material is then washed with a weak acid solution, which has the effect of hardening it, and also cating away slightly the stone not protected by the ink. Water is then applied which wets the clean portiou of the stone, leaving the greasy lines dry; and after this the lithographic ink, made of old lard, white soap, white wax, shellac, mastic, Venetian turpentine, carbonate of soda and pulverized Paris black, laid over the whole, adheres only to the greasy lines. Chromolithography —so much used by traveling theatrical companies—was invented by Engelman of Paris, and is simply the printing of colors by the use of a succession of blocks, each having a single color, distributed in appropriate places. Lithographic blocks are about four inches and a half high, and are gradually worn thinner, as a new surface is made by rubbing off the old for a new drawing.

Recent Contributions to the California State Mining Bureau.

[Furnished for publication in the MINING AND SCIENTIFIC PRESS by HENRY G. HANES, State Mineralogist.]

5122. Volcanic Rock (Basalt) 5 varieties—Manna Valley, Oahu, Sandwich Islands.
5123. Basalt with Olivine—Manna Valley, Oahu, Sandwich Islands.
5124. Silver-Lead Ore—Dean Richmond mine, Tombstone, Pima county, Arizona. J. G. Manning.

Sulphur.

Occurrences.

Native sulphur is found in Nevada, California, Utah, Virginia, Louisana, and other portions of the country, occurring in beds of considerable size in Uintah County, Wyoming, near Evanston, where it is said to be quite pure; and also in some quantity in the Yellowstone Park, Montana, and in various localities in New Mexico. Sulphur springs are of common occurrence throughout the Rocky Mountain region.

Production.

Sulphur is only worked to any extent in California and Nevada, and not on a very large scale in these States. In the census of 1880 the whole production of the United States for that year, 1,200,000 pounds, worth $21,000, is credited to Nevada.

Sulphuric Acid.

In the census year 308,765,432 pounds of sulphuric acid, worth $3,661,876, were made, by far the greatest proportion of which was made from Sicilian sulphur, with a little from pyrites. New Jersey and Pennsylvania lead in manufacture of sulphuric acid, followed closely by Maryland, New York and Ohio. Sulphuric acid is made in almost every State to a greater or less extent. It is certain that the manufacture of sulphuric acid from pyrites for making superphosphates will become a very important industry in the Southern States, while the use of pyrites in works in the neighborhood of New York City is steadily increasing. It is thought by some persons that in time all or nearly all of the sulphuric acid made in this country will be manufactured from pyrites, and that acid made by burning brimstone will not be able to compete with that produced from the cheaper source, at least in the market for common commercial acid.

Foreign Sulphur.

Nearly all of the imported sulphur comes from Sicily. A small quantity has been sent from Japan by way of sample and perhaps 1,000 tons of sulphur recovered from the waste of chemical works in England are imported annually. Dealers report that as yet the Nevada sulphur has not been able to compete in price with the foreign in the market of the Eastern States on account of the high cost of transportation, which, in the case of Sicilian sulphur, is comparatively a small item, as the mineral is often brought as ballast in vessels carrying cargoes of lighter goods. The price of domestic sulphur in San Francisco is about the same as that of Sicily brimstone of the same quality laid down in New York. American sulphur appears to be irregular in point of quality. Some samples handled by Messrs. M. Kalbfleisch & Sons, New York, are stated by them to have been fully equal, if not superior, to the Sicilian, while on the other hand some of the refiners who prepare sulphur for pharmaceutical purposes report that the domestic sulphur sometimes contains traces of arsenic, which would render it unfit for this special use. The price of Sicilian per ton of 2,240 pounds at the close of 1882 was $27.50 for best unmixed seconds, and $26 for best thirds. The price fluctuates considerably, and has declined from the rates ruling earlier in 1882.

The following tables show the extent of the foreign trade during recent years:

CRUDE SULPHUR OR BRIMSTONE IMPORTED INTO THE UNITED STATES DURING THE FISCAL YEARS SPECIFIED—SPECIE VALUES.

[Free of duty.]

Years.	Tons.	Value.
1872	27,556	$765,024
1873	45,340	1,300,626
1874	41,539	1,260,140
1875	39,584	1,255,100
1876	48,966	1,473,678

—*Williams' Mineral Resources.*

A SWEET potato raised in the Santa Ana Valley, Los Angeles County, is three feet four inches in circumference and weighs 34½ pounds.

USEFUL INFORMATION.

Quick Growing Trees for Fuel.

Many located on prairie farms plant hickory, walnut, hard maple and white oak trees with the expectation of providing fuel to use in a near future. Unless they reach very old age, the prospect of their ever sitting round fires built of wood obtained from trees of their own planting is very poor. The trees spoken of produce excellent wood for fuel, and it is advisable to plant them if one designs to produce fuel for another generation. The trees grow very slowly, however, even when the soil and location are well adapted to them. Admitting that the wood of these trees is worth twice as much as that of trees that make a rapid growth, it is advisable after all to plant the latter. Few people are aware of the great difference in the increase of size of the hard and soft wood trees. If they would set a hard maple and a gray willow within a few rods of each other they would in a few years find the latter fully twenty times larger than the former. No variety of willow furnishes wood of very good quality, but several of them produce a large amount in a very short time. The trees are propagated from roots or cuttings and require little care. The wood has a few advantages. It is easy to cut, seasons quickly and kindles readily. It makes a fair fuel for cooking purposes. It also makes a good charcoal, which is excellent for light fuel as well as for many other domestic purposes.—*Chicago Times.*

OUR RUBBER INDUSTRY.—The rubber industry of the United States has little rivalry in foreign countries. There is something like $75,000,000 invested in the business of manufacturing rubber goods, $30,000,000 of which is confined to the rubber boot and shoe industry. The total number of employees is placed at 15,000, and the total number of factories at 120. According to a recent census bulletin, the value of the annual product is $250,000,000. Some 30,000 tons of raw rubber are imported every year, which, when combined with other materials in manufacturing, amount to 300,000 tons. The market price of the raw material has been forced up to $1.25 per pound, while six years ago the price was scarcely fifty cents. In consequence of the advanced price of rubber, several substances have been prepared as substitutes for it, of which celluloid is the most important.

THE APPETITE OF A BIRD IS WONDERFUL.—If a man could eat as much in proportion he would consume a whole round of beef for his dinner. The redbreast is a most voracious bird. It has been calculated that to keep a redbreast up to its normal weight an amount of animal food is required daily, equal to an earthworm fourteen feet in length. Taking a man of average weight, and measuring bulk for bulk with the redbreast, I tried to calculate how much food he would consume in twenty-four hours if he ate as much in proportion as the bird. Assuming a sausage nine inches in circumference to be a fair equivalent of the earthworm, I find that the man would have to eat sixty-seven feet of such sausage in every twenty-four hours. I mention this in order to illustrate the amount of work which is done by insect-eating birds.—*Prof. Wood*

THE HONEY BEE has long been a type of the industrious worker, but there are few people who know how much labor the sweet hoard of the hive represents. Each head of clover contains about sixty distinct flower tubes, each of which contains a portion of sugar not exceeding the five-hundredth part of a grain. Some apiarian enthusiast, who has watched their movements, concludes that the proboscis of the bee must therefore be inserted into five hundred clover tubes before one grain of sugar can be obtained. There are 7,000 grains in a pound, and as honey contains three-fourths of its weight of dry sugar, each pound of honey represents 2,500,000 clover buds sucked by bees.

GILDING LEATHER.—The following method is given for gilding leather: It is first moistened with a sponge, then stretched and tacked on a board. When dry it receives a coat of thick isinglass solution, then one of white of egg that has been beaten and allowed to settle. Upon this is laid lightly with a brush sheets of silver foil, which are then pressed down with a wad of cotton wool. When this is dry it is painted over with yellow leather varnish, which gives it a beautiful golden appearance. A varnish for bronze boots and slippers is made by dissolving aniline red in shellac or other varnish.

TO RENDER SACKCLOTH IMPERVIOUS TO WATER.—Sackcloth or canvas can be made perfectly impervious to moisture, equal to leather, by steeping it in a decoction of one pound of oak bark with fourteen pounds of boiling water. The cloth has to soak twenty-four hours, when it is taken out, passed through running water, and hung up to dry. This quantity is sufficient for eight yards of stuff. The flax and hemp fibers in absorbing the tannin, are at the same time better fitted to resist wear.

REMEDY FOR LEAKY PENS.—A correspondent of the *Scientific American* says: The stylographic pen is a great convenience, but no inventor seems to have succeeded thus far in making a joint which will prevent soiling the fingers with ink. A remedy for this leakage, which has been tried and thus far seems to be complete, is to rub the joint on which the fingers rest with the thin edge of a piece of wax. Hold the pen over a candle, lamp, or the flame of a match till the wax melts, when it will lute the joint so that no ink can escape through it.

PRESERVING AUTUMN LEAVES.—The leaves may be preserved between sheets of blotting paper, which should be changed at intervals until the leaves are thoroughly dried, in order to prevent rotting. The colors then look dull, but may be wrought out by either oil or thin varnish or wax. The leaves may also be rubbed with wax and carefully pressed with a warm—not hot—flat iron. By carefully rubbing with the edge of the iron they may be made to curl in a very natural manner.

TO POLISH EBONY.—To put a high polish on ebony, one that will be durable, give the work two coates of fine copal varnish, and rub this down, when quite dry, smooth with fine pumice stone; put on a third coat of the same, and rub down with rotten-stone; clean and put on a flowing coat of best spirit copal varnish, and when this has become quite dry, polish with chamois skin and the palm of the hand.

SEWING MACHINE POWER.—An ingenious English manufacturer has, by a simple and workable invention of coiled spring, succeeded in dispensing with the need of driving sewing machines by hand or foot. A few turns of a handle winds up sufficient power to keep a machine going at full speed over an hour. It is completely under control as to the rate of stitching and stopping, and can be applied to any existing machine at moderate cost.

A GOOD CEMENT.—Persons who use brass letters on glass windows or doors are often troubled by the dropping off, from unequal expansion, or from too violent efforts on the part of window cleaners. The following is said to be a sure cement. It should be mixed just before using: Litharge, two parts; white lead, one part; boiled linseed oil, three parts; gum copal, one part.

ANKLE GUARD FOR INTERFERING HORSES.—The cheapest and best ankle guard for interfering horses is made of ¾-inch new thin rubber hose. Get the length around the ankle (not a tight measure), cut the hose accordingly, and run inside a strap and buckle. Thus for a few cents you get a boot as good as one for which a dealer would charge $1.50.

SPIDER SILK.—French silk manufacturers are reported to be very hopeful as to the capabilities of a big spider lately discovered in Africa, which weaves a yellow web of great strength and elasticity.

GOOD HEALTH.

Trained Nurses.

We find in the last number of the *Medico Literary Journal*, published in this city, an article on the subject of trained nurses. The matter is a most important one, and should more fully engage the attention of medical men and the public generally. We believe some attention is already being given to the matter in this city—but the effort thus far has been a comparatively feeble one, and is not seconded as it should be by those most interested.

We learn from the article above alluded to, that at the recent meeting of the American Medical Association, at Cleveland, Ohio, Dr. S. D. Gross, a well-known physician of Philadelphia, offered and the association adopted the following preamble and resolutions:

"WHEREAS, Good nursing is of paramount importance to the comfort of the sick and the restoration of their health; and,

"WHEREAS, The subject is one which strongly addresses itself to the common sense and kindly sympathy of every intelligent member of society; therefore,

"*Resolved*, That this association, fully recognizing the importance of the subject, respectfully recommend the establishment at every county town in our States and Territories, of schools or societies for the efficient training of nurses, male and female, by lectures and practical instruction, to be given by competent medical men, members, if possible, of county societies, either gratuitously or at such reasonable rates as shall not debar the poor from availing themselves of their benefit."

This action of the association, prompted by Dr. Gross, has attracted the attention and received the approval of several of the more influential medical journals, and is of sufficient importance to engage the attention of the profession generally. In several of our largest cities there are already regular training schools for nurses, in connection with permanent hospitals, in which all the advantages are afforded for making accomplished and reliable nurses. But the benefits of such organized and thorough training schools, etc., in the nature of things, must be limited to the larger cities. To secure the better training of nurses for the towns and country districts, where they are even more necessary than in the cities, on account of the longer time between the visits of the physician, Dr. Gross has published an article in the *Medical News* of September 15th, from which we extract as follows:

"To educate nurses for the rural districts and villages, all that is necessary is to establish a central office or bureau at every county town in each State and Territory, and to place it under the charge of its medical society, which should elect two, or at most three of its members, to give the necessary instruction.

"Where no county society exists, the same object may be attained by the banding together of any two or three physicians in the place. Notice of the time and place of meeting should of course be given in the public prints, and also by card. A small matriculation fee should be charged, and also, where possible, a small fee for each of the instructors, to assist in defraying expenses. The teaching should be as practical as possible—essentially practical—each pupil being obliged to perform her work in the presence of her instructor, not once or twice, but again and again. There should be frequent examinations, and at the final one a certificate of competency should be awarded to the successful candidates.

"If the plan suggested be faithfully carried out, as I confidently believe it may be, either as here presented or with such modifications, changes, or alterations as circumstances may render necessary, it cannot fail to be instrumental in saving many lives, in preventing much suffering, in inspiring hope in the sick, and in imparting confidence to the professional attendant. If this plan succeed, I shall feel that I have accomplished the greatest work of my life."

HOW TO FALL ASLEEP.—I had often noticed that when engaged in deep thought, particularly at night, there seemed to be something like a compression of the eyelids, the upper ones especially, and the eyes themselves were apparently turned upward, as if looking in that direction. This invariably occurred, and the moment that, by an effort, I arrested the course of thought and freed the mind from the subject with which it was engaged, the eyes assumed their normal position, and the compression of the eyelids ceased. Now it occurred to me one night that I would not allow the eyes to turn upward, but keep them bent determinedly in the opposite position, as if looking down; and having done so for some time, I found that the mind did not revert to the thoughts with which it had been occupied, and I soon fell asleep. I tried the plan again with the same result; and after an experience of two years, I can safely say that, unless when something especially annoying or worrying occurred, I have always been able to go to sleep very shortly after retiring to rest. There may occasionally be some difficulty in keeping the eyes in the position that I have described, but a determined effort to do so is all that is required, and I am certain that if kept in the down-looking position it will be found that composure and sleep will be the result. It may be said that as the continued effort to keep the eyeballs in a certain position so diverts the attention as to free the mind from the disagreeable subject with which it has been engaged, sleep will follow as a natural consequence. It is not improbable that this is to some extent correct; and if so, it is well that by means so simple and so easily adopted, such a desirable result can be secured. But I think this is not the only nor the principal reason. The position in which the eyes should be kept is the natural one; they are at ease in it, and when there is no compression of the lids or knitting of the brows, the muscles connected with and surrounding the eyes are relaxed. This condition is much more favorable for sleep than for mental activity or deep thought.—*Chambers' Journal.*

THE TEETH.—Dr. Franzius finds that the tooth most often affected by decay is the third molar, such cases forming one-half of the total number. The teeth begin to decay in a certain successive order, the lower third molar being first attacked, then the upper, then the lower fourth molar, and so on, the incisors and the canine teeth of the lower jaw being the last reached. The upper teeth are more durable than the lower, in the proportion of three to two. The right teeth show a greater vitality than the left. The durability of teeth is less in light persons than in dark, and less in tall than in short persons. These results were obtained by an examination of 650 Russian soldiers, of whom 258 had unsound teeth.

MIDDAY NAP.—To a person of weak organization a little sleep in the middle of the day is beneficial. If taken after dinner it should not follow the meal immediately. It were better to adopt a late dinner hour—say three o'clock—and take the nap before eating. A debilitated nervous system will generally be benefited by such a practice.

NEURALGIA TREATED BY THE TUNING FORK.—Dr. Rasori applies the tuning fork, while vibrating, over the course of the painful nerve. The sitting usually lasts about half an hour, and the patient is generally relieved without further treatment. He records his method in the *Cinn. Lan. and Clin.*

THE BREATH.—A man breathes about twenty times in a minute, or 1,200 times in an hour. He breathes about eighteen pints of air in a minute, or upwards of seven hogshead a day.

Passing Events.

Although it seems somewhat early for the PRESS to wish its patrons a "Merry Christmas," the holiday will be past before it greets them again. Therefore we extend the "compliments of the season" on this occasion, and hope that the year has been as good to them in prosperity as it has to the PRESS.

The gathering of the clouds and the cessation of the frosts show the much needed rains will probably soon spread over the State.

There is little of an important nature concerning the mining industry other than we have summarized elsewhere in these columns. Active prospecting in the deep mines of Nevada continues, but honanzas still seem coy. The Coeur d'Alene mines are ice-locked, and will be for months to come; but in the spring the mountains in that part of Idaho will be overrun with prospectors.

COPPER.—The latest Liverpool quotations for copper are: Ore of 25%, 11s. 3d. to 11s. 6d., and Chili regulus, 11s. 9d. to 16s. per unit. Prices have fallen there somewhat, and dullness in trade seems to keep down every chance for an advance. Arrivals for the United States have been much less, and James Lewis & Son's report states that the shipments from here will be on a much reduced scale for some time to come. The consumption in England and France and export from England to December 1st, is about 8,500 tons now more than last year. Last month 2,700 tons came from Chili, and 3,936 tons from other countries. The total visible supply is 49,164 tons fine. The total arrivals of copper from January 1st to December 1st, inclusive, of pyrites, equals 84,718 tons fine. Chili exports for 1883 aggregate 43,376 tons fine.

Title to Mining Ground.

It has often been urged as a point against the mining industry that titles were generally unsettled; that when a man bought a mine he very often bought a law suit that would cost more than the mine would produce; that even after years of peaceable possession, some claim would be sprung if the mine proved rich. While this charge has not been wholly true, it is not without some foundation. It has been due, however, largely to the fact that the mines have been mainly in new regions where property lines were not accurately drawn and changes liable to occur. This feature is rapidly disappearing, however, and the government is more careful in granting and maintaining titles.

There was formerly a certain liberality prevailing in the Interior Department in reopening cases after they had been decided, but of late years a more conservative rule has been adopted in such matters. The Supreme Court, as well as the Circuit Courts of the United States, has laid down principles and requirements as conditions precedent to granting a device to set aside patents issued by the Land Department, which have been combined as an expression of views by the courts to the effect that the officers and departments of the United States government should not, without very good and sufficient reasons, institute proceedings to set aside a patent.

A case in point has just occurred, but the applicants have been very promptly "snubbed" by the Secretary of the Interior. It was one of those too frequent efforts to disturb the possession of the property which had been held by the original locator and his assigns for a number of years.

The patent to the property referred to was issued in the early part of 1879. Before a patent was issued a hearing was had, at the instance of citizens of Leadville, to determine the character of the land involved, it having been alleged to be non-mineral. Testimony was taken, and full opportunity was afforded to present all the facts pro and con involved in the application for location of the claim under the placer mining law, before the local office in Leadville, and to be heard by the General Land Office and the Secretary of the Interior. Parties claiming interests adverse to the claimants had an opportunity to file an adverse claim, and have their rights determined in court. The Commissioner, on the evidence so taken at that time, decided that the application should be allowed, giving at length his reasons for this conclusion; and, on the appeal of the case to the Secretary, the decision of the Commissioner was affirmed. Here was a deliberate adjudication by the Secretary of the Interior after a most careful and thorough investigation of the facts and the law in the case.

But after all this an attorney for certain citizens of Leadville asked permission to bring suit in the name of the U. S. to vacate the placer mining patents. The Commissioner of the Land Office referred the matter to the Secretary of the Interior, and both of them agreed there was no justification for the step. The Secretary says these people now set up substantially the same circumstances and allegations, both of law and fact, which were considered before the issuing of the patent, and seem to think there never is a time when litigation should end, and vested rights be settled beyond recall.

The following conclusions of the Secretary of the Interior will be heartily indorsed by the mining community: "If I were convinced that the patent to Starr and others was issued upon false and fraudulent evidence, so introduced, without opportunity for proper examination or rebuttal, as to necessarily affect the judgment of the officers of the department, I would feel it my duty, unless innocent purchasers had acquired possession of the property, to request the Attorney-General to institute the appropriate proceedings; but mere general allegations of fraud and misrepresentation will not suffice, and to deliberately decide, in effect, in the absence of such proof of fraud, that my predecessor, and the officers under him, reached an erroneous conclusion, is to invite not only want of respect for the adjudications of this office and the dependent patents, but endless litigation. It is obvious that if such a course were to be adopted, titles in the western country would be of little value, and the growth of communities upon the public lands would be retarded or stopped altogether."

Humid Metallurgy of Copper.

Every wet method of working copper consists of two principal operations: First, the separation of the copper by solution from the other ingredients of the ore or mixture; second, the separation of the copper in the solution from any other substance held in solution, by precipitating it as metal, as oxide, or otherwise. All wet methods are grouped into two principal classes: First, those in which the fresh solvent has to be used for the extraction of copper from each successive change; second, those in which the solvent is renewed or regulated in one of the later stages of the operation. Local conditions at any given locality, such as cost of fuel, etc., as well as character of the ore and its contents, must determine whether a dry or wet method should be selected. In any case the presence of a considerable quantity of lime, magnesia, or other constituents in the ore, which, by consuming the solvent, occasions its waste, would prevent success with wet processes.

Mr. James Douglas, Jr., a gentleman of much experience in this line, states that humid methods are adopted for extracting copper from its ores.

1. When the quantity of copper present is too small to admit of the application of a furnace method. The reagents consumed in dissolving copper from its associated minerals are generally in proportion to the absolute quantity of copper present, and consequently when the copper contents are low, the quantity and cost of the necessary solvents are proportionately reduced in case the non-cupriferous ingredients are inert and unacted on, otherwise the fuel, which is the principal reagent in all smelting methods, has to dispose of and alter the constituents of not only the copper but likewise the gangue.

2. When the ore contains injurious elements which cannot be eliminated in the smelting furnace, as for instance, arsenic and antimony.

3. When the copper is associated with other metals, economically valuable, which, if all were smelted together, would pass into valueless combination. For instance, the pyriton ores of Spain, after their sulphur has been roasted off, might be smelted, but by so doing the silver would enter the copper and be lost, and the iron would enter the slag and become valueless.

Fluxes in Lead Smelting.

The fluxes most frequently used in working lead-bearing ores are quartz, sandstone, clay, slate and other highly silicious rocks to supply any deficiency of silica that might be required to saturate the basic gangue in an ore; hematite, magnetite, limonite and specular iron ore, and the various manganese ores, if iron is lacking in an ore; limestone, dolomite and calcareous shale, if calux oxide is not in sufficient quantity in ore to form a slag of the type desired, to which may be added, says Mr. Hahn, slag or metallic iron, if we follow Webster's definition of flux, as "any substance or mixture used to promote the fusion of metals or minerals."

The action of slag is, however, generally more of a mechanical than of a chemical nature. If a coarse-sized smelting mixture is to be worked, an addition of slag to promote its fusion is entirely superfluous, and would only increase the cost of smelting; but if the charge is very fine, or if much zinc is present in it, slag will very materially promote its fusibility. Fluxes should be as free as possible from impurities to insure success in smelting. Thus a bituminous or silicious limestone would not be exactly the correct flux to select if we wanted lime for ore. As carbonic acid does not take any part in the composition of a slag, burnt lime would theoretically be the best; but as it rapidly attracts carbonic acid and water, thereby reducing its money value, and as it presents mechanical difficulties in the furnace, its application has never become general. It was at one time extensively used at some smelting works in Leadville. The presence of extraneous minerals in quantity of course increases the bulk of fluxes at an enormous rate, while the ore may become the smallest part of the smelting mixture. In this case the percentage of lead in the charge will arrive at a point where lead smelting is no longer profitable. Such cases have occurred in Southern Arizona, where had fuel and poor fluxes have ruined the lead smelter.

Scorification.*

In this method the litharge is made from lead during the operation. Scorification is the surest and simplest method of all. It is well adapted to rich ore but not to that which is poor, on account of the smallness of the quantity treated, or the time and fuel consumed. However, ores containing nickel, tellurium or tin, are better scorified, and buttons containing tin or nickel cannot be cupelled until scorified. Ores are scorified with an addition of granulated lead, and generally borax.

Granulated lead, like litharge, contains silver, and must be assayed. Take lead, 2 ounces or 60 grammes; glass, 60 grains or 4 grammes. Mix in a scorifier. Place in the heated muffle and close the door until the lead is melted, then open the door and maintain a moderate red heat, keeping the lead fused. When the lead is covered by the slag, remove from the muffle and pour into the assay mould. Return the scorifier to the muffle, and as soon as the assay is cool enough to separate the slag, return the lead to the scorifier, and so on until the lead is of suitable size for the cupel; weigh the resulting lead, and note its weight and that of the lead used, in the assay book.

Ordinary ores require from 8 to 12 parts of lead. Galena, or silver glance, 2 parts. Those containing much iron, zinc or tin, or of which the gangue is lime, require more lead; sometimes as much as 32 parts to one of ore. Tellurium may require 100 parts. A small quantity of horax is beneficial unless the gangue is quartz. With an unfamiliar ore it is best to make several assays, each with a different quantity of lead. If that one in which the greatest quantity of lead was used gives the highest result, another should be made with yet more lead, and so on until two assays agree. The following is a general formula for ordinary ores: Ore, 60 grains or 4 grammes; lead, 1½ ounces or 48 grammes; and a little dried borax, unless the gangue is quartzose.

Mix one-half of the lead with the ore and horax in the scorifier. Cover with the remaining lead. Place in the darkly red hot muffle. Close the door and increase the heat very gradually until the lead is thoroughly melted. [Some writers advise the rapid heating of the assay; with some ores this may do, but it would seem that it must always be dangerous, and with the ore of the Silver King mine, in Arizona, it caused sputtering.] Open the door and moderate the heat. The ore will be seen floating upon the lead. It soon takes the form of a ring, leaving the lead exposed. This is called the "bull's eye." If the bull's eye does not appear, the assay will fail. This is sometimes caused by the ore not being finely ground. When the bull's eye appears, maintain a cupelling heat by managing the damper and the door of the ash-pit. When the bull's eye is covered by the melted slag, add a couple of lumps of borax, by means of the cupel tongs; close the door, and give a higher heat for about five minutes. Meanwhile, heat to redness the suitably bent end of a thick piece of iron wire, then with it stir the contents of the scorifier. If any pasty lumps be felt, add a little more horax and close the door. The stirring must not be prolonged, especially with arsenical ores, or the wire will melt away, and the iron will form a crust on the assay. When the slag is perfectly fluid, the assay may be poured. The scorifier should be returned to the muffle (unless it is much corroded, when a new one must be taken), because the button may be too large, and must then be re-scorified. There is less loss of silver in scorifying the lead than in cupelling it; therefore the more the weight is diminished, within reasonable limits, the better. The button is cleaned and prepared for cupellation as in the crucible assay. The slag should be glassy; the color depends on the kind of ore. The lead button must be soft.

When very sulphurous ores are assayed, it is best to omit the horax entirely until the bull's eye is covered. When 32 parts of lead must be used, only 30 grains of ore, or 2 grammes, can be treated in a 2-inch scorifier. The scorifiers are handled by means of the scorifier tongs, and may be used until too much corroded, though the same rules apply to these as to crucibles in regard to re-use. As a scorifier may occasionally be pierced by the litharge formed, it is well to have an extra bottom in the muffle. Such a bottom may be bought, or made by cutting another muffle. The muffle bottom, extra or not, should be protected by a thin layer of bone ashes, which will absorb the spillings in case of accident, and may be scraped out. The scorifiers may be in a measure protected by rubbing the inside with reddle. Scorification furnishes a convenient means of purifying as well as lessening the weight of a button got in the crucible. By this means any substance, except the noble metal, may be removed from lead.

*This extract is from a simple practical work on "Assaying," by Chas H. Aaron, now being issued and for sale by Dewey & Co., S. F. Price $1.

AT the recent annual meeting of the Kentuck Mining Company, the following named gentlemen were elected Trustees: Wales L. Palmer, President; H. C. Swain, H. H. Noble, Wm. Hardy and J. W. Pew, Secretary. The working of the mine is leased to C. C. Stevenson. Eight dividends of $3,000 each have been paid this year, and there is a reasonable prospect of several more of the same kind.

The Bower-Barff Process—No. 3.

These magnetic-oxide processes not only protect from rust, but the coating is of such a beautiful color as to render articles ready for the market as soon as they are out of the furnace and cooled. One remarkable feature of them is that there is no more cost (except in the labor of handling them) in treating 2,240 articles, each weighing a pound, than there is in coating a tube of metal weighing a ton; and so penetrating is the process that no matter how intricate the pattern may be, every crevice—which it would be almost impossible to get at with a paint-brush—is as effectively coated as the plainest surfaces, as will be observed by examining the specimens exhibited. For art purposes the French gray color, with shades approaching to black, might not always be suitable; but if it should be necessary to use paint on the iron so coated, there is absolute certainty that it will remain on in the same way as it does on wood or stone, and thus iron may be used for constructive work in a thousand directions in which it has not up to the present time been possible on account of its liability to rust, no matter what the coating used to protect it has been.

Engineers and Manufacturere

Appear far more ready to apply the processes here and on the Continent of Europe than up to the present time they have been in England. Perhaps the reason has been that, so far as Professor Barff's process is concerned, it has only just been shown how large masses can be dealt with—namely, by the use of the Bower furnace. I can show that, for the treatment of underground pipes, wrought-iron sleepers, roofing and the like, the process can be readily applied, and at a cost much less than that of galvanizing, and they will at the same time be infinitely more durable; while for ornamental cast and wrought-iron it is scarcely possible to imagine anything more artistic in color than some of the articles after they have been treated. For ordinary hollow-ware for kitchen use, whether of cast or wrought-iron, this process is admirably adapted, and though I have been told that the gray or black color will probably be objectionable, yet I imagine, if it can be shown, as can be done, that the magnetic oxide is more durable, more easily cleaned and much cheaper than even the common tinted article, a market will soon be created. Anyhow, the new combined processes are so far developed, and they have been so thoroughly examined by scientific and practical men both here and in Europe (whose testimony to the value and efficacy of them is voluminous), that they have passed from the region of theoretical investigation into that of

Practical Application,

And means have been taken for establishing works at different centers in Europe, as will also be done here, for the purpose of coating iron and steel as a trade operation. One firm alone in Scotland, Messrs. Walter Macfarlane & Co., have adopted the process, and their output of ornamental castings per day exceeds 100 tons. It is intended to apply the process to cast-iron gas and water pipes, and as the former have comparatively no pressure to bear, they may be made much lighter than they now are, if rendered incorrodible; while for water, it will be a great advantage to have both the main and service pipes rendered safe from rust, which not only discolors the water, but forms the nucleus of very troublesome deposits. There is no reason now why wrought-iron or mild-steel pipes should not be used for the same purposes, especially for the interior towns of distant countries, where the first cost of the pipes is but small as compared with the cost of carriage.

It will naturally be asked, what is

The Cost of the Process?

I cannot do better than answer the question by quoting from the report of Professor Flamache, the engineer-in-chief of the State railways in Belgium, who was sent over specially to England to report on the process by the Public Works Department of that country. His estimate of cost, after a very careful examination and testing of the process was 7½ francs per 1,000 kg., or nearly $2 per ton, at, of course, the Belgian rate of expenses. He also gives the cost of coating a certain extent of surface, but this I consider to be completely valueless, as, for example, I have had a furnace full of 56-pound weights, and another time I have had it full of gas-governor tops, the surface in the latter case being perhaps one hundred times more in extent than in the former, while the actual cost of oxidizing would be the same in both cases. He also says that this cost may be reduced, as instead of one workman attending to one furnace he can attend to three or four; also by a better system of taking the articles out than existed in the experimental furnace that he saw.

Sir Joseph Whitworth, feeling much interest in Professor Barff's process, sent to him some steel to be oxidized, so that he might ascertain whether it did or did not lose in strength by the operation, and the result of Sir Joseph's

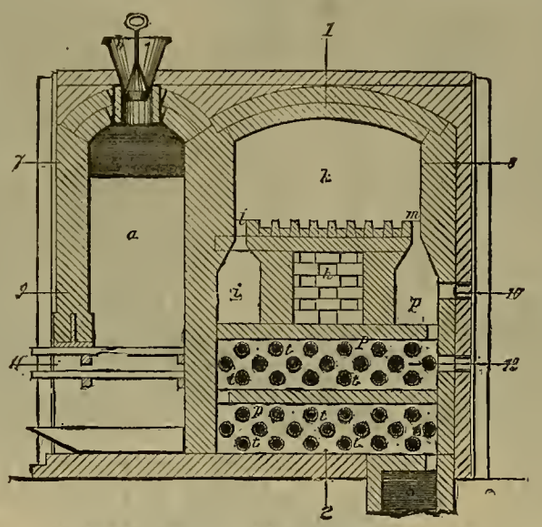

Fig. 5.—TRANSVERSE VERTICAL SECTION, BOWER-BARFF FURNACE, ALONG LINE 5-6 IN FIG. 3.

testing was that there had been no alteration whatever. Theoretically, one would rather expect that iron and steel would be somewhat toughened, as the tendency of the process is to anneal, and would, no doubt, if continued long enough, render some classes of cast iron malleable. A very thin article, if excessively coated, might probably be weakened, due to the fact that the coat of magnetic oxide would form an appreciable percentage of the bulk of the article; but this, of course, is a very extreme case, and one which is not likely ever to occur in practice.

The development of these processes has been a long and tedious business, and one requiring much faith and patience in the midst of most disheartening failures for months together; but to gentlemen connected with the iron and steel industries, and who know well that results are only obtained by patient and well-directed toil, I need not dwell on this, as almost every man who has had to reduce theory to practice has had abundant experience of the same kind.

JOHN SHIPTON, an old colored pioneer of the Comstock, died at Virginia this week. He was well known to all old residents.

THE Vignite Powder Company has declared its first dividend this week.

Blasting in Mines—No. 18.

Safety-Nitro Powder.

The safety-nitro powder is one of the more modern explosives, having only been introduced in 1881; but since that time it has been largely put into use so that the capacity of manufacture of the company has been twice enlarged. Very extensive works have been erected on the bay shore by the safety-nitro company, who make, in addition to the explosives, acids as well. Three grades of safety-nitro powder are made, known respectively as Nos. 1, 2 and 3. The strongest made is the No. 1, and it is used to deal with hard rock, and where great force is to be exerted on a small surface. If the blasting is to be done in a softer material, and a large mass to be handled, No. 2 is used. Still another mode of action is often desirable—a heaving action. With the No. 3 small holes are required, and there is very little or no smoke. The No. 3 is used for such work as black powder is intended to do.

Although the company know very well that experienced blasters have their own rules, they suggest certain directions for the use of safety-nitro powder, as follows: Use the quantity as with the high explosives of equal grade, until

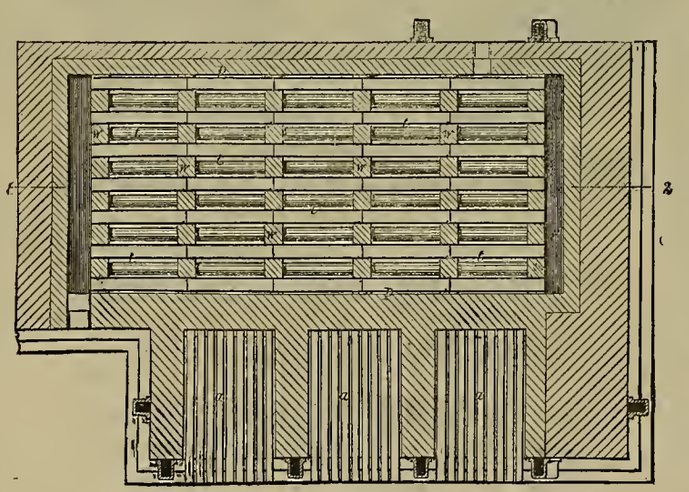

Fig. 6.—HORIZONTAL SECTION, BOWER-BARFF FURNACE, ALONG LINE 11-12 IN FIGS. 1, 2 AND 5

satisfied less will do its work. In loading use a wooden tamping bar and ram the charge well home, so that the powder will be well packed in the bottom of the hole. In tamping fill up the hole with sand, clay or earth, and tamp well so as to entirely exclude the air; this will insure an effective blast. To explode the cartridge insert the fuse into a tripple or sextuple cap, taking care that it is well in contact with the fulminate in the bottom of the cap, then nip the cap tightly at the top, around the fuse—insert the cap with fuse attached into the cartridge and let it down into the blasting hole. In dry holes, especially in close drifts or tunnels, it must be remembered that paper smoke is unpleasant, and therefore the miner should slit up the paper and drop only the powder into the hole; then pack it well in the bottom with a wooden tamping rod. In wet holes the paper wrapper must be retained, as it is impossible to load properly without it.

To avoid miss-shots only the best of fuse and caps should be used; they are the cheapest. One miss-shot will more than pay for a box of caps. Care should be taken that the fuse is cut clean and square before inserting it into the cap, and that the cap is free from sawdust in the inside. In wet holes, be sure and grease well the joints between the caps and fuse, so as to exclude moisture or water. In cases of doubt put down an extra fuse and cap and light both fuses. It makes the matter sure, and the extra cost is trifling. When practicable use a priming cartridge—that is, pack the charge in the hole; then place the cap in the last cartridge, tie it fast, and lower the priming cartridge upon the main charge; then fill the hole and explode. Only tripple-force caps are used with these powders.

To light a fuse easily and quickly—split the end, and insert a very little of No. 1 or No. 2. This will hold the fuse-powder in place, and enable you to light it with ease and certainty. In tamping powder, always use a wooden rammer. Never use an iron or steel bar with any explosive. Handle caps carefully, and never keep or store them in the same place with powder. Don't get nitro-glycerine on your fingers. Always thaw frozen powder by gentle heat. Never roast cartridges. Not only is it dangerous, but it decomposes and injures the powder. Black powder will develop a marked increase of force if fired with a primer of any of these high explosives. The lower grades will prove more effectual if fired with a primer of No. 1. Always fill the hole with something when using these powders. Dry sand makes the best tamping, but anything which will exclude air will answer.

The company speaks as follows of springing in its circular: The No. 1 and No. 2 are admirably adapted for springing. The enormous strength of our No. 1 fits it specially for this work. It springs a large "pot hole," and springs it deep. As a rule, No. 1 for springing is best, as the most economical. But, in soft or medium ground, many experienced blasters use No. 2 with excellent results. In springing holes, a small hole is converted into a large one, and thereby much labor is saved. Every expert at blasting has his own method of doing this work. Nevertheless, we venture to give the way which has given us the best results: Pack a small quantity of powder firmly in the bottom of the hole. Now, lower upon it a small primer, being sure that the primer is well in contact with the charge. Pour in a handful of dry sand, to exclude the air; then explode. By this means you have enlarged the hole at its very bottom, and can now get a charge of powder well down, where it will do the most good.

As these powders are safe to pack, even in the most ragged hole, you can fill this enlarged space with powder, either for further springing or for throwing, as you desire. It is wonderful how much better execution powder will do when packed in this way in the very bottom of the hole.

Among the claims made for these powders, aside from their strength and adaptation to various classes of work are: freedom from leakage, safety in use, lightness of smoke, plastic character, and great downward force. The company state positively that some of their powders contain chlorate of potash, but that they are made of the best materials. They make a strong black powder known as E. S. E., which is furnished in bulk or in cartridges. The safety-nitro powder has been extensively used in mining and railroad work on this coast, since its introduction, and many testimonials on its efficiency have been given the company.

MR. ELLIS HARRIS, whose business consists of shipping ore from Leadville to Utah smelters, and who has been in this city for the past ten days, left yesterday via the D. and R. G. for Colorado. He ships on an average from the Fryer Hill mines about ten cars of ore a day, amounting to about one million pounds a week. The ore is shipped to the Horn Silver, Mingo, Germania and Morgan smelters, and Mr. Harris says the reason for shipping the ores such a great distance is the fact that there is a better market in Utah for the class of ores shipped than in Colorado.—*Salt Lake Tribune.*

BIRMINGHAM, one of the most enterprising, go-ahead towns in Alabama, is going to erect an exposition building for minerals.

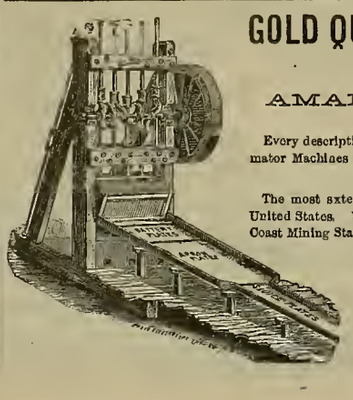
CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of these mills on the Whidden mine, in El Dorado County, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop-stamp mill:



1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use; all of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it, and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

GOLD QUARTZ and PLACER MINERS'

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

PREVENTS LEAD POISONING AND SALIVATION.

Invaluable to those engaged in dry crushing quartz mills, quicksilver mines, white lead corroding, feeding thrashing machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and, if not satisfactory, the price will be refunded. Price, $3 each, or $30 per dozen

Notices of Recent Patents.

Among the patents recently obtained through DEWEY & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BASIN AND WATER-CLOSET VALVE.—Holland Smith, S. F. No. 289,437. Dated Dec. 11, 1883. The water-supply pipe and the waste pipe are brought near enough together at some point below the howl to allow the valves which control them to he operated hy a single shaft, to which they are connected. An arm or crank is connected with the shaft and a treadle attacbed. When the washbowl is to he used the foot is placed upon the treadle and all the valves opened. The plug heing on the discharge opening of the hasin the cocks may be opened and water drawn for use. After use the plug may he withdrawn and the contents allowed to escape through tbe wasté pipe. The treadle heing released, a weight or spring will revolve the shaft and close the valves so no water can run; neither cau there be any escape of sewer or other noxious gases from the waste pipe. The valve acts on a perfect seal; the waste valves are closed as soon as the treadle is released, so if tbe cocks should he carelessly left open there would be no flooding, as the supply would be cut off instantly when the person released the treadle to go away.

SEWER GATE.—Samuel Johnson, S. F. No. 289,108. Nov. 27, 1883. Tbis is an automatic or self-acting sewer gate. The automatic gate is suspended on a horizontal shaft or axis, so that a greater area of surface is presented above the axis, said gate having a float on its lower and outer side. When left to itself the gate will close against a frame, and the flow of water down the sewer will press it closely, so that none can pass, until it has risen above the rod or shaft near the top of the gate, when the superior pressure upon this part, produced by the greater area, will lift the gate, and cause it to turn about its shaft and open. To prevent the rush of water from closing the gate again, on the hack or lower side is a large float, formed so when the gate is first tilted and opened the float will cause it to rise and lie on the surface of the water, wbich flows heneath the float. When the water bas nearly passed out tbe augle will he such that the water will again act upon the front of the gate to close it, and the operation will he repeated.

SHOE FOR GRAIN SEPARATORS.—Arthur H. Johnsou, Woodland, Yolo Co. No. 289,915. Dated Dec. 11, 1883. This shoe is made of light pieces set at right augles to each other, the ends being on top of the sides iu order to properly inclose the riddle which is laid on the shoe. Attached to the sides of tbe shoe are flexible strips (preferably leather) having flexihle tongues hy which the shoe can he adjusted from the outside to any inclination, or to raise or lower any coruer, or otberwise change its position, according to circumstances. A combiuation of movements is perfected—namely, a side motion of the shoe and an end motion of the grain board. Tbis is heneficial in its effects. It gives a hetter agitation to the grain than if both moved in the same directiou, and thus allows the wind to clean it up thoroughly.

MOTOR.—Camille de Mezerville, Santa Clara. No. 289,889. Dated Dec. 11, 1883. This is a motor of that class in which tbe power of a weight or weights is transmitted through a series of gears to the machine or mechanism to he operated upon. The invention consists in the means for throwing the driving gears on and out of engagement; in the means for operating the winding drum to elevate the weigbts, and in the meaus for causing the hoisting ropes to lay up even on the drums. Tbe object is to provide a simple and practical motor for driving small macbines, such as sew ing machines and the like.

SAW TOOTH.—Eugene Smith, S. F. No. 289,576. Dated Dec. 4, 1883. This is au improvement in insertihle teeth for saws. It consists of a peculiarly sbaped tooth, and its combination with and iusertion into the saw plate in such a manner as to bring the strain wheu at work in the direction of the length of the tooth, to provide a strong support for the teeth and a perfect clearance while enahling the teeth to he placed morc closely together, and to allow the teeth to be sharpened until worn out without altering their angle.

DESIGN FOR BRACELET.—Robert H. Ahn, S. F. No. 14,438. Dated Nov. 27, 1883. Heretofore bracelets have heen formed of rounded wires bent into the proper oval or circular shape to iuclose the wrist, the ends extending past each other a short distance wheu in place, and having ornameutal eud or other devices, the elasticity of the hoops retaining them in place on the arm. This design consists of a hoop or bracelet having its outer periphery concaved so as to show one or more grooves or channels.

IF YOU want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. CO., for "Lubrice." It is the best compound-grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils

Mining Share Market.

The approach of the holidays has had an effect on the market to make it still duller than before. Ophir has attracted considerable attention as its annual election took plaee on Wednesday. This we refer to elsewhere. At Gold Hill it has been found necessary to lay off a considerable number of miners at the leading mines on account of the low stage of water in the Carson river. This temporarily affects the business men on the Comstock, but in no way directly influences the stock market. The water has been all taken out of the Alta and resuming of operations on the 2150 level, and brisk times may be looked for at the south end. In a few days the new hydraulic pump at the Chollar-Norcross-Savage shaft will start up, which will give new life and activity to all the middle Comstock mines. The south drift in the Union Con., on the 3100 level, is still in vein porphyry. The ore streaks eut in the winze lie to the east of the drift. It is found that the whole stratification, at a short distance south of the 3100 station, has changed its course and is now bearing toward the southeast. In order to find the ore streaks encountered in the winze, it would be necessary to crosseut to the east, but a connection with the main north drift being at this time of prime importance, the drift is being pushed directly south as rapidly as possible.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with tbe interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it tbeir own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will he called to this (as well as other notices, at times), by turning a leaf.

Bullion Shipments.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performanees. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

ADDRESS all correspondence to the name of the paper or firm, as either of the publishers or editors connected with the office are quite likely to be absent at times.

Addresses. Business letters should be addressed and drafts made payable to DEWEY & Co.

SEEK

health and avoid sickness. Instead of feeling tired and worn out, instead of aches and pains, wouldn't you rather feel fresh and strong?

You can continue feeling miserable and good for nothing, and no one but yourself can find fault, but if you are tired of that kind of life, you can change it if you choose.

How? By getting one bottle of BROWN' IRON BITTERS, and taking it regularly according to directions.

Mansfield, Ohio, Nov. 26, 1881.

Gentlemen:—Ihave suffered with pain in my side and back, and great soreness on my breast, with shooting pains all through my body, attended with great weakness, depression of spirits, and loss of appetite. I have taken several different medicines, and was treated by prominent physicians for my liver, kidneys, and spleen, but I got no relief. I thought I would try Brown's Iron Bitters; I have now taken one bottle and a half and am about well—pain in side and back all gone—soreness all out of my breast, and I have a good appetite, and am gaining in strength and flesh. It can justly be called the *king of medicines*.

JOHN K. ALLENDER.

BROWN'S IRON BITTERS is composed of Iron in soluble form; Cinchona the great tonic, together with other standard remedies, making a remarkable non-alcoholic tonic, which will cure Dyspepsia, Indigestion, Malaria, Weakness, and relieve all Lung and Kidney diseases.

NOTICE OF ASSESSMENT.

The Land Purchasers' Association.—Location of principal place of business, San Francisco, Cal.

NOTICE IS HEREBY GIVEN, that at a meeting of the Board of Directors, or Trustees, held on the 5th day December, 1883, an assessment of five dollars ($5.00) per share (being balance of 44th and part of 45th installments) was levied upon the capital stock of this corporation, payable immediately to the Secretary at the office of the Company, 318 Montgomery St., San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 7th day of January, 1884, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 12th day of February, 1884, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

EDWARD P. GRAY, Secretary.

OFFICE—318 Montgomery St., San Francisco, Cal.

N. B.—This Assessment is to pay the taxes on the Association property for the current year.

MINES EXAMINED

In any part of the State; reliable reports made by a Competent and Practical Miner. Mismanaged properties reorganized. New mines put in shape for economical working. No untried experiments and no "hobbies." Prices moderate. Best Nevada and California references. Correspondence solicited. Address,

CHARLES L. LANG,
Sonora, Tuolumne Co., Cal.

Job Press for Exchange.

We have just received a new improved Rotary Job Printing press of approved style and make, which we will sell at a bargain or exchange on favorable terms for a Washington hand press. Size of chase inside 7x10 inches.

DEWEY & Co., publishers.

The Lemmon Herbarium.

This Herbarium has been removed from the Blake House to a permanent place at 1205 Franklin St., near Fourteenth St., Oakland, one square east of the Post Office, where plants of the Pacific Coast, including Arizona, may be determined on application, and instruction given in botany during the winter. Sets or single specimens of the rare and new ferns of the Pacific Coast for sale.

Business Offices and Sunny Rooms to Let.

We have some desirable rooms to let adjoining the offices of this paper, which will be rented on favorable terms. Stair entrance, No 252 Market St. Elevator, No 12 Front St. Parties wishing offices, etc., will do well to call and see them. DEWEY & CO.

Academy of Sciences.

A regular meeting of the Academy was held on Monday, President Davidson in the chair. J. G. Lemmon made some observations about new species of plants he had discovered in Arizona. Dr. Harkness also exhibited a large variety of vegetable galls.

The following were proposed for membership: Henry R. Taylor, S. M. Mouser, M. D.; J. Labadie, Secretary of the Mexican Legation; Carlos Mexia, Mexican Consul; Wm. F. Smith.

Professor Davidson gave a brief explanation of the method of determining by the micrometa, the difference of declination between the comet and any star. The Professor observed that a remarkable thing about the present comet—Pons-Brooks—is the rapidity of its movement and also of its development. He then referred to the ruddy glow in the western sky at evening and the eastern sky in the morning, which has been observed recently, adhering to his former statement, attributing it to smoke.

Dr. Harkness said he would like to have it explained how smoke separates the red from all the other rays of light, and how in the absence of all pervading fires, the whole continent could be enveloped in smoke. He said he rejected the volcanic theory, and he seemed disposed to insist upon that of aqueous vapor in the air. He said he had observed closely at morning and in the evening, and he had been unable to detect any smoke.

Professor Davidson replied that he was not called upon to explain why smoke separated the rays any more than he was to explain why the prism did. The two facts stood, whether they were explained or not. He had applied the test of the speetroscope, and, besides, it was well known to all scientists that, in flashing signals with the beliotrope, when the signal was given through a smoky atmosphere the light was always red, and when there was no smoke it was white. With regard to the doctor's statement that there was no smoke in the air, the Professor stated that he had recently been sending signals to distant points with the heliotrope, and that they had been greatly obstructed by the smoke in the air.

The committee to make nominations of officers for the ensuing year, reported the following: For President, George Davidson; first Vice-President, H. H. Harkness; second Vice President, H. Herrmann Behr; Corresponding Secretary, Samuel B. Christy; Recording Secretary, Charles G. Yale; Treasurer, Elisha Brooks; Librarian, Carlos Troyer; Director of the Museum, William G. Harford; Trustees—C. F. Crocker, R. W. Simpson, George E. Gray, Thomas P. Maddeu, Ralph C. Harrison, James M. McDonald, L. Gerstle. The following were elected Inspectors of Election: W. F. Meyers and Archibald Cooper; Judges, Alphens Bull, Jr., and Charles Wolcott Brooks.

EDUCATE THE GIRLS.

THE HARMON SEMINARY,

Berkeley, Alameda County, Cal.

A FIRST CLASS BOARDING SCHOOL FOR YOUNG LADIES.

Mrs. F. W. HARMON, Principal.

THE CHARACTER OF THE INSTITUTION:

It is the aim of this institution to furnish the best attainable education for young women. The imparting of useful information and mental culture is attended by the most intelligent effort to develop true womanly qualities, and to instill principles of good taste and sound judgment. Thus, the institution possesses a family character in its best sense.

The charges for tuition and board are made as low as possible without sacrificing excellence, so as to place the School within the reach of those whose means are moderate. It is a principle of this School that those who are wealthy as well as those whose means are limited, should, as a part of their education, be taught to practice economy, and by their example discourage extravagance in dress and personal expenditure, either for ornament or luxury.

It is not an ambition of this School to bring together a large and imposing array of pupils. Its numbers are limited; hence each pupil receives that close personal attention and instruction rendered impossible where multitudes are gathered together.

THE NEXT TERM WILL OPEN JANUARY 3, 1884

For Catalognes or other Information, addres Mrs. F. W. HARMON, Berkeley, Cal., or E. J. WICKSON, 414 Clay Street, San Francieco

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make users of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,

STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

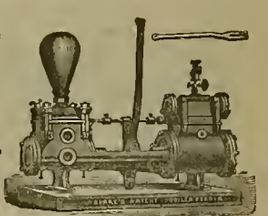
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.



The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

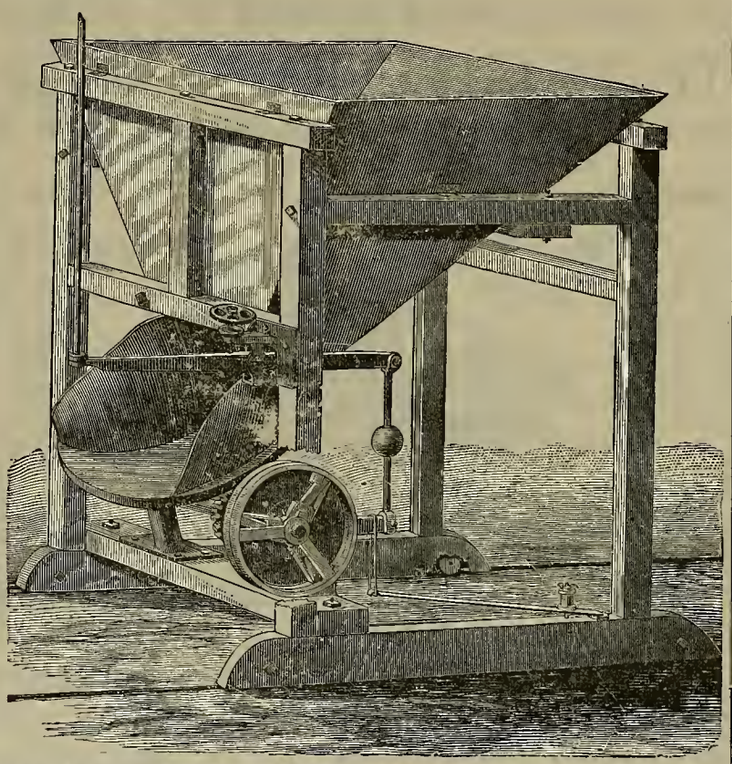
"Challenge" Ore Feeders.

OVER 1100 HAVE BEEN IN SUCCESSFUL OPERATION.

Awarded First Premiums at the Preceding and last Industrial Fairs of the Mechanics' Institute of San Francisco.

TWENTY PER CENT. MORE ORE CRUSHED WITH FIFTEEN PER CENT. LESS WEAR OF IRON THAN BY THE OLD METHOD OF HAND-FEEDING.



The opposite cut illustrates the recently-introduced Grip and Spring Attachment, which replaces the Weight originally used, and result in an obvious improvement.

The practical operation of the large number of these machines now in use demonstrates the fact that the principle upon which a perfect Ore Feeder *must* be constructed is that of a *carrier* and not that of a shaking table. Uniform feeding is not possible upon the latter plan. The ore must be *evenly carried* upon a steadily-advancing plane or table to the line or point of discharge, and there be simply dropped. Jerky or spasmodically acting contrivances will not answer the purpose for feeding wet or sticky ores, nor for the ores of mines where they may change from sharp quartz to an interm xed material of quartz and earthy matter.

These Feeders are in Successful Practical Operation in the Following Quartz Mills, and are giving Perfect Satisfaction to their Managers.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

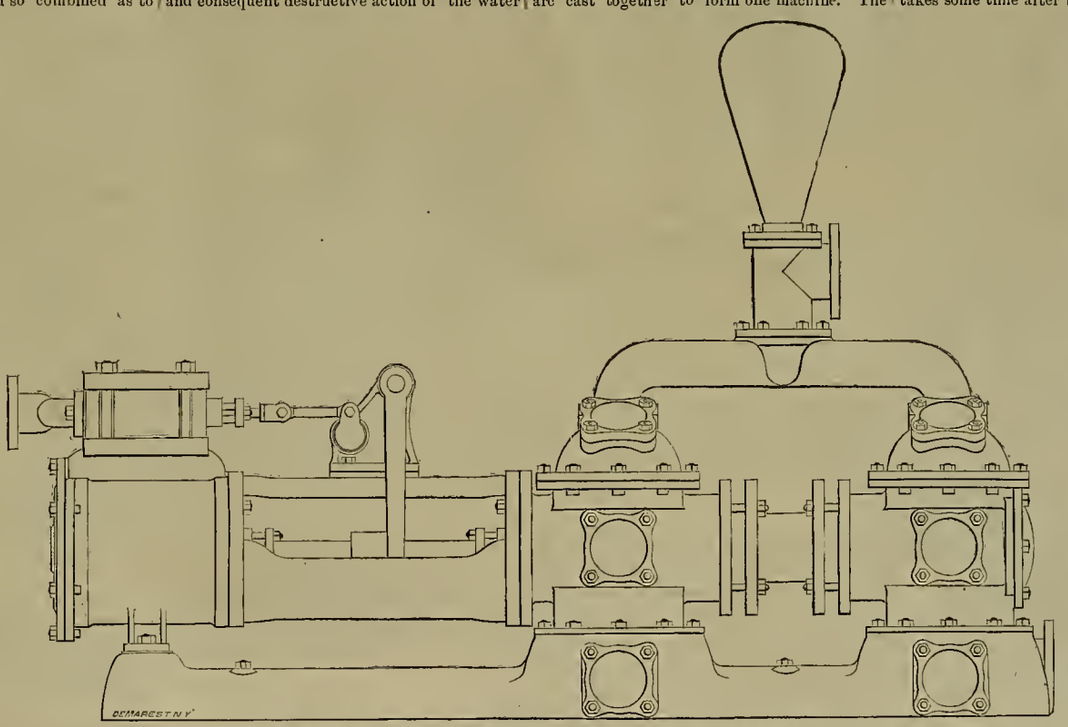
VOLUME XLVII Number 26.

The Worthington Mine Pump.

The steam pumps of the Worthington type which have come so largely into use in this country in water works, hotels, apartment houses, etc., are now being introduced on this coast for general work and also for mining purposes. It is claimed that the machine is distinguished for great strength of construction, having few moving parts, with no harsh motions, and not subject to fracture or other derangement. The system of renewal of the working parts has been proved by long experience to be the least expensive and most satisfactory for ordinary work.



The valve motion is the prominent and important peculiarity of this pump, as being that to which it owes its complete exemption from noise or concussive action. Two steam pumps are placed side by side, and so combined as to act reciprocally upon the steam valves of each other. The one piston acts to give steam to the other, after which it finishes its own stroke, and waits for its valve to be acted upon before it can renew its motion. This pause allows all the water valves to seat quietly, and removes everything like harshness of motion. As one or the other of the steam valves must be always open, there can be no dead point. The pump is, therefore, always ready to start when steam is admitted, and is managed by the simple opening and shutting of the throttle valve. In its application to steam pumps for ordinary service, as well as to water works engines of the largest class, a combination of reliability, with economy in first cost, and in running expenses, is attained, not realized by any other type of pumping machinery. In the arrangement of the Worthington steam pump, special care has been taken to have the parts easily accessible for inspection or repairs. All the moving pieces being made to gauge, can be readily renewed. The successful application of a pump depends much upon its proper selection from among many patterns differing from each other in size, proportion, material and general arrangement.

It is a difficult matter to design and construct a steam pump that will satisfactorily meet the very exacting requirements of mine pumping. The service is generally rough, severe and continuous. Great care must be exercised both in the selection and adaptation of the material used in construction, as the water to be pumped is often of a kind that will attack and quickly destroy it. The location of the mine is usually remote from supplies, and any necessity for renewals or repairs, unless they can be made with unskilled labor and with little delay, may be attended with serious consequences. These considerations therefore demand that a mine pump should be extraordinarily durable, simple and efficient, and have led to the construction of the form of Worthington pumping engine illustrated on this page. In it are embodied the results of the best practice heretofore, together with some important improvements that have been recently secured by letters patent. The plungers of this machine work through central, exterior stuffing boxes, into four separate and distinct water cylinders. These cylinders are all precisely alike, subdivided as much as possible, and having each part or attachment of the one an exact duplicate of the corresponding part or attachment of the other three. This duplication and subdivision greatly facilitates renewals or repairs. The valve areas and water passages are unusually large, so as to decrease the velocity and consequent destructive action of the water currents. The plungers, piston rods, stuffing boxes, and the entire suction and force valve plates are made of a metal composition that has been found best adapted to resist this action. Wherever natural wear will in time take place, the part so worn can be readily and quickly replaced without disturbing any adjacent part.

The pumps are designed to safely withstand a working pressure of 200 lbs. to the square inch, and all their attachments are especially strengthened with a view of meeting the rough usage and hard work to which, in this service, they are liable to be subjected.

Some five sizes of these pumps are kept in stock. The company have now pumps delivering 1,000,000 gallons per day, against a pressure equal to 3,800 feet head; and will contract to force any specified quantity of water to any required hight. There are a few of these mining pumps now at work on this coast. A Worthington pump at Toledo Water Works has been pumping at the rate of 10,000 gallons 100 feet high, at a cost of 3 7-10 cents. The pump at Salem, Mass., has performed a duty 83% better than the average duty of the City of Brooklyn Water Works for 14 years, with expensive beam and rotative engine; more than 123 per cent better than the average duty of Chicago, with their rotatives for nine years; 268 per cent better than the Delaware pumping station for Philadelphia for two years, and 123 per cent better than the Cornish engine, at Louisville, Ky.

Mr. A. L. Fish, manager of the San Francisco office, at 30 and 32 First street, states that the pump here shown may be high pressure, may be compounded, or may be compound and condensing. The durability and smooth and noiseless action of this pumping engine greatly commends it. To effect the valve motion two steam cylinders and two pumps are cast together to form one machine. The right hand division moves the steam valve of the left hand one, and vice versa. Under this arrangement one pump takes up the motion when the other is about to lay it down, thus keeping up a uniform delivery, without pulsation or noise. As the work is divided between two engines, the wear is also divided, and the lifetime of the machine doubled.

THE WORTHINGTON STEAM PUMP FOR MINING PURPOSES.

The local papers assert that the outlook has never been so fine in the Paradise, Nevada, mines as at present, large bodies of high-grade ore having been discovered both in the Wild Goose and Paradise Valley mines. For many years nothing but assessment work has been done on these mines, but there are now some forty or fifty men employed in each of them, and they are sending away an average of $25,000 per month. It is believed that the vein is permanent and the ore bodies extensive.

A vacuum motor machine company has just been organized at Portland, with a capital stock of $1,200,000.

A Mining Review.

It has always been our custom to publish an extended review of mining operations for the year, about the third week in January, and it is our intention to continue the custom this year. We shall, however, publish a larger quantity of matter than usual and will issue a double number of 24 pages. It is the purpose to give all the attainable figures of ore yield and bullion product from the different camps and districts of the mining States and Territories, together with such facts as will give the reader a general idea of the progress of the mining industry. Special attention will be paid to mining on this coast.

The reason for not issuing the "Annual Review" on the first week in January, is that it takes some time after the first of the month to obtain the returns, and as we desire them to be as full as possible we prefer waiting until the necessary facts can be compiled.

It is intended to issue a much larger edition of the number referred to than usual, as it will contain a large amount of matter which will be of use to those persons who have only a general interest in mining, as well as to those directly connected with the industry. In the latter class, however, it will be of special value, as much of the material being statistical will be worthy of preservation for reference.

We should be pleased to receive from any of the mining camps or districts reached by the Press, any observations as to progress or yield which may occur to residents or those having knowledge of the facts. There are many smaller camps that are prosperous, but of which little is said. We endeavor to notice them as frequently as possible in our regular "Mining Summary." For a general review, however, we must depend on some resident, and now urge upon them a request to send us such facts about the year's work as will be of general interest. We will receive and publish them with pleasure.

The Inyo *Independent* says: It is reported from authentic sources that it is exceedingly likely that arrangements will be made to immediately start the copper furnace at Soda Springs. This will be agreeable news for the owners of copper mines, as it will open a near market for the sale of copper ores, where both high and low grade ores can be realized upon.

New silver mines have been discovered in San Bernardino county on the edge of the Mojave desert, about forty miles south of Calico. The ores from the mines are chlorides, and the discoverers believe they will prove as rich as those at Calico.

CORRESPONDENCE.

Notes in Nevada.

[Written for the MINING AND SCIENTIFIC PRESS.]

Volcano Mountain—Petrographic Features—Extinct Solfataras or Geysers.

Between Walker Lake and Candelaria the Carson and Colorado railway traverses desert valleys and playas or sun-baked mud flats which occupy the lowest depressions between the bordering mountain ranges. That these are the beds of exiccated lakes is apparent in the extensive deposits of common salt, borax and other residual salts now profitably worked near Soda Springs and in adjacent valleys.

The country is one of extreme sterility and desolation; even the yucca, mesquite, cacti and other arid growths of desert lands farther south are absent, and sage is almost the sole representative of vegetable life. The rugged mountains rise on either hand of strangely tossed and tumultuous aspect, like monstrous billows petrified in the act of motion; the grand cleavages of gorges and arroyos, the varied hues and flexures of the strata, and every minor cleft and wrinkle being wonderfully limned and distinct in the dry air and glare of the sun, utterly unveiled by visible soil or vegetation.

Providentially, these forbidding wastes are replete with minerals useful to man, or the "Iron Horse" of civilization would not now awaken the echoes that through unrecorded time have known only the sounds of nature and the coyote's cry.

Nearly midway between the points mentioned, in the range on the north side of Soda Springs Valley, and a few miles from the new town of Luning, stands the rugged mass known as Volcano Mountain, which is not of plutonic origin, however, but is a vast uplift of limestone silicious schists of Paleozoic age, tilted to an angle of about 60° on its southwestern face.

This mountain is thickly seamed with metalliferous veins, severally carrying iron, lead, copper, antimony and silver, although as yet no extensive or profitable mine is opened therein.

This notable upheaval is especially interesting in its evidences of extinct thermal action, there being a line of ancient geyser vents on its southwestern face, at an altitude of 1,500 feet above the valley.

These vents are almost wholly closed by deposits from the receding solution; but one remains intact, of elliptical form, three feet by five feet in diameter, with mouth and spout-like lip, beautifully encrusted with crystals of spar.

I explored the inner recesses of this dead fumarole or geyser at considerable risk, and with no small discomfort, finding the cavity a few feet beyond the mouth expand to cavernous proportions, thence dropping sheer in an almost vertical spiral like the whorled chambers of some colossal shell to deeps unknown.

A pungent impalpable dust, the residuum of ages, had settled on every possible lodgement and assailed eyes and nostrils at every movement, almost quite obscuring the candle's dim glimmer.

The exploration was effected by the aid of a rope secured to a stick across the entrance—the descent being at times down a steep spiral channel eight or ten feet across—constricting now to a narrow throat, and again expanding into abysses of unknown depth, whose sheer, undersloping walls left the investigator no alternative but to retreat or swing down the rope by hand-grip into gloom and uncertainty.

The actual depth penetrated was about one hundred feet; but the floor which barred further descent was evidently a false bottom formed by the lodgement of fallen masses in a constriction of the channel.

Future mining operations will doubtless develop extensive caverns in the heart of this mountain, and, very probably, valuable metallic deposits.

Further evidence of extensive solfataric action appears in a huge ferruginous dyke which traverses the western flanks of Volcano mountain, thence sweeping in a wide circle around the slopes of a vast amphitheater, or basin of erosion, lying westward.

At one point along this dyke is found a deposit of nearly pure sulphur in solid nodules and concretions, from a few pounds each to several hundred weight, which may prove of much importance on further exploration.

The dyke is inclosed in calcareous strata which dip quaquaversally from the center of depression; and here the disturbing cause appears in the apex of a granitic peak which the deep erosion has uncovered.

* * * * * * *

Standing in the utter solitude of these gigantic upheavals, where, peering afar through hazy expanse,

> —"The eye may dimly trace
> A gossamer, as finely spun
> As spider's web, shine in the sun—
> Man's highest triumphs over space,"

And watching the worm-like train that creeps with barely perceptible motion through dreary leagues below, man realizes his physical insignificance in the vastness of nature.

Here, surely, might all human vainglory feel its futility, where an army of men—where the population of a great city—nay, the great city itself, might be

> "Sown in a wrinkle of the monstrous hill,"

and hide from the world its whereabouts!

A Paleozoic Beach — Fossil Characteristics, etc.

On the eastern flanks of Volcano Mountain, a distance of 3,000 to 4,000 feet horizontally through its base, from the granitic intrusion spoken of, and, approximately, 6,000 feet above sea-level, I found a well-marked fossiliferous belt of silurian age, which I traced and examined superficially, about one mile in lineal extent, and from one to three hundred feet wide.

This formation trends north and south over some minor ridges and *arroyos*; the portions most prolific in organic remains being an indurated sandstone and coarse arenaceous shale, in parts thickly intermixed with comminuted shells—doubtless the *exuviæ* of an ancient seashore.

These strata are flanked with finely-laminated shales, silicious limestones, quartzites, and other rocks exhibiting more or less metamorphism, in which the fossils grow fewer and ultimately fade out.

The remains were chiefly silicious casts of silurian mollusca which but rarely retained the calcareous structure of the originals.

The most abundant forms are of bivalves allied to the mussel and clam; a few *orthis lynx* and *orthis testudinaria*.

The gasteropods are represented by Pleurotomaria and Murchisonia, and the cephalopods by Orthoceratites and close-coiled Lituites. Of coral form I discovered only a few Cyathophylloids, probably Zaphrentis Canadense.

At different points along the fossil belt certain types were predominant to the exclusion almost of all others. Thus, for a considerable distance the bivalves prevail; in other portions Gasteropods occupy the ground, and at the higher and northern end of the formation, where it disappears on the crest of the hill in highly metamorphosed strata, the Lituites swarmed prolifically, and grew to a diameter of twelve or fifteen inches.

No trace was found of radiata or crustacea—not even of trilobites; and until a more thorough and competent examination of its fossil evidence is made, this formation may be assigned to a very early geological age—not later, probably, than the Trenton epoch of the Lower Silurian.

In consequence of the fissured and indurated character of the inclosing rock, no complete fossil specimens were gathered, with the exception of one small ostrea; doubtless, however, tolerably perfect forms may be secured by removing the weathered surface rock.

M. I. ANSON.

Assay of Salt.

Take a fair sample of the salt to be assayed. It must not be dried, because what is required is its value for the production of chlorine in the condition in which it is to be weighed for working, but if too coarse it should be crushed. Mix thoroughly. Dissolve 10 grains in about 50 grains, or rather less than ½ fluid ounce, of distilled or rain water, or at least water which gives no precipitate on addition of a drop of solution of silver in nitric acid. Filter the solution through a small wetted filter of fine bibulous paper. The filter must be well washed with water to completely remove the salt solution, and the filtrate and washings received in a flask.

To the filtered solution in the flask, add, drop by drop, a solution of silver nitrate until no further precipitation of silver chloride takes place. Warm slightly, and shake vigorously, stopping the mouth of the flask with a greased cork, until the precipitate is found to settle readily, leaving the liquid clear. Now transfer to a small filter, the weight of which has been previously ascertained after drying on a water bath until it no longer lost weight. Wash the precipitate and the filter with hot water until the washings are tasteless. Dry the filter containing the precipitate on a water bath until two successive weighings give the same result. From the weight obtained deduct that of the filter; the remainder will be the weight of silver chloride produced by ten grains of salt.

If the salt were pure and dry, 10 grains would produce 24.53 grains of silver chloride, but if we say 24.5 grains it will be sufficiently accurate. Multiply the weight of silver chloride found by 100, and divide by 24.5; the result will be the percentage of pure salt in the sample. EXAMPLE.—The silver chloride obtained from 10 grains of the sample weighs net 19.3 grains; then the sample contains $1930 \div 24.5 = 78.77$ per cent. of pure salt.

The silver chloride should be dried without much exposure to light. For a waterbath, the cover of a vessel in which some water is boiling answers very well. The pulp scales used in assaying ore are sufficiently accurate for this work, if sensitive to .1 grain.

The salt sometimes contains a considerable quantity of sodium carbonate, which neutralizes an equivalent quantity of acid. In the interior of the country, where this is most liable to occur, acid is very expensive on account of the cost of freight. Such salt should therefore be purified, by dissolving it in water and exposing the solution to evaporation in shallow vats, when the purified salt will be deposited. —*Aaron's Leaching Gold and Silver Ores.*

Amount of Salt Used With Ore.

Ores containing from 80 to 100 ounces of silver per ton should be mixed with ten per cent of salt. This is about the quantity considered necessary in the amalgamation works of Europe. Rich ore is often roasted with 20 per cent of salt. If all the chlorine of the salt could be transferred to the silver, an insignificant amount of salt only would be required for ores containing 100 ounces of silver—not more than 3½ pounds to the ton; but in consequence of the different ways in which the chlorine decomposes and unites with base metals and gases, the escape of chlorine from the surface of the ore without coming in contact with the silver, etc., a great deal more of the salt must be applied.

The usual amount of salt used for ores of the above value is from 120 to 140 pounds per ton of ore; that is, from 6 to 7 per cent. It is not advisable to take less than 6 per cent, even if the ore be poorer. There are instances, however, where 91 per cent of silver has been obtained by amalgamation from ores which were roasted with only 5 per cent of salt, and even less. There was no natural chloride of silver in the ore when treated with 5 per cent. (Rising Star ore, Idaho.)

As the salt is not at all decomposed before the formation of sulphates commences, or only to a very small extent, it is also in this respect immaterial whether the salt is charged at once with the ore or whether it is introduced two hours later, unless the ore is of such a nature as would bake easily on a little increase of heat. In other cases, however, it is obvious that, taking only six per cent of salt, and employing only one man at a furnace, a perfect mixing in a short time, as ought to be done if the salt is charged after the sulphur is burned off, can not be expected, and consequently a defective result will follow. It is, therefore, under such circumstances, important to have the salt and the ore introduced at the same time.

But a point of importance is the time when the salt should be added, if other objects are in view. If the salt is added together with the ore, or after the sulphur is expelled and sulphates are formed, in every instance the base metals will take up their share of the chlorine, and therefore more salt will be required. But, as the most of the chlorides are volatile, the salt is the means of getting rid of a great deal of the metals during the roasting, which in some instances is not very desirable. For instance, if a great deal of antimony and copper is in the ore, more or less chloride of silver will escape; sometime, however, only a small percentage. Treating the ore with salt from the beginning, or adding it two hours after the beginning, the result is the same.

A different result is obtained if the salt is added after all the base metals are desulphurized and oxidized. Some base metals, as antimony and arsenic, will be volatilized and thus gotten rid of, but not in so large a proportion as if chloridized. Iron and copper remain entirely in the ore, while both are volatile as chlorides. The roasting must be continued at a light red heat till all sulphates are decomposed and the metals oxidized. Applying the salt after the dead-roasting, the effect differs from the above so far that the base metal oxides now are not chloridized, or only to a small extent, while the silver alone (some of which appears to be changed to a metallic state, the most, however, remaining as a sulphate) will be chloridized. But in order to effect this chlorination, from one to two per cent of green vitriol must be added in order to accomplish the decomposition of all the salt. The copper is lost with the tailings unless smelted or extracted by diluted sulphuric acid.—*Kustel's Roasting Gold and Silver Ores.*

Wages in San Francisco.

Among other documents received by the Labor Bureau lately is the following statement of the Central Railroad Company of this city as to the wages of their employees and their hours for work. This statement applies to the services of 98 men:

Employees.	Wages Per Day.	Employment. Hours.
Foreman	$2.66	12
Conductors (men)	2.06	14½
Drivers	2.03	14
Hostlers	1.66	12
Blacksmiths	3.00	10
Trackmen	2.00	10
Other mechanics	2.75	10
Watchmen	1.66	12
Starters	2.33	12
Laborers	2.00	10
Teamsters	1.75	10

Central Pacific Employees.

The commissioner has also received the following elaborate statement from the Central Pacific Railroad Company, giving the number of employees and rates of pay of different classes, based on the month of November, 1882. The total number of employees cited in this document is 9,066; Clerks—6 at $200, 1 at $180, 4 at $175, 1 at $170, 2 at $165, 2 at $160, 11 at $150, 5 at $145, 10 at $140, 11 at $135, 3 at $130, 18 at $125, 7 at $120, 8 at $115, 6 at $110, 4 at $105, 32 at $100, 2 at $95, 27 at $90, 9 at $85, 2 at $80, 35 at $75, 4 at $70, 15 at $60, 4 at $50, 206 at $50 to $150; porters, 18 at $40 to $90; messenger boys, 4 at $20 to $35; agents, 225 at $50 to $225; station laborers, 740 at $60 to $75; conductors, 221 at $65 to $115; brakemen, flagmen, etc., 740 at $65 to $80; laborers, rodmen, etc., 64 at $35 to $90; pumpers, 60 at $65 to $85; patrols, 197 at $42 to $55; laborers, 1,367 at $42 to $55; laborers, 1,437 at $45, $50 to $52; laborers, 654 at $55; clerks, 29 at $80 to $200; mechanics, 845 at $52 to $84; engine wipers, 143 at $60; car cleaners, 90 at $60; steamer crews, 287 at $60 to $175; shipyard hands, 17 at $85 to $104; engineers, 394 at $85 to $145; firemen, 388 at $65 to $80; clerks and draughtsmen, 12 at $75 to $200; foremen, 79 at $105 to $200; mechanics, 570 at $60 to $85; watchmen, 50 at $55 to $60.

The Ophir Mine

From the report of the Superintendent of the Ophir mine we take the following:

Ore extracted, 3,878 1810-2000 tons, which has yielded $36,607.34 or at the rate of $9.44 per ton, being about 60 per cent of the assay value. This ore has all been taken from above the level of the old Central tunnel, Work in the levels, between the 1,600 and 2,700-foot, has been but light. Work has been carried on more extensively in the 2,900 and 3100-foot levels. In the former a drift has been run to the south line and continued by the California company. To facilitate the extraction of low grade ore, the upper workings have been repaired and retimbered. During the past few months the work has been confined to the working of the low-grade ore in the upper parts of the mine. The purchase of the Morgan Hill property will allow lower grade ore to be profitably worked. The report concludes: "When the main north lateral drift on the 3,100-foot level, between the Ophir-Mexican and Sierra Nevada-Mexican winzes is completed, the explorations in the 3,100 level should be resumed, as the late developments in the Mexican ground have demonstrated the fact that the vein, through which the Ophir-Mexican winze was sunk, is continuous and strong down to this point, indicating that something of value may be found on further exploration."

Superintendent's Financial Statement

For the year ending November 30th, 1883:

RECEIPTS.

Balance last year's report	$3,336.57
Salaries	58,847.00
Supplies and mining expenses	34,015.53
Office expenses	75.05
Drafts on President	297,353.36
Total	$393,627.81

DISBURSEMENTS.

Salaries	$167,985.16
Supplies, etc	154,674.35
Office expenses	595.45
Legal expenses	416.67
Water and ice	7,820.05
Taxes	3,349.42
Milling	25,995.64
Sutro Tunnel royalty	1,944.35
Morgan mill expenses	29,377.54
Exchange	751.50
Gross expenses	$392,810.13
Balance cash on hand	817.68
Total	$393,627.81
Gross expenses	$392,810.13
Received from other mines	92,937.88
Net expenses	$299,872.25

The Secretary's Report

Was as follows:

DISBURSEMENTS.

Legal expenses	$416 67
Assessment	377 00
Insurance	1,800 00
Supplies and mine expense	120,658 52
Office expense (Virginia)	520 40
Water and ice	7,820 05
Taxes	3,639 72
Freight on bullion	121 70
Reduction of ore	25,995 64
Sutro Tunnel royalty	1,944 35
Discount on bullion	2,475 87
Interest on exchange	926 05
Wages and salaries	109,126 16
Office expenses (San Francisco)	5,856 55
Morgan mill property	16,000 00
Morgan mill supplies	13,377 54
Superintendent's balance account, 1883	817 68
Bullion on hand (gold)	13,855 78
Bullion on hand (silver)	7,554 09
Total	$333,295 77

RECEIPTS.

Supt's. balance account December, 1882	$3,336 37
Cash on hand December, 1882	3,176 26
Bullion on hand December, 1882	12,610 07
Assessments (Nos. 43, 44, 45)	252,000 00
Gross bullion product	33,500 60
Cash overdraft (December, 1883)	28,661 71
Bullion samples	10 91
Total	$333,295 77
The Ledger balance shows a total expenditure of	$359,371 85
Receipts (assessments)	252,000 00
Gross product	33,500 60
General revenue and expenses	45,209 69
Cash	28,661 71
Total	$359,371 85

MENDOCINO COUNTY contains 2,000,000 acres all told, of which 64,000 are under cultivation, and 500,000 are timber land. Maximum price per acre, $100; minimum, $2; average, $10. There are about 1,000 ranches in the county belonging to about 800 owners. Maximum rent of land per acre, $15; minimum, $ 1; average, $2. There are about 10,000 miles of fencing in the county, costing $300 a mile. The maximum wages paid to farm hands per month, including board, is $30; minimum, $20; average, $25—said laborers finding employment during all the months of the year. The daily hours of labor range from eight to twelve. According to the Assessor's report, there is not one unemployed laborer in Mendocino county. Within the county bounds there are only twenty-five miles of railroad, and none of the highways are macadamized.

DURING the three weeks ending December 8th, 274 cars and 70 sacks of ore, bullion, lead and lead pipe, were shipped out of Salt Lake, amounting to 6,855,527 pounds.

MECHANICAL PROGRESS.

A New Heat Motor.

Mr. Bourne, C. E., the principal of the new Engineering College at Muswell Hill, England, and author of various practical works on the steam engine, has, we are informed, been engaged during the past year in perfecting a new species of heat engine which, it is expected, will supersede the steam engine for nearly all the purposes for which that is at present employed. It has long been known that the steam engine is a most wasteful machine, not more than one-tenth of the theoretical efficiency of the heat expended being obtained in even the best engines, the other nine-tenths being wasted. It has also long been known that power can not be generated by heat unless there be two unequal temperatures; and that it is in the act of falling from the high temperature to the low that the heat is transformed into power. The farther removed these two temperatures are from one another the larger will be the proportion of the total heat transformed into power; and it is because in the steam engine these two temperatures are not far apart that the heat is wasted to so serious an extent. The maximum temperature in a steam engine is the temperature of the steam, which may be 250° or thereabout; and the minimum temperature, which is that of the condenser, may be 100°; so that the total fall from the highest temperature to the lowest may be about 150. The power generated by this inconsiderable fall will not be great, any more than the power will be great which is got from a low fall of water by any hydraulic machine. But the conditions under which steam can be worked in an engine imply limited extremes of temperature, and therefore a large expenditure of fuel to generate a given amount of power. To enable higher temperatures to be employed in engines for the generation of power, air has been proposed as a substitute for steam, and air engines have been contrived by Stirling, Ericsson, Joule, and others. But the difficulty of heating the air by any species of air boiler, and of preserving the piston in a working condition at high temperatures has so seriously impaired the advantages of these contrivances that they have never come into extended use. Under Mr. Bourne's arrangement these objections are avoided. There is no air boiler, but the fuel is injected into a small chamber so that the heat is generated internally instead of being transmitted through heating surfaces. The maximum temperature employed is the temperature of flame. But the engine is so contrived that the piston is not subjected to any higher temperature than is usual in steam engines. It is stated that an engine constructed upon this principle may be made so compact and so light as to be applicable to many purposes for which steam engines cannot be used, such as flying, tramway locomotion, and the propulsion of tricycles, while the economy of fuel will be such, by reason of the high temperature employed, that a very inexpensive performance will be obtained.—*London Iron.*

Injury by Heat.

In some mechanical processes the production of heat by friction is a serious injury to the value of the time and the material employed and used. Machines must be cooled to do their work well, and parts which are particularly exposed to friction must be renewed frequently to keep the productive value of the machine intact. If means could be found to kill the heat at the moment of its generation, some mechanical processes would be forwarded, and others made more profitable. The hardest steel cannot withstand the disintegrating effects of heat by friction, even when the friction is produced by contact with a much softer metal. In the ordinary rivet machine, where copper rivets are made for belting purposes, the heading hammer is a cylinder of hardened cast steel. It strikes a blow against the end of a bit of soft copper wire, and instantly so much heat is evolved that not only is the rivet too hot to be handled, but the steel hammer is affected to almost as great an extent; at least, the repeated blows of the steel against the soft copper anneal the steel and rapidly destroy its integrity.

In the lathe turning of steel, and in the production of machine screws from the bar or rod, rapid work can be done by means of a constant flow of oil or of water; in some instances so high a speed as eighteen feet per minute has been profitably reached in the turning of steel when a constant stream of water plays upon the point of the turning tool. Still there are cases where, in turning, the depth of the chip prevents the cooling water from reaching the point of the tool; and in the case of the hammer blow of the rivet machine, the application of a constant stream of water or oil would seem to be inconvenient, if not impossible. There appears to be room for improvement and remedy in this department of metal working; possibly chemical contrivance may be successful where mechanical means have failed.—*Scientific American.*

THE TRANSMISSION OF POWER.—In a prize essay by Herr Beringer on the transmission of power for long distances, it is stated that electric and wire-rope transmissions (the latter up to a length of about two-thirds of a mile) are the best. Above that distance, electricity is to be preferred. The power of a hydraulic motor may be transmitted to distances of 12 miles without becoming more expensive than steam power generated on the spot. For electrical transmission another 6 miles may be added to the distance, so that in a locality where cheap water power exists machines may be actuated by electricity with advantage within a circumference of 18 miles. Beyond that distance, however, steam motors are more economical. If there is no water power, and the erection of a central steam engine becomes necessary, a wire-rope system works with greater advantage, and is only to be rejected in towns, because, in such cases, wire-rope traction loses greatly by the necessary branching off. The erection of a separate motor becomes cheaper where energy of 10 horse-power and above is required. Water and air are far exceeded by electricity for transmission of power, and if motive power is to be transmitted 6 miles from a central steam motor, it can be done economically only by electricity.

COST OF LOCOMOTIVE POWER.—The cost of locomotive power on the Grand Trunk Division of the Grand Trunk Railway of Canada, says the *Railway World*, was 12.06d. per engine mile in the first half of this year, as compared with 11.62d. per engine mile in the first half of 1882. The loss of engine power, owing to delays on the entire line, from snow, etc., during the first four months of the past half-year, as compared with the corresponding period of 1882, amounted to the use of 37 engines per day, continuously, for each 24 hours. The total increase in the cost of locomotive power in the first half of 1883, as compared with the corresponding period of 1882, was £37,406, or 13½ per cent. As illustrative of the increased difficulties entailed by the greater severity of the winter, it may be stated that engines employed in working snow-plows and ice-breakers ran 58,021 miles, as compared with 5,427 miles in the half-year ending June 30, 1882, showing an increase of about 970 per cent.

COVERING IRON AND STEEL WITH COPPER.—According to the *Metallarbeiter*, iron can be coppered by dipping it into melted copper, the surface of which is protected by a melted layer of cryolite and phosphoric acid. The articles to be coppered must be heated to the same temperature as the melted copper. Another process consists in dipping the articles into a melted solution of one part of chloride or fluoride of copper, and five or six parts of cryolite, and a little chloride of barium. If the article, when immersed, is connected with the negative pole of a battery, it hastens the process. A third method consists in dipping the article in a solution of oxalate of copper and bicarbonate of soda, dissolved in ten or fifteen parts of water, acidified with some organic acid.

ABOUT BELTING.—The horse-power of a belt equals velocity in feet per minute, multiplied by the width—the sum divided by 1,000. One inch single belt, moving at 1,000 feet per minute—1 horse-power; double belts about 700 feet per minute, per 1-inch width—1 horse-power. For double belts of great length, over large pulleys, allow about 500 feet per minute, per 1 inch of width per horse-power. Power should be communicated through the lower running side of a belt; the upper side to carry the slack. Average breaking weight of a belt, 3-16x1 inch wide—leather, 330 pounds; 3-ply rubber, 600 pounds. The strength of a belt increases directly as its width. The co-efficient of safety for a laced belt is, leather—1-16 breaking weight; rubber—⅛ breaking weight.

STEEL CHAINS.—Experiments are now being made at the Washington Navy Yard in the manufacture of 1½-inch steel chain to take place of the 1⅞-inch iron chain now in use. The difficulty heretofore encountered in manufacturing steel chain was the trouble experienced in welding it. The naval authorities have, however, succeeded in getting a quality of steel from Pittsburgh adapted to welding, a section of chain made from it having been tried recently in the testing machine and found satisfactory. A quantity of it will soon be issued to the United States vessels on the home stations and subjected to a practical test, and, if satisfactory, will probably be generally introduced in the navy.

ILLUMINATION OF STEAM BOILERS.—The lighting up of the interior of steam boilers was long ago suggested. It has lately been carried into practical operation by the Patent Steam Boiler Co., London. They arrange lights within the boiler in such a way that the cascades, currents and miniature whirlpools of the water may be clearly observed. It is believed that useful information will be derived from the observations touching the cause of priming, the best modes of separating steam from the water, etc.

STEEL CARS.—According to the Denver *Journal of Commerce*, the Denver and Rio Grande Company are contemplating the manufacture of steel cars in the near future. A sample car will soon be commenced at their shops in that city. It is intended to heat the car by steam and light it by electricity.

SCIENTIFIC PROGRESS.

Philosophy of Oil Calming Waters in a Storm.

At the recent meeting of the American Association for the Advancement of Science, Mr. E. P. Calverwell read a paper on "The Probable Explanation of the Effect of Oil in Calming Waters in a Storm." He said that when the surface of the sea had become quite smooth after a storm, it was very common for long rollers to break on a sand bar. If there were no wind and the sea glossy, these would not break until quite close to the shore, even though the ordinary theory pointed to their breaking earlier, unless a force directed in the opposite direction to that of their motion were exerted on the wave. Such a force might be supplied by the wind; but if it rose in any direction the waves broke much sooner. This effect was therefore due to some secondary effect produced by the wind pressure, and not directly by the pressure itself, and it was to the ripples produced on the surface (which disturbed the wave motion) that the speedy breaking was to be attributed. It was, however, a direct result of theory that the ripples depended on surface tension for their propagation, and could not exist in large amount on the oiled surface. It was also evident that the hold of the wind on the wave was greatly decreased by the absence of ripples, and thus the oil acted both to prevent the wind having much effect on the surface, and also to prevent the motion of the water in the wave being such as to cause breaking. The amount of friction might perhaps sensibly influence the breaking, but definite experiments on this were still wanting.

ALUMINIUM METAL.—This metal appears to be just coming into general use. It is now being extensively applied in the manufacture of field telegraphs and telegraph connections, large orders having been received from the British government. The application of the metal to jewelry, mathematical and musical instruments and the like is very greatly increasing. Twenty tons of goods, worth $150,000, made from the alumina metals were recently shipped from Liverpool to be shown at the Calcutta exhibition. Among the exhibits were screws, wire and other articles, pens and pencil cases, railway carriage fittings, locks and bolts, harness furniture in great variety, chandeliers, electro plate, cutlery and ships' fittings. These had been produced by firms in London, Glasgow, Leeds, Sheffield, Birmingham, Wolverhampton, and other towns. One of the most important characteristics of this metal is its almost absolute freedom from corrosion. The report of a late English commission appointed to inquire into the condition of four-bladed propellers which have been cast in it shows that the experiments have been quite successful, and that the metal is absolutely uncorrosive by the action of salt water. Mr. Webster and his process for its manufacture have both been subjected to considerable criticism since he formed a company a twelvemonth ago to develop his process. But the company has gone on steadily working, and they assert that they are now in a position to point to the remarkable success of the undertaking.

A NEW INSULATING MATERIAL.—According to an account in *Engineering*, Mr. E. T. Truman, of London, England, has brought out a new insulating material, consisting essentially of plumbago, or black lead, mixed with gutta-percha, india rubber or ozokerit. When the gutta-percha is of poor quality the proportions are 50 parts of gutta-percha and thirty parts of graphite; but the better the gutta-percha the greater the proportion of graphite, which can be used up to 50 per cent. The graphite, which must be very dry, helps, according to Mr. Truman, to preserve the gutta-percha. The black lead is chosen for its high insulation in the first place, then is carefully sifted, dried and mixed with the gutta-percha in a masticator or condenser. The resulting insulator is applied to wires by the ordinary machines for covering. Ozokerit may also be mixed with the compound in small proportion. A black lead surface of a protective character is also given to gutta-percha wires by Mr. Truman, and its lubricating surface assists in the manipulation of the wires in pipes.

WHAT BACTERIA ARE.—Dr. Rollin R. Grigg, of Buffalo, N. Y., after a series of experiments to ascertain the nature and characteristics of bacteria, bacilli and other creatures, whose existence is relied upon by advocates of the "germs theory of disease," as opposed to the disease theory of germs, has given the following as results and their explanation: By boiling a quantity of healthy blood he obtained all the forms of bacteria. Then with some pure fibrine, obtained from a washed clot of blood and boiling it, proving it was the threads of fibrine broken up into pieces and granules that gave the bacteria, the same results were obtained. Next some blood was obtained and rotted under warmth, and closely watched for two months; and here again all the forms were obtained that the fresh boiled blood gave. From these experiments Dr. Grigg concludes that all the bacteria of disease are forms of fibrine; and, for the general good requests all investigators to repeat the experimental work and report to the public the results of such investigations.

NEW TEST FOR OXYGEN ELIMINATED BY PLANTS AND ANIMALS.—Engelmann has devised the following ingenious test for oxygen, which is described in *Wiedemann's Annalen*. It depends on the fact that the bacteria of putrefaction do not move except where free oxygen is present, and, when the oxygen grows scarce, they collect in those places where there is still some free oxygen, as in air bubbles, etc. The advantages of the bacterial method employed by Engelmann for investigating plant assimilation consist chiefly in this, that it enables him to detect the smallest trace of oxygen to the trillionth part of a milligramme, and at the same time to determine with microscopic accuracy the places where the oxygen is given off. He found that only those cells which contain chlorophyl give out oxygen, and that only in the light. The action of light is strictly local; it begins the moment that light strikes it, and seems to cease instantly when darkness comes on.

SULPHUR PHOSPHORESCENT.—K. Neumann raises the question whether sulphur, selenium, arsenic, etc., are not, under suitable circumstances, capable of phosphorescing like phosphorus. He finds that when sulphur is heated on a metal or porcelain plate in the dark, the vapors suddenly become phosphorescent, burn with a bluish-gray flame, perfectly distinct from the ordinary fine blue flame of sulphur. The odor given off is not that of sulphurous acid, but resembles that of hydrogen persulphide, camphor, and ozone. The product of the combustion is doubtless a stage of oxidation lower than sulphurous anhydride.

THE MAGNETIC POLE.—Prof. Thompson, in a lecture at Glasgow, stated that the magnetic pole is now near Boothia Felix, more than 1,000 miles west of the geographical pole. In 1657 the magnetic pole was due north, it having been eastward before that. Then it began to move westward until 1816, when the maximum was reached. This is now being steadily diminished, and in 1976 it will again point true north. Professor Thompson says that the changes which have been observed, not only in the direction but in the strength of the earth's magnetism, show that the same causes which originally magnetized the earth are still at work.

CUTTING OFF THE HEAD NOT KILLING.—S. R. Canestrini has been experimenting on the effects of decapitation of insects. Butterflies were able to use their wings eighteen days after they had lost their heads. Crickets leaped on the thirteenth day after they had been beheaded, and the preying mantilla showed signs of life on the fourteenth day after the head had been separated from the body. He gives still more singular observations tending to show that the head in insects cannot be subject to the same perpetual strain as the head in mammals in guiding the motions of the body.

TRANSFER OF ENERGY BY ELECTRICITY.—In discussing Tresca's experiments at the Northern Railway station, the President of the Society of Civil Engineers remarked upon their great value. Even if a quarter of the original energy could be transmitted, there would be many cases in which a force could be transported to a distance, which it would be impossible to produce at the place where it is used. M. Cretien thought that the delivery would vary largely under varying conditions. He claimed personally to have transmitted 60 per cent in some cases, and even more.

LUMINOUS PAINT.—The latest useful application of luminous paint is referred to as follows: "Some useful applications have lately been made in England of luminous paint where it is desirable to render objects visible in the dark, such as life and mooring buoys, numbers of vessels, dangerous rocks and headlands, a large rock having recently been painted. Perhaps the most striking application is the painting of the mariner's compass on board ship, by which means it is rendered clearly visible, and the course can be easily kept should the lamp be extinguished."

A NEW INCANDESCENT LAMP.—There was recently shown at the Industrial Science Society of Lyons a new semi-incandescent lamp, giving the brilliancy of an arc lamp. It was made of two carbon rods, slightly inclined to one another, brought down on to a small prism of chalk, and separated from one another by a small rod of the same material. The current passes through the chalk rod, making it incandescent. By this means the light is rendered steadier than an arc light, and it is said to have the same brilliancy.

THE CHEMIST'S AID INVOKED.—A correspondent of the *Scientific American* asks: "Cannot the chemist, with the aid of non-injurious chemicals, assist us to improve on present methods for the clarification of raw and cold cane-juice, and so that it can be done without the aid of fire heat?" He suggests that the subject is of sufficient importance to our Southern planters to make it an object for them to call for a general consultation of our chemists in regard to the matter."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Calaveras.

SALT SPRING VALLEY.—Cor. of *Citizen*, Dec. 22: The quartz claims in Madam Felix mining district, Salt Spring Valley, and being energetically prospected with the exception of the Royal claim, which has hundreds of tons ready for milling. The owner is negotating with parties for the sale of this mine. The mine has a large amount of quartz assaying from ten to twenty dollars to the ton, with some going up into the hundreds. There is also an indefinite amount of low grade ore with abundance of sulphurets that assay well. The Pine Log and Etta claims are owned by wealthy men of San Joaquin county who have refused $35,000 for their mines. The workmen say that there is very good ore below the 100 level, and that the veins are large. The Hendricks & McCormick mine prospects to the satisfaction of the owners who are mining men of thirty years experience, and have the wit to know a good thing when they see it. The mine adjoins the Royal claim on the south whilst the Hilltop claim adjoins it on the north. There is a large number of veins throughout the district that have been slightly prospected and show some gold; but the group of mines spoken of is embraced within a distance of a mile in length by half a mile in width, showing many veins from less than a ft up to ten in width, which run parallel, with innumerable cross veins, forming a perfect network of quartz, appearing to be a concentration of mineral bearing rock in this particular region that has no resemblance to any found in the valley.

El Dorado.

REID MINE.—Placerville *Democrat*, Dec. 22: F. H. Goyan is pushing work on the Reid mine, and if reports are true he will soon be able to furnish an item that will be interesting to some of our readers that imagine that but little is being done in the mines of our county at present.

Inyo.

POTOSI TUNNEL.—Inyo *Independent*, Dec. 22: The latest advices are that the developments in the Potosi tunnel on the deposit uncovered two months since, are progressing favorably. A recent examination made at the end of the 30 ft drift running on the main lode, disclosed a body of fine ore. An incline shaft has been sunk on the foot wall at this point to a depth of twenty feet, in which the ore continues to show well.

NEW MILL.—W. A. Greenly is preparing to erect a 5-stamp gold mill on Cottonwood Creek, five miles above Piper's Ranch, Fish Lake valley. Mr. P. A. Chalfant is purchasing and shipping material and machinery, and informs us that, unless prevented by stress of weather, he will have the mill in operation early in March.

INITIAL RUN.—The Swansea furnace fired up on its initial run Monday, and ran successfully until Tuesday, when, by the breaking of a pump it was compelled to blow down. This was a most unfortunate accident, for it interfered with what promised to be a most successful run. A few days will repair damages, when the furnace will be again started. During the short run of the furnace 40 bars of bullion were run out.

ELNA.—The Elna furnace has not yet made its repairs, but will in a few days be ready to fire up. A large quantity of ore is ready for smelting, not only from the company's mines, but by shipments made from various points.

Mariposa.

CRANBERRY MINE.—*Gazette*, Dec. 22: This mine, on the Main river, two miles above Ferguson's, has a promising outlook. Craig & Co. have completed a water ditch one and a half miles long, which terminates at the old Rutherford mill site. The ditch is 2½ ft wide at the bottom, and two ft deep. The ditch is expected to afford ample power to run two arastras, which are about ready to start. The mine is about a mile off from the arastra on the mountain above, from which point the ore will probably have to be conveyed by tracks or sleds as the mountain is quite precipitate.

FERGUSON.—This mine has closed its operations for the present. It was leased to Joseph Opie and others for the past year, who have not made a success. The mine has a 10-stamp mill, a compressor, and other valuable machinery, and it is to be regretted that ore sufficient cannot be struck to warrant a continuance of its workings.

QUAIL MINE.—Cor. of Coulterville *Herald*, Dec. 21: They have a splendid chute of 60 ft in the tunnel which continues in the level, showing as large a vein at the end of the tunnel as any other portion of the mine. They are now making a raise to break into the old works above, and are up 60 ft, the vein showing a uniform thickness and all showing free gold to the naked eye. It is the most uniform and pretty lot of ore I have seen for many a year, and I am satisfied from what I have seen of the vein and of the rock on the dump that it will average $20 per ton.

SCANLON'S PLACER CLAIM.—John L. Scanlon has a 2½ inch galvanized wire rope 300 ft in length, spanning the North Fork at the mouth of Gentry's gulch, with a ten-inch iron pipe laid across with 14 ft wall. This will carry the water of said gulch to a bar opposite, that contains from fifteen to twenty acres, all of which will pay well for working. He has made wages for four years by drifting and wheeling the dirt from this bar, and with the facilities he now has can make big wages and it will last him his lifetime. It is one of the best appointed claims in this county.

BUENA VISTA MINE.—The O'Gorman's are pushing the work on their mill. They have been, and still are, retarded in their labors by the lack of carpenters, but are doing extraordinary well under the circumstances. The main building of the mill is already completed and ready for the introduction of the machinery, all of which is now on the premises. The mill will be in full blast in about three weeks.

SWEETWATER MINES.—The Grove Brothers are now running their new 10-stamp mill on ore from the Gordon & Simpson mine, formerly owned and worked by Nat. Harbert. Ferguson & Rice, half owners of the old Early mine, are grading to a mill site on Sweetwater creek, a half mile below the mine, at which place they propose erecting a mill next spring. They have ore enough on the dump to pay for the same. There is about 80 tons of ore on the dump at the Mountain View mine, owned by the same parties, which will pay handsomely for crushing.

Mono.

STANDARD CON.—Bodie *Free Press*, Dec. 18: There were extracted and shipped to the mills 1,366 tons of ore; 1,870 ounces of crude bullion were received and $18,048 shipped to San Francisco.

MAY LUNDY.—Homer *Index*, Dec. 22: Affairs at the May Lundy mine are progressing about as usual, some 20 men being employed underground. Teams and pack mules continue to transport from 13 to 15 tons of ore per day, and all the ore being extracted is of very high grade. The mill is being run day and night up to its full capacity, there still being several hundred tons of ore in the mill yard.

Nevada.

EUREKA MINE.—Grass Valley *Miner*, Dec. 21: The prospecting operations which have been going on upon the old Eureka mine for some months are giving good encouragement. A shaft has been sunk to the depth of 105 ft and a drift run to the northwest 125 ft, where the ledge shows a size of over two ft, and looks well. This drift is entirely in new ground, following a split that went off from the main ledge at the time the mine was worked years ago. There is a probability that a new mine will be opened by means of this prospecting operation within the Eureka location. It is the intention now to put up regular hoisting works over the new shaft.

LITTLE DEER CREEK.—A two ft ledge of very good looking ore has been struck in the Coe claim on Little Deer creek. Ed Moore owns the adjoining property and he has a very rich but not large ledge.

NORTH BLOOMFIELD CO.—The North Bloomfield Co. is now working about 70 men in the hydraulic mine, and have a fine bank of gravel ahead.

Placer.

A '49 STRIKE.—Placer *Herald*, Dec. 22: We learn that a regular '49 strike has been made at Alabama Bar, a few miles above Michigan Bluff, on the south fork of the middle fork of the American river. The mine, in which local parties were formerly interested, is now owned by a San Francisco company. It has paid some for years, though not so much but what when Matt Hazlett sold his interest some time ago at a rate equal to $10,000 for the whole, it was thought he had done well. Now, with a bank of only 6 or 8 ft deep and plenty of free water, they are taking out from 2 to 3 ounces a day to the man. The strike caused some excitement in the neighborhood and induced parties to prospect the river further up, where it was heretofore supposed to be barren. At a point about three miles above Alabama Bar a prospect was got of $9 to seven pans of dirt. This tended to increase the excitement and already the river is staked and claimed for miles, and lots of work and lively times are looked for in that section with the opening of the coming spring.

Plumas

ARCADIAN.—Greenville *Bulletin*, Dec. 15: The Arcadian is developing into a good mine, especially in the lower Sunset. A drift has been run 100 ft upon the ledge in the Sunset; 80 ft of this is 3 ft wide, the last 20 ft is 5 ft wide, and that is the present size of the vein in the face of the drift. All of this distance is in good pay ore. The present depth of backs is 80 ft, but as the drift it running directly into the mountain this depth is constantly and rapidly increasing. Two other chimneys are known to exist upon the ledge; they crop out on the surface some hundreds of ft beyond the present face of the drift. The present prospect for the Arcadian is good.

GREEN MOUNTAIN.—The drift on the ledge at Green Mountain continues to make steady progress. A few weeks more will carry the drift into the Blake chimney and then the amount of ore that may be had will be limited only by the amount that is wanted. The waste rock from the drift has been run out toward the mill, till a way is nearly completed from the mouth of the tunnel, so that when the chimney is reached the ore cars can be loaded where the ore falls and run right into the stamps.

RIVERDALE GRAVEL MINE.—Quincy *National*, Dec. 15: The shaft, after striking the rim, was continued down some 20 ft, and a drift started to the west to tap the channel. This drift has been run just under the channel for 70 ft, and on Monday morning last the gravel broke in at the top. A connection has been made with the drift from the Meylert & Hughes shaft, the water drained off, and the mine is now in a splendid condition for opening. That it will prove extraordinary rich is almost a certainty, as it is the outlet of all the rich channels which made Elizabethtown so famous in the early days of Plumas

San Bernardino.

BISMARCK.—Calico *Print*, Dec. 22: Mr. J. B. Whitfield, foreman, says: "The mine is doing everything that can be expected. We are shipping ten tons of ore each day which averages $100 per ton. We have a body of ore 300 ft wide and 400 ft long. We have been running the mine since the middle of September and are striking richer ore as our property becomes more fully developed. We mill our own ore and realize a reliable profit on every ton shipped. The ore lies in what is known as a blanket ledge. We have worked out to a depth of 14 ft. We have also sunk on the hanging wall of the same body of ore and find our ore richer as we go down."

HUMBUG.—Messrs. Reed Bros. claim for their mine the supremacy; they say of it: "We have just sampled a lot of our ore on the dump and it averages $105 to the ton. We have about 3,000 tons in sight and see no end or bottom to it. Within the past few weeks we had 130 tons milled which yielded us $72 per ton deducting all expenses. This lot was sent to the mill just as we took it from the mine without sorting. Our body of ore contains about one-fifth waste but our ore is rich enough to allow us to do away with sorting and still yield us a handsome profit.".

KEARSARGE.—We have been working the mine for a year past and are now takidg ore that assays $200 per ton. We will ship 40 tons in a few days which consists chiefly of rich chlorides and horn-silver ore. Our mine is doing as well as we could wish for. Our ore lies in a blanket vein and a shaft which we have lately sunk 30 ft fails to show us any bottom to it and we have ore in sight from end to end of our claim."

Sierra.

CHEROKEE CREEK.—Downieville *Tribune*, Dec. 20: J. J. Williams from Brandy City last week exhibited several pieces of rock that showed gold quite plainly. The ledge from whence the rock was taken is on Cherokee creek, near Brandy City. The huge ledge of dark colored rock, resembling bedrock, was passed and repassed for years by Williams without the thought once entering his mind of looking for gold in it. A short time ago, he picked up a piece of the rock and found gold sprinkled over it. Following up this discovery he encountered still better prospects that led him to locate the ledge. A sample sent to San Francisco assayed $159 per ton.

GRAND PRIZE.—The Grand Prize Co. proposes to begin the work of development in their claim shortly. A tunnel will be started that is expected to tap the channel in about 1,500 ft. The Grand Prize ground is located above Poker Flat, and adjoining the Bunker Hill claim. The principal owners reside in this place and Forest City.

BALD MOUNTAIN EXTENSION.—The Bald Mountain Extension Co. cleaned up 66½ ounces of gold Sunday from three days washing of gravel taken from the South Fork ground. The total yield of the week was 119½ ounces from 741 car-loads of gravel washed. The gold is coarse. One piece weighing 5 ounces was picked up last week.

BRANDY CITY.—The new tunnel at the Brandy City mine has been run between 400 and 500 ft. The Burleigh drills will be put at work in a short time. A large crew of men finished repairing the Hoosier flume last week. Everything is now in readiness for doing a big season's work at the mine.

RUBY.—The Ruby Co. is still taking out good pay. The extent of the channel is not yet known, although they have so far opened out that they could put on 20 more workmen if they had water.

Trinity.

A BIG FIND.—*Journal*, Dec 15: Mr. Isola was in town from Deadwood this week told us that he has recently discovered a six-ft ledge lying on the ridge between Frick & Davis and Lambeth's locations, which is destined to be the biggest thing in the State. Tests made of the rock go above $200 to the ton.

WORKING AWAY.—We learn from Supt. Benjamin that work at the head of Canyon Creek ditch will be suspended for the season next Monday, at which time the water will be turned through into Guthrie's mill ditch. The saw-mill is being run night and day.

EASTMAN DISTRICT.—Some time ago Mr. C. Hickey took out about all the good quartz there was in sight in his mine in Eastman district, but he knew where he could strike it again. He went for it a short time ago and the result is that he struck the ledge good sized and going $200 to the ton.

LEWISTON.—Mr. Thos. J. Blakemore, who was in town last week says that one of the workmen called his attention to a 4-inch streak of decomposed quartz about the center of the ledge. Mr. Blakemore took a handful of the "stuff" home with him, and weighing it found there was a little more than 12 ounces. This he pounded up and amalgamated in the mortar and from it obtained $6.60 in gold.

SPLENDID SHOWING.—*Journal*, Dec. 22: The Blakemore mine continues to show splendid prospects. Mr. J. W. Blakemore informs us that they now have 300 tons of rock out most of which will go $100 to the ton and they have 27 tons of selected rock at the lower arastra which will average not less than $250 to the ton. The tunnel is now in a distance of 156 ft—100 ft deep at the shaft—and the pay chute has not been crossed, while the ledge above them varies in width from two to seven ft.

Tuolumne.

LAMPHIER.—Sonora *Democrat*, Dec. 15: Last week it became necessary to shut down the works at the Lamphier mine on account of needed repairs to the boilers. The delay was made longer by the necessity of having to send to San Francisco. In a few days everything will be in readiness and the mill and hoisting works will be started up.

TIOGA AND MOUNT GIBBS.—A gentleman recently from Tioga thinks there will be lively times up there next year. The Great Sierra Co.'s mines are looking well, and the mines at Mount Gibbs, four miles from Tioga, are showing up splendidly. The Deer Lodge and Jefferson, two mines belonging to R. A. Sawyer of Groveland, are said to prospect magnificently. The ledge of the Jefferson is 5½ ft wide, and shows a fine body of high-grade ore. In the Deer Lodge there are four distinct veins, running from 3 to 12 ft in width, and all show good ore, assays going as high as $750 per ton, mostly in silver.

NOTES.—Encouraging news comes from Spring gulch, near Groveland. Drumming brothers and John Marconi have recently struck some good pockets. The Drumming brothers have a deposit of very rich clay, which will pay big if they can get water to wash it. The 8-stamp rotary Sweepstake mill has been completed at the Stockton mine, and has been started up. It runs easily, and does good work crushing so far. Some very rich rock has recently been taken from the mine. The Garibaldi mine has been shut down for the present, the new Huntingdon crusher recently put up not proving successful.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Enterprise*, Dec. 22: On the 3100 level a crosscut has been run east from the station on the east side of the joint winze a distance of 24 ft, following some ore seams that made off in that direction. Now they have started the main northeast drift into Sierra Nevada ground. The first round of holes was fired yesterday.

HALE AND NORCROSS.—Work has been interfered with during the week, on account of the breaking of the rod of the Cornish pump at the Chollar-Norcross-Savage shaft. Enough water found its way up the 2600 drift to flow into the winze and put a stop to work at that point.

UNION CON.—The main south drift on the 3100 level is being pushed 20 ft per week. The drift coming north is making good progress. There is some water coming in at the face.

YELLOW JACKET.—Less than the usual quantity of ore is being extracted, owing to the low stage of water in the Carson river. However, steam power will probably soon be put in use at the Brunswick mill.

COMBINATION SHAFT.—Owing to the breaking of the rod of the Cornish pump, work has been delayed this week, as pending repairs, the water came up on the 2600 level.

IMPERIAL.—Good headway is being made in the main west drift going out to tap the old upper levels of the group of mines commanded by the Imperial shaft. The drift now has but about 100 ft to go to reach the old workings.

ALTA.—The mine has been drained, and the drifts on the 2150 level are now being cleaned out. All the machinery is working well.

OPHIR.—About the usual amount of ore is being extracted from the 150 level. The repairs to the drift and upraise on the 1600 level have been completed. The last shipment of bullion amounted to $21,409.87.

GOULD AND CURRY.—The usual progress is being made in the joint Best and Belcher winze below the 2500 level. Some water is coming in at the bottom.

BEST AND BELCHER.—Good headway is making in the joint Gould and Curry winze below the 2500 level.

MEXICAN.—The repairs to the drift and upraise on the 1600 level are completed. On the 3100 level the work of timbering up and cutting a drain in the north drift is progressing.

UTAH.—Good headway is being made in the north drift on the 1750 level, and it is now out about 80 ft. The ground is favorable.

ANDES.—There have been no special changes in either the north or south drift during the past week.

BELCHER.—Some ore is still being extracted, but the very low stage of water in the Carson river is again interfering with milling.

CROWN POINT.—Less than the usual amount of ore is being extracted, as low stage of water in the Carson river prevents.

CALIFORNIA.—The joint Con. Virginia winze on the 2700 level is going down at the usual rate of speed.

SCORPION.—The west drift on the 500 level continues in the same material as at the last report.

UNION SHAFT.—The work of easing timbers and repairing at the 2300 station goes on as usual.

CON. VIRGINIA.—The joint California winze on the 2700 level is making the usual progress.

OVERMAN.—Are taking out some ore from the ground in the upper levels.

Argentine District.

The Reno *State Journal* of Dec. 15, quotes from the Carson *Index*, as follows: There is no doubt that in the country west of Mount Davidson and between that point and Washoe City, there is a vast mineral region that in time will develop into a splendid system of mines. Were the Sutro tunnel extended westwardly from its present terminus 3 or 4 miles, it would penetrate a wonderful country. Mount Davidson itself is but a monstrous upheaval in the midst of an immense mineral formation which is as extensive and valuable west of that prominent peak as eastwardly. We find that in the hills east of Washoe there are numerous prospectors and many locations of mines. Our exploration was induced by the operations which have been carried on for the last year or two at the so-called Harris mine, three miles east of Washoe City. In fact, the present operations are but a renewal of explorations which took place in those localities years ago, and which failed only through the demand for quartz fully as rich as that which was realized from the "Comstock." The Harris mine is only at a more than usually promising point in the midst of a vast quartz formation which is not even limited by Mount Davidson, four miles to the eastward. Locations and sales of mining ground are constantly going on. The outlook is a most promising one.

RICH ORE.—*Silver State*, Dec. 18: Senator Marker and a man named Harris have discovered, within a few miles of Washoe City, what is believed to be another Comstock. The lead, as far as prospected, carries free gold, and two small sacks of ore from it sold in Virginia City for $1,300.

Belmont District.

BELMONT MINE.—Following is the official report from *Courier*, Dec. 15: From the winze below No. 1 level Laity ground we have started a drift which shows very good ore. Shaft in Moore & Martin ground, now 84 ft deep, shows a two ft ledge standing nearly perpendicular, with good black metal and chlorides. Winze from South Tunnel yielding the usual quantity of black metal. All stopes on 200 level looking splendid, yielding first-class ore. In No. 2 stope we have encountered very rich black sulphides with the ledge widening.

Bullion District

LANDER COUNTY.—Eureka *Sentinel*, Dec. 5: In Bullion district, separated from Campbell district by Indian creek, the mines are well defined and regular veins. The value of the precious metals in the ores runs from $300 to $700 in silver and about $9 in gold. They carry about 10 per cent lead. The principal mines in Bullion are the Lady of the Lake, Ivanhoe, Miner's Home, Radow and Rainbow, owned by the Bullion Mill and Mining Co., a private San Francisco corporation, the stock of which is nearly all owned by L. Radovich and Dr. L. C. Frisbie. This company have lately erected and finished a five-stamp mill. Everything is in perfect running order, turning out bullion from seven tons of ore daily.

Esmeralda District

SILVER PEAK.—*Herald*, Dec. 15. The large mining district surrounding Silver Peak that has so long been idle is to be awakened by the sound of falling stamps soon. John Chiatovich of Silver Peak has leased several of the mines owned by the New York and Silver Peak Mining Co. The 5 stamp, Lodi, Southern Belle mill, will crush the ore, and should developments be made, under this lease the work will be carried on extensively.

ESMERALDA COMMERCIAL CO.—The several

claims of this corporation, on Cat creek and vicinity, are gaining in value. As work on the Bull of the

Paradise District.

PARADISE MINE.—*Silver State*, Dec. 10: A 12-pound chunk of ore from the Paradise Valley mine, brought down by Charles Kemler, may be seen at this office. It is said by Mr. Kemler and others who have been in the mine, to be an average sample of a body of ore 5 ft wide in the Paradise mine, and it will assay over $3,000 to the ton. All who have seen this ore body say it is the largest and richest ever found in Paradise mines.

Peavine District.

GOLDEN FLEECE.—Captain Griffin informs the Reno *Gazette*, Dec. 14, that the Golden Fleece, which, owing to a break in the tunnel, was obliged to run around it for a considerable distance, has now such prospects as to render the stockholders very sanguine, and he himself feels sure that Peavine will turn out one of the finest mining districts in the State. Woods progresses, the ledge increases in size and richness. Everything in and about this mine is being placed in first class condition to insure profitable developments this winter. The mill will be overhauled and put in complete order, preparatory to starting up on ore from the mine. This week while grading a place upon which the boarding house is to be erected, a hidden ledge, 4 ft wide, rich in free gold, was uncovered.

Ploche District.

MENDHA MINE. *Record*, Dec. 15: About 90 ft from the surface is where the late body of ore was discovered. There were several miners extracting ore. Of course it is impossible to guess as to the extent of the ore body, but, where ore had been extracted, it showed the vein to be fully 13 ft in width. The men keep three teams hauling ore. The ore is a carbonate, with a goodly quantity of bright galena sprinkled through it. In sinking the shaft, this body of ore was cut through, and how it happened not to have been observed does appear strange, for we noticed on the opposite side of the shaft the same ore with bright galena all through it. The ore that has been shipped to the furnace from this mine up to December 1st averaged $126 in silver.

DAY MINE. The Day Co. recently purchased the old Hamburg mine, and have three men employed prospecting it. In early days the mine yielded some very fair ore. There is no reason why it should not do the same again to-day, and with a little prospecting, like the Mendha, it may again be made to give up its precious metal. The furnace at Bristol is undergoing a thorough overhauling so that when it starts running there will be no cause for stopping. Foreman Richard Walsh is engaged in relining it and making all necessary repairs. The bins are all filled with coal and the teams are hauling ore. Everything is being got in the best condition for a long and steady run. The furnace will start up about the first of next month.

KINGFISHER.—The ore is developing grandly. The ore recently encountered on the tunnel level is now six ft in width. The last assays had, made by J. C. Lynch, of the ore on the tunnel level showed 48 per cent lead and $57 in silver. Pointers all indicate that an extensive body of ore will be developed soon. The sinking of the shaft is being pushed ahead, and ore continues at the bottom.

Pyramid District.

A BRICK.—Reno *Gazette*, Dec. 18: Chamberlain had a chunk of purple ore from Pyramid lying on his counter last week weighing just 18 pounds. He got Thomas Price to reduce it, and this morning brought home a red brick containing 74 cents in gold, 56 cents in silver and enough copper to make it weigh 73 ounces. That makes the ore worth $151 in gold and silver, and $100 in copper per ton.

Tuscarora District.

ARGENTA.—*Times Review*, Dec. 18: South cross-cut on the 400 level is in 19 ft.

GRAND PRIZE.—South drift on the 400 level in 206 ft. Stopes are producing usual amount of ore. Shipped $7,000, for the week.

BELLE ISLE.—Work underground for the past five days has been suspended, on account of the repairs being made at the main shaft.

NORTH BELLE ISLE. The usual progress has been made with the crosscuts on the 300 level. No change to note in the stopes. Average battery assay, $162 per ton.

ELKO CON.—The main crosscut on the 200 level has been extended 12 ft, being now in a distance of 42 ft.

INDEPENDENCE.—Main drift north has been extended 12 ft, total, 928. No. 4 crosscut advanced 17 ft, total length, 70 ft. No. 1 crosscut extended 31 ft, total, 168 ft.

NAVAJO.—During the past five days the repairs in the hoisting engine has necessitated the suspension of work underground. The repairs will be completed and work resumed to-day.

CENTRAL CON.—Have reached solid ground. Distance to bottom of old shaft and sump, 79 ft. Formation has changed from granite to soft porphyry in the last two days, and is splendid working ground.

ARIZONA.

CASA GRANDE COPPER MINING CO.—Globe *Chronicle*, Dec. 15: The Copperosity group of mines have been sold to W. B. Hellings, who represented San Francisco parties, for the sum of $57,000. They are 35 miles due south of Casa Grande. The group consists of the Copperosity, Welshman, Little Chief and Copper Giant, all being on the same vein. The four claims take in 5,200 in length by the usual width of 900 ft. Ore crops continuously for 4,500 ft on the vein. Its immense size and the enormous quantity of ore in sight stamps it as the mother vein of the district. From the bottom of a 50 ft shaft, on the Welshman, a crosscut has been run 40 ft, passing through 27 ft of ore that will average 14 per cent copper. This is the average result of over 50 assays made by Mr. Hellings. Mr. Hellings accepts the superintendency from the purchasers, who will incorporate in San Francisco as the "Casa Grande Copper Mining Co."

CENTENNIAL SWEPT AWAY.—*Miner*, Dec. 14: Robert Stein of Centennial Mining Camp, which is south of Cullen's Well on the Erenberg road, writes James Daly that on the 5th inst. a body of water came through the valley, caused by heavy rains, washing away the entire camp, those living there escaping by climbing into the mesquit trees. Ores were being worked by arastra process, and some of the parties were about to clean up, but the pulp was swept away by the river of water, which so unexpectedly put in an appearance.

TOMBSTONE.—*Epitaph*, Dec. 16: Tombstone has passed its turning point. Work in our large mines below the water level, has been commenced, which, with the large reserves of ore in the upper level will materially increase our bullion output. The question of handling the water is solved, the Contention pumps alone, being sufficient to drain the mine, at present running at less than half their full capacity.

CONTENTION.—All the machinery works admirably. Here everything went from the first like clockwork, and a stranger, if present at the starting last Monday, would never have known if not told so, that it was the first trial of the heaviest piece of machinery ever put up in Arizona. The mine was perfectly drained in about five hours, after which the pumps were run at less than one-half their speed.

OLD DOMINION.—*Silver Belt*, Dec. 15: Old Dominion shipments for the week: Bars of copper 437, pounds 127,405. A new thirty ton smelter has just been received and the company will soon have three furnaces in operation. They have shipped 50 tons of ore to Pope, Cole & Co., Baltimore, to test the petroleum furnace at their works.

COLORADO.

EMPIRE.—Georgetown *Miner*, Dec. 15: George Barrett is fitting up the old Knickerbocker mill in good shape and will soon start up with 20 stamps. D. S. Lambert & Co., fixing up the Bay State mill, at the forks of Lyon gulch—16 stamps—will start in 2 weeks on their own quartz. The Pioneer mill and mine at North Empire is liable to be started up soon by Col. McLane. Before one knows it the mill will be pounding away. There is still some talk of the Neath mine starting up between now and spring, with a new engine, pump, hoisting works, etc. Our little Chilian mill down at the station, is still rolling away successfully. The New York and Colorado company's mill, 3 miles above Empire on the Middle Park wagon road, will start up in a few days with its 50 stamps and 10 Frue vanners. As soon as the mills start up the mines will start, then come the gold retorts of old. The Cashier, the Empire City, the Americus, the Windsor, the New Discovery, Neath and other mines, on Covode mountain, the Tenth Legion, Pioneer, Tenth Legion Extension, Grand View, Colorado State, Murphey, Gold King and others, on Silver mountain, all known to be good lodes, will start up with the mills.

LULU.—Gillette & Co. have run 350 ft on the Carbonate lode. There are also shafts sunk at intervals so that the total workings amount to 500 ft. They have a fine body of quartz, thickly interspersed with galena and yellow copper. Specimen assays have run as high as 300 ounces.

NOTES.—*Courier*, Dec. 13: The Silver Link mine, Sherman mountain, is yielding some good ore, which mill-runs, first-class, between 300 and 400 ounces silver per ton. Thomas & Matthews, lessees on the Vulcan, have a streak of ore from 6 to 8 inches wide, which mills, in one class, 100 ounces silver per ton. Conway & Co., lessees on the Little Emma, on Democrat mountain, had a mill run this week of over a ton of first-class ore, which run 1200 ounces silver per ton. About 7 tons of second-class run 300 ounces. Wm. Lynn, of Silver Plume, has disposed of a claim situated in Lincoln district, to Mr. Mackey for $2,000. A 75 ft shaft has been sunk on the claim, from which ore has been taken that mills over 2,000 ounces. The Burleigh Tunnel Co. intends driving the tunnel ahead soon. It is now in a distance of over 2300 ft, and within 900 ft of 7:30 group of veins, the cutting of which will no doubt open up a large and rich body of ore.

IDAHO.

ATLANTA.—Wood River *Times*, Dec. 12: The Last Chance mine at Atlanta, the property of the Atlanta Hill Gold Mining and Milling Company of New York, has closed down. The closing was a surprise to everybody. The mine is in better condition than it has ever been, large amounts of rich ore being in sight. The Supt. can give no reasons for this move. He laid in six or eight thousand dollars' worth of supplies, and large amounts of timber, lagging, wood, etc., engaged men to work all winter, and made every preparation for active work. All this was done on the company's orders. This is very hard on the camp, the men who were engaged having moved up the hill to the mine, laid in their winter's supply of provisions, wood, etc., all at considerable expense. The Co. has not yet paid off for October, and this, in the face of the success the Co. have had under present local management, looks very bad. The mine has been put in excellent condition and nearly $30,000 in gold bullion has been shipped to the New York office—all of which is largely in excess of the expense.

SILVER BULLION.—Ketchum *Keystone*, Dec. 15: Mr. Popham came into the office yesterday with a handsome chunk of ore from the Silver Bullion. It consists of chlorides and black carbonates, and assays 256 ounces. The vein in the Silver Bullion averages 14 inches in width from one end of the main tunnel to the other, and the ore is chiefly such as shown us. The outlook is fine.

NOTES.—The Independence, worked by Messrs. Ried Bros. and Johnson, is looking well. Recent samples of the ore taken from the breast give an assay value of 60 ounces for the very lowest grade, and over 200 ounces for the best. The Elkhorn employs two four-horse teams hauling ore to the Philadelphia smelters. The Ontario mine is looking splended. Over two ft of high grade galena is followed in the main works. The Blue Cloud group, owned by Wm. Harris, will be put on the market this winter. The Noonday tunnel is driving away at a lively rate. The Imperial has laid in winter supplies. Gillette & Co. are working the Ida Harland. About eight inches of solid galena has been found, and the claim is said to be looking immense. Four men are at work on the Independence and two on the Silver Bullion.

FOREST KING.—*World*, Dec. 11: Jas. Moriarty, Jr., one of the owners of the Forest King mine, informs us that they have run 36 ft into the ledge since tapping it and are now, he thinks, close to the footwall. They have a fine body of ore, and the mine makes a good deal better showing at this depth—320 ft—than in the old works above. The ledge matter is solid and firm, and the tunnel has not been timbered beyond the point where the ledge was tapped. Work will go on in the mine all winter. The Forest King is now opened up in good shape. We have no doubts that this mine will turn out big piles of the yellow metal and enter the list as one of the rich mines of Idaho.

COEUR D'ALENE.—Bodie *Free Press*, Dec. 19: Intelligence was received here yesterday from a trustworthy source, that the Coeur d'Alene mines will turn out to be really good, though perhaps they will not come up to the wild representations of some. The writer says the village of Hayes City consists of 40 or 50 log cabins and contains about 250 people. There was 2½ ft of snow on the ground when he left on November 25th. Mining was still carried on to some extent and more or less work would be done the entire winter. On Pritchard creek above the town, good claims have been discovered for ten miles. Some good prospects have also been discovered in 5 or 6 side gulches and sales have been made at prices ranging from $100 to $800 per claim.

Several quartz claims have been located which show high-grade ore, but very little work has been done on them on account of the deep snow which renders it impossible now to get into the mountains to prospect for quartz. Regarding the placers, he says the gulch is very wide and flat, running from 40 to 80 rods wide and having a fall of from 2½ to 3 ft to the 100 ft, the entire flat being heavily timbered. It is impossible to say how much dust has been taken out. The claims were first taken up by Palouse farmers; but few miners came in until late. The snow is deep, timber thick and the river must be crossed over thirty times between the mission and the mines.

The writer adds: "It will be a big camp. If a main pay channel is developed, in my opinion, it will be a better camp than Alder gulch was in its palmiest days. It prospects as well or better on the sides than Alder gulch did, and the gold is coarser. There are 14 miles of the gulch, besides the side gulches, affording ground enough to support a large camp. The bedrock is slate, with the gold in the crevices, and it will be hard bedrock to clean. There will be a grand hegira in the spring from all sections of the coast, and from my experiments with placer excitements, it would not surprise me to see 50,000 people in the diggings next season. Grub was getting a little scarce. About the most plentiful and the cheapest article was whisky, all the stores keeping it at two bits a drink. The restaurants furnish meals consisting of bacon and beans with coffee in a tin cup at $1 a meal."

The Walla Walla *Union* of Dec. 8 says: C. C. McCoy, of this city, has made all the necessary arrangements to start within a few weeks a well equipped line of daily stages between Rathdrum on the line of the Northern Pacific and the Coeur d'Alene mines via the lake. Mr. McCoy has already received the contract for carrying the mails and he has made arrangements with the O. R. & N. and N. P. companies whereby through tickets can be purchased to the mines. The stages will be thorough-brace coaches with four and six horse stock attached. The route chosen will give passengers a stage ride of a few miles to Fort Coeur d'Alene, from thence a steamer will convey passengers to the head of the lake when coaches will be again used. It is by far the easiest and shortest route and from the reports of the Pacific coast press we are of the opinion that Mr. McCoy will have to put on a double daily to meet the requirements of travel before spring closes.

The Kootenai *Courier*, of Rattledrum, Idaho, says: For months it has been known positively that gold and silver in almost inexhaustible stores are to be seen in the Coeur d'Alene gold fields. That the average yield of the placers per day to the man is from two to five ounces of gold is not controverted. Not less than 3,000 miners have visited this district during the past six months, and there is but one opinion—"rich beyond a shadow of doubt." This is not mere idle rumor, but the writer of his own knowledge—having made two trips to the gold fields—would be willing to make affidavit that at least three claims yielded not less than two and a half ounces per day to the man; and farther, that two of these claims were employing from seven to eleven men.

MORE.—Wood River *Times*, Dec. 12: H. W. Stoddard, left here six weeks ago for the Coeur d'Alene region, and returned this morning. From Hailey Mr. Stoddard traveled by rail to Rathdrum, on the Northern Pacific; cost of fare, $85, besides meals; from Rathdrum it costs $1.50 on the stage to Lake Coeur d'Alene, and $2 to cross the lake on the government steamer, which was still running. To the north fork of the Coeur d'Alene river is 60 miles. To reach this point the river has to be forded 25 times, and the water in the river is so high that the animals must swim at every crossing. Mr. Stoddard thinks that it will be a huge mining country; and he will return in February next, and attempt everything to get in. He is an expert snowshoer, and, as he knows the road, expects to get through all right. Transportation facilities are out of the question, as not even Indians can travel in that country in winter. But he wants it distinctly understood that he does not deem it advisable for anyone to attempt to get in before next April.

MONTANA.

BELL MINE.—*Inter-Mountain*, Dec. 17: A few days ago a magnificent ore body was penetrated, the estimated extent of which has been confirmed by subsequent exploration. Associated with a wide vein of second and third class ore, an ore body of high grade has been discovered. Its width is reliably reported to be 8 ft. It occurs as a massive copper sulphide assaying from 50 to 76 per cent, much of it being a pure copper glance. Thus far the silver assays have averaged $65, though samples of ore of wonderful grade in silver have been put through the assay furnace. It will require several days yet to determine the full extent of the strike.

MOULTON.—*Inter-Mountain*, Dec. 15: A very promising body of rich ore has been discovered on the 400 ft south vein, 700 ft west of the main crosscut. The ore was followed by a winze from the 300 almost to the 400 ft level. The new strike, in places, is over 4 ft wide and of excellent grade. From the 400 ft level a winze has been started with the view of ascertaining if it is continuous to the level below. At present the exact nature and extent of the strike is not known.

GLOSTER.—Helena *Independent*, Dec. 13: The new 60-stamp pan-mill (twenty-four pans, twelve settlers, and forty-eight tanks) is ready to run and has probably already started up, although at the time our informant left Gloster the weather was too cold to commence operations, as there was so much new machinery that to start it up in very cold weather might result in dangerous breakages. With the almost unlimited quantity of ore at command in the Gloster, and appliances that will save the gold, and also the steadily increasing percentage of silver, we shall expect to hear of a magnificent output of the precious metals from this splendidly equipped plant in the near future.

NOTES. Butte *Miner*, Dec. 12: The drift from the Alice 800 ft level has advanced west 200 ft and east 100 ft on the ledge, and some good ore is being stoped out from both. The Pollack, which is worked under a lease by Patsey, Johnny and Dennis Clark, is turning out a big mine. The tunnel has advanced 250 ft under the hill and is in good ore. Sixteen men are employed in the stopes, which now show 80 ft of back. The ore taken out is high grade, the last two shipments returning 102 and 107 ounces respectively. Clark's Fraction is looking well in the drift, which has been run from the Alice 300 ft. The drift is in 2 to 3 ft of good pay ore. About 5 tons of 100 ounce rock is taken out per day. The Clark's Colusa shaft is down 210 ft, at which point a station has been cut in the large body of ore at the bottom of the shaft and a station set has been put in. Drifting on the ledge will be commenced to-morrow. The Neptune stopes are looking well, and from six to seven tons of 60 and 70 ounce ore are raised daily.

NEW MEXICO

LAS VEZAS PLACERS.—*Gazette*, Dec. 12: In excavating for the foundation of the new Court House, two men found "the color," and staked out claims. There is every probability that these men, whose names are John Gilky and Charles D. Smith, secured some valuable property. A placer digging that will even yield two cents a pan, situated as the above properties are, is the biggest gold strike that has ever been made in this section. With an abundance of gravel from ten to thirty ft to bedrock, water easy of access and cheap lumber, it almost equals the California discoveries of '49. In case the fortunate owners should desire to put in hydraulic works they can do so at a small expense from the city water works. The pressure that can be obtained is one hundred and forty-five pounds to the square inch, which is greater than is generally used. To-day will establish, beyond a doubt, the true value of the new find, and if it is half as rich as represented it means a veritable boom for the city of Las Vegas. Placer gold in paying quantities would increase our population to twenty-five thousand within two months. Our merchants would sell every dollar of their stocks of goods before they could receive fresh supplies from the east. The city would be flooded with strangers, the hotels crowded, livery men would make fortunes and real estate men grin.

SIERRA GRANDE.—Las Cruces *Republican*, Dec. 15: The ore taken from the Sierra Grande comprises galena, lead carbonates, native and horn silver, and now and then black sulphurets of silver. Excavations have been made, shaft sunk and tunnels run along the southwestern slope of the hill for a distance of about 800 ft from east to west, and from 250 to 300 ft from north to south, showing everywhere a mass of good milling ore, much of which is high grade—by which is meant ore running from $100 to $800 and more to the ton. One piece of ore taken from the mine was shown which runs $20,580 to the ton. This ore-body has been penetrated by shafts sunk from 10 to 22 ft deep, without determining its thickness, as the bottom of the ore-bed has nowhere been found.

FLEMING.—Southwest *Sentinel*, Dec. 12: The Fleming mill started up again the latter part of last week, after being closed down for several days to allow a "clean up" to be made. It will run steadily from now on. There are at least 350 tons of ore on hand at the mill and several hundred more on the dump at the mine. The mine is looking better than it ever has. The "clean up" made at the mill last week far exceeded the expectations of the proprietors. The amount of bullion obtained was seven bars, aggregating nearly $12,000. This is the second "clean up" of the mill since it began running, about six weeks ago.

MODOC.—The Modoc mine, in Bald Mountain district, is showing up well. On the surface the vein was but four inches wide and not very rich, but at a depth of 14 ft the vein has widened to 24 inches and the ore is very high grade. We were shown some specimens from there yesterday that were literally filled with horn silver.

GOLDEN RULE.—A strike of great importance was made at the Golden Rule mine, Dragoon summit, on Monday. At the deepest point in the mine, in the drift running west, a seven ft ledge of the usual grade ore was opened up. This proves beyond a preadventure that the mineral body increases as depth is attained in this mine at least. The stockholders are jubilant.

UTAH.

NOTES.—Park *Mining Record*, Dec. 15: The Shenandoah mine, in Snake Creek district, will next week commence ore shipments which, should the weather prove favorable, will be kept up all winter. The Silver Key is working a force of 8 men, and the mine is looking well. Ore shipments will not be resumed for some time, owing to the large amount of dead work which has to be done. N. C. Springer has taken charge of the Keystone, and has put to work a force of 12 men in running tunnels. The vein in the Creole has been cut and sinking on it commenced. The Creole is the nearest ore-producing property in the camp, and can handle its ores at a very slight expense. The weather in this section continues clear and cold, and the ground is almost entirely free from snow, making the best winter for several years past for prospecting. We have had presented us by F. W. Hayt, manager, the prospectus of the Southern Tier Mining Co., whose mines are located in Snake Creek district, Wasatch county. It shows the prospects very flattering. The capital is $2,000,000—100,000 shares of a par value of $20 each.

For Mining Shareholders' Directory, Stock Reports, etc., see page 420.

Collecting Flue Dust—No. 6.

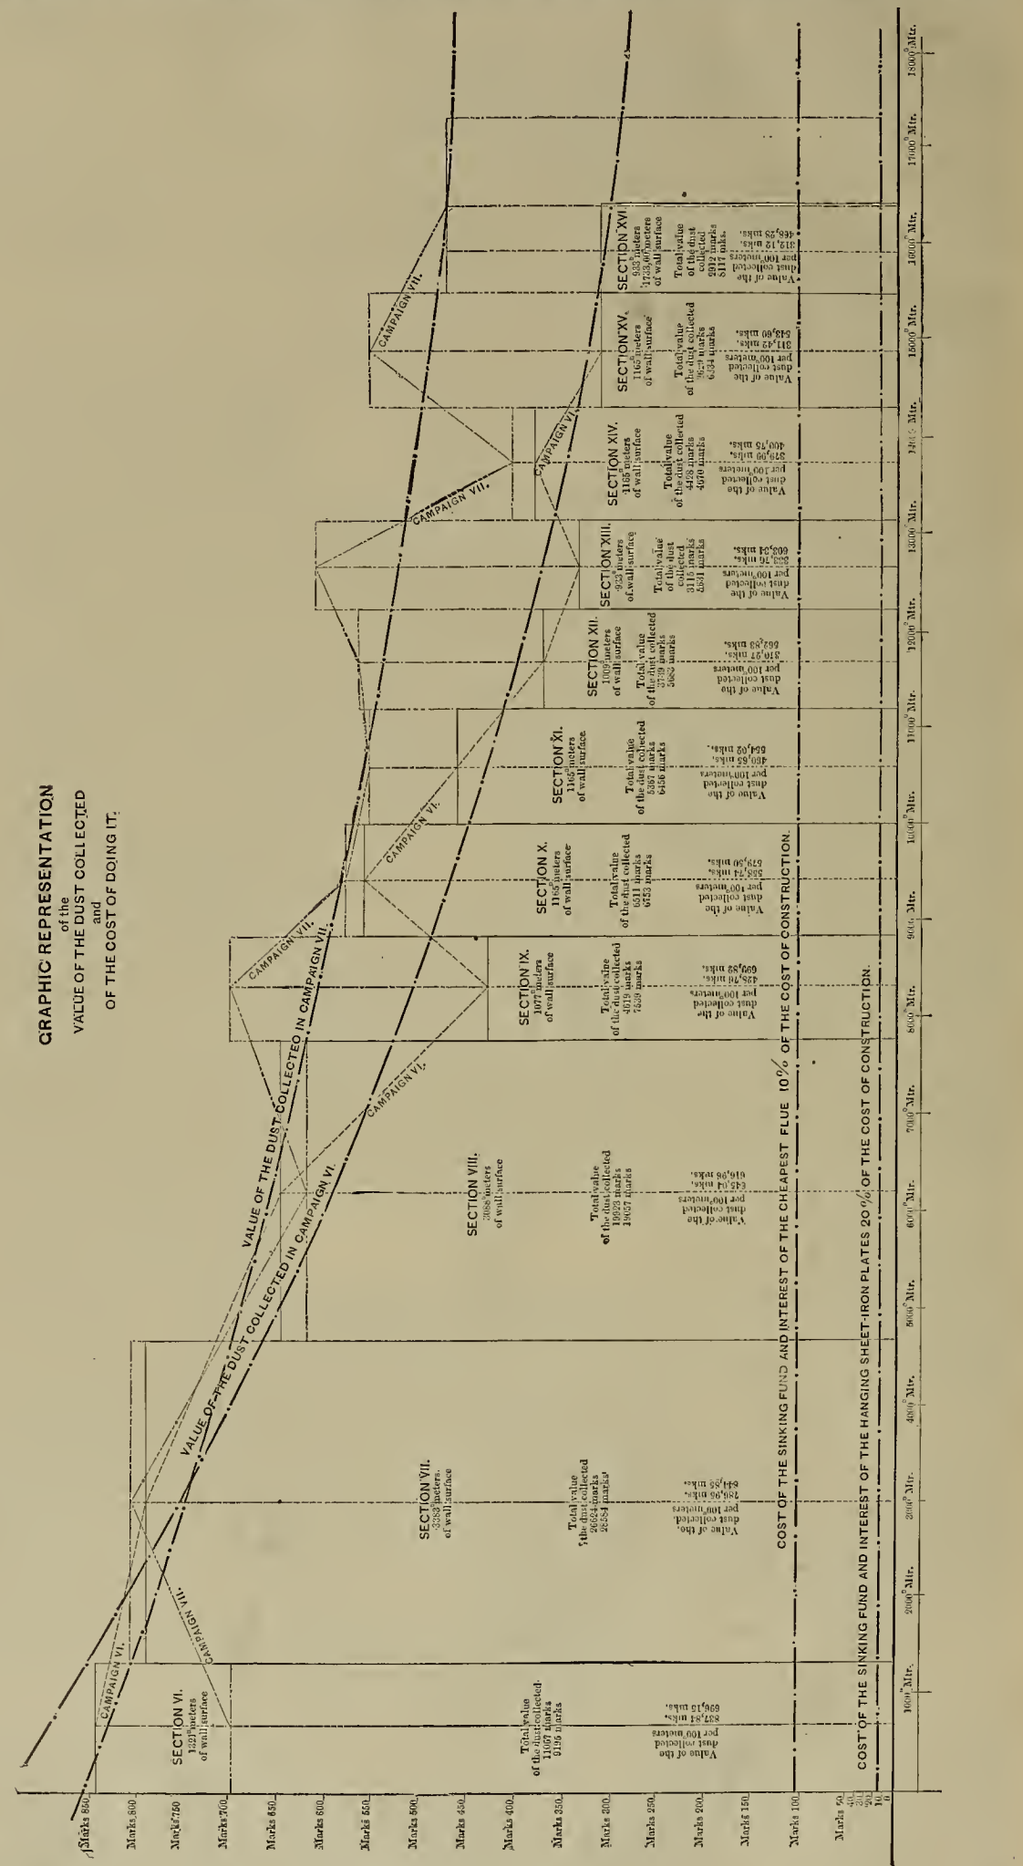
The sixth campaign lasted 314 days. During this time the ore treated contained 6,247,605 kilos. of lead. The seventh campaign lasted only 200 days, and the ore treated contained 4,245,303.21 kilos. of lead.

There was a very large increase in the quantity of dust collected, except in Sections V, VI, VIII, X, and XIV, where the quantities are in round numbers 26,000, 13,000, 3,000, 2,500 kilos. less. The total quantity collected is, however, greater than in the sixth campaign, and almost in direct proportion to the increase of wall surface. But in every case where there is a diminution, except in Section XIV, there is an increase in the quantity of lead per 1,000 kilograms. The quantity of lead per square meter of wall surface is less in Sections V, VI, and VIII, and slightly more in Sections X and XIV. The total quantity is, however, enough more to justify close attention.

It would naturally have been thought best, as soon as the practicability of this method of using iron plates had been proved, to have hung the whole flue full of them; but as no sufficient data had been collected as to how far the draft would be affected by it, it was done very gradually. Before the seventh campaign, in August, 1881, 1,140 square meters were put in. In March, 1882, before the eighth campaign, 10,450.86; and after the eighth campaign, in September, 1882, 13,055.35 more; so that up to this time there were 24,471.60 square meters of sheet-iron plates hung in the flue. An accident, which happened in the summer of 1882, made it necessary to do away with the upper part of the condensing-chamber building, which includes Sections X, XI, XIV, and XV, Figs. 14 and 15, as the roof was no longer tight. The flue itself had then 18,060.01 square meters of wall surface; this, with the 24,471.60 square meters of sheets, made 42,531.61 square meters of available condensing surface. The sheet-iron plates introduced cost 18,108.98 marks. If this amount of surface had been introduced by means of a masonry canal, such as is shown in Fig. 9, the square meter of which costs at least 11.71 marks, it would have amounted to 286,562.44 marks. There was thus saved by the use of the iron plates a sum of 268,483.46 marks.

It was a matter of some interest to ascertain whether the draft had not been diminished by the

Enormous Friction Surface



Which has been added in the flue by the very large amount of surface introduced into it. As the entire flue during the three weeks that the works were obliged to stop for these repairs, was very much cooled, it was found that at the time the works were put into blast again, there was such a very weak draft that it was necessary to put a fire at the bottom of the chimney on the top of the hill. After three days' use of it the draft was sufficiently strong to make it no longer necessary. The damper in the chimney is now not entirely open. Little by little it will be brought back to its former angle. With regard to the temperature in the flues, the gases escaping from the chimney in the normal working of the establishment have a temperature of between 60° and 70°. With regard to the quantity of lead contained in the dust, setting it on fire undoubtedly diminishes the quantity more or less; but that upon the arch, which afterward falls to the ground, does not contain as much as that which collects on the bottom of itself. Taking the sample for the assay is on this account very difficult, and mistakes are very apt to be made, when the fact of the dust collecting in layers of variable richness is not taken into account. The assays taken at the end of the seventh campaign were in any case more nearly correct than those taken at the end of the sixth.

The Sheet-iron Plates

Which have been hung have lasted extremely well. Not one of them has as yet been damaged, and it seems more than likely that they will last at least five years. The only danger appears to be from dampness, which would cause them to rust, and this can only be avoided by confining the places in the flue where they are hung to such a distance from the furnaces that it is certain that all the dampness will have previously been condensed out of the gases, and by properly draining the surface so that no moisture can collect in it from the outside. By this system it is possible to collect the whole of the dust in a small part of the flue near the works, and thus save a large amount of transportation of the material collected, while at the same time diminishing by so much the loss consequent on carrying it. This loss by transportation will, of course, be reduced to a minimum when the dust is agglomerated.

Cleaning the flue necessitates, at certain intervals, a stoppage of the works, so that only those places are frequently cleaned in which the sheet-iron hangs, while the flue itself is cleaned at longer intervals. In those places where a stoppage of the works is impossible, two flues filled with sheet-iron plates can be built side by side in the most convenient situation, so that either one may be connected or cut off entirely from the main flue, according as they have been cleaned or are to be cleaned, without stopping or even hindering the work of the furnace at all.

During the seventh campaign no change in the quantity of wall surface was made except in Section 16, where the wall surface was increased from 933 square meters to 1,733 square meters. It is very remarkable that while between these two campaigns no change in the quantity of wall surface has been made except in Section XVI, all the weights and values have been altered by this single change; and that while the flue has been made very much shorter by the cutting out of the condensation chambers X and Y, the wall surface has been so much increased by the addition of sheet iron plates that, with the exception of Sections VI and VIII the value has in every section been increased, while the total value has been very largely increased, which is shown by the curve representing Section XVI in the seventh campaign, being very much higher than that of Section XVI in the sixth campaign, making the total value of the dust collected in this section more than three times what it was in the former campaign, while the surface has not been quite doubled. This shows beyond doubt that the quantity of material collected is proportional to the extent of wall surface, and that the cubical contents of the flue itself is of importance only as it allows of a maximum amount of surface in the shape of plates being introduced within it. It is also to be remarked that while the curve in the seventh campaign is much flatter it commenced in Section VI with less value, and there seems, therefore, no doubt whatever that this method which is not only

cheap, so far as the installation is concerned, is also by far the most effective of any which has yet been devised for the collection of flue-dust, and notably for the condensation of the volatilized material. It is to be noticed that there are three separate causes which will make the curve flatter. The first of these is the decrease in value, owing to the complete separation of the particles mechanically carried off; the second is the decrease in value, owing to the reduction in temperature; and third, the decrease in the value of the gases, owing to the separation of the metallic particles held in suspension.

As is Shown by the Results.

The first cause, that is the separation of the particles carried off mechanically, acts within a very short distance from the furnace, so that by the proper construction of the condensing plates, nearly the whole of the ore particles will be separated from the gases, not far from the furnaces themselves. There will remain then in the gases only the volatilized metals. Some of the causes of the difficulty of the separation of them from the gases have been already discussed. It appears, however, that the curve might easily become a straight line if it were possible by the introduction of an infinite quantity of surface to condense the whole of the dust. It would seem from the discussion of these two curves that the influence of the reduction of temperature was not as great as it appeared to have been from the experiments made in the sixth campaign. It will, however, probably be found expedient on account of repairs to still further disengage the sides of the flue, both for convenience of repairs and convenience of access.

The Square Meter of Wall Surface,

Made of new sheet iron, No. 22, including the cost of erection, will not cost more than 0.75 marks. One hundred square meters would, therefore, cost 75 marks. In making up the cost of these two methods of getting surface as is shown upon Plate III, 10 per cent of the cost of construction has been charged for the sinking fund of the masonry walls, while for the sheet-iron surface, 20 per cent, which is a very large charge, is made. The yearly charge, then for the sinking fund for the 100 square meters of masonry surface, would be 102 marks, while for the surface obtained by hanging in the sheet-iron plates it would only be 15 marks. The difference between the two is shown very decidedly in the lines representing the cost, Plate III. From the experiments which have already been made since the introduction of these sheet-iron plates in the flues, 20 per cent seems to be a very exorbitant charge, although made very high purposely, in order to make the most disadvantageous comparison between the two systems. No perceptible alteration or wear has been shown after a use of five years, so that if less than 20 per cent is charged, the line would go still lower than it now does, and it would seem to be the natural conclusion that the cheapest method would be to build short, large flues in which the maximum of wall surface was obtained by the intercalation of these plates. All the experiments made up to the present time fully justify the conclusion, that not only is this the most economical method of saving a quantity of material which has hitherto gone to profit and loss, because it was supposed to be impossible to save it, but that it is also possible to reduce very largely the cost of the works by increasing the wall surface indefinitely at a very cheap rate. The most remarkable fact relating to these experiments is this, that by almost doubling the wall surface in the last section of the flue which is furthest removed from the works, where there was no probability that any material mechanically carried off by the gas would be still retained suspended in it, there is such a large amount of value obtained from the dust. This can only be attributed to the fact that metallic material which is volatilized, and which is collected with such great difficulty, has been carried to that point and condensed there, and that without this increase of wall surface this large amount would have gone up the chimney and been entirely lost. It seems, therefore, that not only in all works where the flue dust contains value should especial attention be given to collecting it, but that the quantity of metal which is actually volatilized, merits special attention.

When the values which represent the different sinking funds for the year are transferred to Plate III, and compared with the curve which shows the value of the dust collected in the different divisions of the flue, and these data are also compared with the very great value of the flue dust collected, it is a matter of surprise that the collection of flue dust in metallurgical works does not appear to have attracted more special interest than it has done, if only on account of pecuniary importance.

THE California Wire Works of this city report their business as follows: Capital invested, $500,000; paid for labor in past year, $120,000; average number of hands employed over 16 years of age, 100; under 15 years of age, 15; average day's wages for skilled labor, $3; for ordinary labor, $2. In the establishment no Chinese are employed.

ARTHUR MACY, a graduate of Columbia School of Mines, New York, has been appointed Superintendent of the Silver King Mine, of Arizona.

USEFUL INFORMATION.

The Tanning of Tissues.

According to the *Moniteur des Fils et Tissus*, a Belgian inventor, M. Piron, has devised a process which renders tissues waterproof and capable of resisting decomposition without impairing their softness and appearance, or greatly increasing their weight. The inventor first collected specimens of tissues which had been subjected to various processes of a preservative character, and afterward exposed to the effects which he proposes to render uninjurious. The head-bands found on Egyptian mummies having been impregnated with resinous substances, M. Piron concluded that the vegetable kingdom was the most likely division of nature in which to seek the needful substance, and he claims to have discovered it in a product obtained from the bark of the birch tree, which is known to be used in the manufacture of Russia leather. The distillation of the fine white bark produces a light oil, about one-quarter of which is formed by that peculiar kind which communicates to Russia leather its particular odor. The green birch tar is obtained from the Kostroma district, and forms, in conjunction with alcohol, a solution of great fluidity, but when dried and resinified it resists the action of alcohol and unites itself to the most brilliant colors. These properties allow of its not only filling the capillary vessels of tissues, but also coating them with a substance of great elasticity, not affected by acids or the action of sea water, and capable of supporting changes of temperature. Its density is said to be small, and it consequently increases but slightly the weight of the tissues, which it renders impermeable. Materials thus treated can be folded without the surface splitting in any way. This substance, while being economical, fulfills all the conditions of such a preparation. Its aromatic odor serves to keep away insects. No microscopic vegetation can take place, as neither water nor air can penetrate into the interior of the fibers.

It is stated that M. Piron's invention can be applied to all tissues, etc., made from vegetable substances, such as sail-cloth, ropes and cordages, wagon coverings, and other articles.

Imitating Expensive Leather.

Transforming cheap leathers to imitate the more expensive grades by giving them the outward appearance of superior quality, has become an industry of some importance. This is accomplished by a process that is simple, economical and effective, consisting of two principal operations.

The leather which it is desired to imitate is thoroughly cleaned and carefully coated with graphite, the work being similar to that necessary in preparing a smaller article for electroplating. It is then placed in a copper bath, the tank of which is large enough to easily receive a skin of any size. A dynamo-electric machine, generating a powerful current, furnishes the electricity. The copper is deposited upon the coated surface of the hide to a thickness of from one-sixteenth to one-eighth of an inch. The plate thus formed reproduces, but reversed, every mark and minute vein of the leather, so that a print taken from it is an exact copy of the original in every detail.

A hide of cheap leather is laid upon the bed of a machine much resembling the ordinary iron planer. Extending across the bed is a large iron roll journaled at either end in boxes which slide between two vertical standards. Strong screw bolts regulate the distance between the bed and the bottom of the roll. The copper plate is laid upon the leather, and two or three thicknesses of felt cloth placed on the copper. By the aid of long levers the bolts are screwed down until the iron roll bears upon the copper and leather with a pressure of many tons. The bed being moved forward until all the plate has passed under the roll, the hide is removed and is found to have been raised, in looks, to grain leather of the finest grade, or to alligator, as the case may be. The copper plate, being extremely hard, will print many hides. In some instances the plates are engraved, but as this method is more expensive, and the reproduction not so faultless, it is but seldom resorted to.—*Scientific American.*

INFLUENCE OF QUALITY OF SEED UPON THE CROP.—One of the most important conditions of a successful vegetation experiment is uniformity in the seed used. With this in mind, Hellriegel has investigated the effect of variations in the absolute weight, and in the specific gravity of seeds upon the growth of the resulting plants. He finds that, of seeds (of barley) having the same specific gravity, the heavier seeds produced at first more vigorous plants than the lighter. As the plants continue to grow in good soil, the differences gradually diminished, until, at the time of harvest, they had entirely disappeared. When the plants grew in poor soil, the effect of differences in the seed was more lasting, and even affected the total weight of the crop. Differences of specific gravity in seeds of the same weight produced no recognizable effect upon the crop. The stage of ripeness of the seeds affected the development of the plants in the same direction as it did the absolute weight of the seeds; the riper seeds being heavier, and producing the most vigorous plants, and the differences being most manifest on a poor soil. Essentially the same results were obtained in experiments with potatoes. The attempt was also made to raise potatoes of greater or of less specific gravity, by selection; the heaviest or lightest being continually selected for seed. The experiment was continued through three seasons, with a negative result.

PURIFICATION OF SEWAGE.—Experimental trials of the Andrews-Parker process for deodorizing and purifying the sewage of London have been in operation since last May. The 90,000,000 of gallons daily and nightly flows into subterranean reservoirs located beyond Beckton. By the action of water and repeated pumping before the last station is reached all the fecal matter in the sewage is reduced to a liquid having a grayish-black appearance and an extremely offensive odor. The sewage, after having been drawn into a tank, is subjected to a powerful stream of water, under heavy pressure, charged with ground clay, caustic soda, hydrochloric acid and sulphate of iron. The mixture is then turned into large tanks, where it is allowed to remain until the action of the precipitates has thrown all the sediment to the bottom, when the liquid is drawn off into the Thames, it being a pure, colorless and odorless water. The sediment is kiln dried and pulverized, and makes a fertilizer which chemical analysis has shown to contain a large proportion of ammonia and phosphates, and to be of much commercial value.

THINGS TO TREASURE.—Accumulations of knowledge and experience of the most valuable kind are the result of little bits of knowledge and experience carefully treasured up. Those who learn nothing or accumulate nothing in life are set down as failures, because they have neglected little things. They may themselves consider that the world has gone against them; but, in fact, they have been their own enemies. There has long been a popular belief in good luck, but, like many other notions, it is gradually giving way. The conviction is extending that diligence is the mother of good luck; in other words, that a man's success in life will be proportionate to his efforts, to his industry, to his attention to small things. Your negligent, shiftless, loose fellow never meets with luck, because the results of industry are denied to those who will not make the proper effort to secure them.

WHERE THE GOLD GOES.—A writer of mathematical bent finds from the census returns that there are about 17,000 dentists in the United States, who, he estimates, pack into the teeth of the American people a ton of pure gold annually. Continuing his speculations, he predicts that in the twenty-first century all the gold in the country will be buried in the graveyards.

GOOD HEALTH.

Slow Digestion and Acid Dyspepsia.

This, the simple and most common form of the malady, is sometimes called simple dyspepsia. It is more common in men than in women, and especially affects sedentary persons, and those nervous individuals who eat rapidly, swallowing their food without proper mastication. It is also common in persons whose teeth are defective. Its immediate cause is deficient activity of the muscular walls of the stomach and intestines, and also deficient quantity or quality of gastric juice. The symptoms are much the same as those which follow the taking of an excess of food, but are felt when only a moderate amount has been taken. An hour or two after eating a sensation of weight and oppression is felt. The discomfort continues for some hours, gradually wearing off before the next meal. The appetite is usually pretty good, but often will not be prepared for the reception of food at meal time, as the work of digesting the previous meal has not yet been accomplished. Sometimes there is considerable flatulence of the stomach, the eructations being tasteless, however, never offensive; often pain between the shoulders or beneath one shoulder-blade, and not infrequently in the region of the heart. Palpitation of the heart often occurs in the night, causing great alarm on the part of the patient and his friends, who entertain fears of sudden death. Sleep is disturbed and unrefreshing. The tongue is often foul in the morning, with a bad taste in the mouth. All the symptoms mentioned are greatly exaggerated by a late supper, or by an unusual excess in quantity or quality of food. The bowels are usually constipated, but may be regular. When the difficulty has been long continued, there will be observed a marked disposition to sleep after meals, or unnatural sleepiness at other times, and a decided loss of natural vivacity and energy.

Acid dyspepsia is that form of indigestion in which the slowness of digestion is such that the food undergoes fermentation, forming acids which irritate the stomach and give rise to the same symptoms, much exaggerated, which have been mentioned as attending slowness of digestion with several others, the principal of which are heart-burn, regurgitation of intensely sour liquid from the stomach, acid eructations, a white tongue, frequently with transverse fissures, often flabby and indented at the edges, acid saliva, causing decay of the teeth, bowels likely to be either constipated or unnaturally loose, grinding of the teeth at night, and a reddish sediment in the urine. No one patient presents all these symptoms, but more or less of them. There is quite likely also to be pain at the pit of the stomach, with soreness on pressure.

On account of the extreme slowness of digestion, farinaceous foods always aggravate this form of dyspepsia. Starchy food, sugar, fruits, and especially vegetables of all kinds, cause great increase of acidity and heart-burn. In some cases, even bread and all sorts of preparations from grains will disagree. Sugar, or any food containing it, will give rise to great distress. A meal consisting of animal food almost entirely, may be digested without difficulty, though milk frequently sours.

The digestion being very slow, portions of fermenting food remain in the stomach from one meal to another, so that acidity becomes habitual.

Patients suffering with this form of dyspepsia are usually very thin, and bloodless. Occasionally, however, we meet a case of the opposite kind, in which there is an abundance of tissue, though of a loose, flabby texture. Women suffer from acidity more than men.—*Herald of Health.*

The Nails.

The nails are structures which are very nearly like the epidermis and the hair, composed of a hard, horny matter arranged in the form of cells. They are, indeed, only altered portions of the external or epidermal layer of the skin, and rest upon their nail beds in much the same manner as the epidermis or scarf-skin lies on the true skin or derma. We speak of the root and the body of the nail—the root being that portion towards the hand which is situated beneath the skin, the body all the rest of the nail. The matrix is the bed upon which the nail rests and to which it is firmly adherent. Nails grow from the root, just as do the hairs, and only slide over their matrix or bed, so that an injury to the matrix, such as slivers beneath the nail, or run-arounds, or even a bad bruise, need not cause a disfigured nail other than of the portion directly injured; whereas, injury or disease of its root will generally cause a distorted and disfigured nail. I have seen a bruise at the root, and in one instance the sting of a bee over the root of the nail, followed by an irregularly formed nail, which lasted for a long time. Thus, also, eczema attacking the hand, may affect the ends of the fingers, or even the sides at the ends, and the nails remain perfect; but when it is located on the backs of the fingers, and involves the roots of the nails, the latter rarely if ever escape distortion and malgrowth.

Nails seldom fail to give indication of sickness which has been at all severe, by an arrest of development which has taken place in the root at the period of sickness. Some studies have been made in this direction which may not prove uninteresting or without value in the present condition, which we will quote from Mr. Wilson. A French physician, Dr. Beau, has observed that the nail of the feet are four times slower in their growth than those of the hands. The latter increase in length one-thirtieth of an inch in one week, while the nails of the toes require four weeks for the same amount of increase. According to him, the length of the thumb-nail including the root which is hidden from sight, is eight lines—that is, twenty millimeters; consequently, the period occupied in the growth of that nail would be twenty weeks, or five months. In like manner, the nail of the great toe, measuring in length nine lines and a half, or twenty-four millimeters, and requiring four times the period of the thumb-nail, would consume ninety-six weeks, or nearly two years in its growth.—*Manufacturer and Builder.*

TO MAKE court plaster, take French isinglass, 1 ounce; warm water, 1 pint; glycerine 1 ounce; tincture of arnica, half an ounce. Soak isinglass in a little warm water for twenty four hours, then evaporate nearly all the water by gentle heat. Dissolve the residue in a little proof spirits of wine, and strain the whole through a piece of open linen. The strained mass should be a stiff jelly when cool. Stitch a piece of silk or sasanet on a wooden frame with tacks or thread. Melt the jelly and apply it to the silk thinly and evenly with a badger hair brush. A second coating must be applied when the first has dried. When both are dry apply over the whole surface two or three coatings of balsam of Peru. This plaster remains quite pliable and never breaks.

A PEOPLE WITHOUT CONSUMPTION.—A paper was read recently before the Tennessee Medical Society with the title, "A People Without Consumption, and Some Account of their Country." The country in question is the Cumberland plateau. The writer, Dr. Wright, has practiced in the region throughout a generation, and in his assertion of fact touching the entire absence of consumption, he is supported by the testimony of about twenty other physicians of standing.—*Medical and Surgical Reporter.*

TABLE OF CONTENTS.

EDITORIALS.—The Worthington Mine Pump; A Mining Review, 409. Passing Events; Assaying Purchased Ores; Geology of the Comstock Lode; Assay Office; Mining in Mexico; Close of the Volume, 416. Graphite; The New Copper Assay; Minerals on School Lands, 417.

ILLUSTRATIONS.—The Worthington Steam Pump for Mining Purposes, 409. Diagram of Collecting Flue Dust, 414.

CORRESPONDENCE.—Notes in Nevada, 410.

MECHANICAL PROGRESS.—A New Heat Motor; Injury by Heat; The Transmission of Power; Cost of Locomotive Power; Covering Iron and Steel with Copper; About Belting; Steel Chains; Illumination of Steam Boilers; Steel Cars, 411.

SCIENTIFIC PROGRESS.—Philosophy of Oil Calming Waters in a Storm; Aluminium Metal; A New Insulating Material; What Bacteria are; New Test for Oxygen Eliminated by Plants and Animals; Sulphur Phosphorescent; The Magnetic Pole; Cutting off the Head not Killing; Transfer of Energy by Electricity; Luminous Paint; A New Incandescent Lamp; The Chemist's Aid Invoked, 411.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 412-13

USEFUL INFORMATION.—The Tanning of Tissues; Imitating Expensive Leather; Influence of Quality of Seed upon the Crop; Purification of Sewage; Things of Treasure; Where the Gold Goes, 415.

GOOD HEALTH.—Slow Digestion and Acid Dyspepsia; The Nails; To Make Court Plaster; A People Without Consumption, 415.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 420.

NEWS IN BRIEF.—On page 420 and other pages.

MISCELLANEOUS.—Assay of Salt; Amount of Salt Used with Ore; Wages in San Francisco; The Mine, 410. Collecting Flue Dust—No. 6, 414.

Passing Events.

The advent of the holiday season has brought with it more or less freedom from business cares to the average worker, and pleasant hours to the majority of mankind. To us in California the most welcome thing has been the bounteous rain which has generously spread all over the State to the infinite rejoicing of farmer, miner all California agrees on, the value of copious and merchant. This is one thing at least that rains to the whole country, and this week they have been generous and widespread.

The mining regions just now are more or less snow bound, except near the coast and to the southward. The mining industry generally, therefore, has little to say for itself. Still work is going on rapidly wherever it is practicable to push it.

This number closes volumne XLVII of the MINING AND SCIENTIFIC PRESS, and, as we state elsewhere in these columns, "Now is a good time to subscribe."

Before another number of the PRESS appears, the new year will have commenced. It is proper now, therefore, for us to wish our patrons a happy and prosperous New Year, and to hope they will stay with us to the end.

THE Sierra county papers say mining is being actively prosecuted in that region, and in many cases with much success. As a single sample, the Bald Mountain Extension Company cleaned up 119½ ounces of gold last week from 741 carloads of gravel. The gold is coarse, one piece weighing five ounces.

SWEETWATER, says the Bodie *Free Press*, is becoming one of the most actively prospected camps on the coast. New discoveries are frequently made, and large quantities of good ore lie on the dumps throughout the district, awaiting the erection of a custom mill.

Assaying Purchased Ores.

There has always been more or less discussion on the relative merits of crucible or scorification assays, some contending for one and others for the other. On this coast the crucible assay has been more generally favored; while in Colorado, Utah and thereabout they have inclined to the scorification assay. In such camps as have competing custom reduction works it is necessary that some standard should be set, so people engaged in the purchase and beneficiation of ore should have some regular basis to work on. In Leadville, where there are many smelting works, they have concluded that the methods of assaying and settling for ores so long in vogue are unsatisfactory, and eight of the principal smelting works have agreed to enforce certain rules, which will be of interest to all miners, as showing the practice in the largest district in the country. These rules are worthy of preservation by miners having ores to sell, as it will show what the custom is elsewhere, in a place where they have had great experience.

First. Assays shall be made by standard scorification.

Second. Moisture shall be determined by the assayers of the smelters, and no splits shall he recognized.

Third. In silver assays contents shall be noted only in full and one half ounces; that is, every fraction under one half ounce sball he left off, and every fraction over one half ounce shall also he omitted.

Fourth. Gold ores sball be noted in pennyweights only, no payments to be made for less than one-tenth of an ounce contents per ton.

Fifth. In lead assays, fractions of units shall not he noted, and no payment shall he made for less than five per cent contents per ton.

Sixth. The splitting of assays shall be discountenanced, and settlement made on smelters' assays, of within one ounce of silver, one-twentieth ounce of gold, and one per cent of lead of control assays. If a difference of more than one ounce silver, one-twentieth ounce of gold or one per cent of lead exists, the umpire sample shall be assayed.

Seventh. No person shall be allowed to serve as umpire unless in the employ of the smelting works, subscribing to these rules, or in the employ of the mine.

Eighth. In case it is necessary to employ an umpire assayer, the mine owner or manager shall have the privilege of selecting an assayer from among the smelter assayers. Should the mine owner or manager prefer to have his ore assayed by a mine assayer, then the smelter shall have the privilege of making the selection.

Mining in Mexico.

Mere speculating mining may he said to he "dead" in Mexico, that branch of the business having been greatly overdone. As a field for productive operations, Sonora is not surpassed if equaled by any other section of country in the world. A gentleman who has been over a great deal of it and had an opportunity for close personal observation, assures us of the fact. But with all its mineral wealth, the advent of railroads and the many strangers who have, during the past few years visited this State, not much has been done towards developing its mines or increasing its product of bullion. The most of these visitors have been nomadic adventurers—mere mining tramps; men who have talked a great deal with their mouths but who, for any useful purpose, have shown themselves worse than nonentities. Coming here with plausible stories of their ability to sell mines in New York, London, and the other great marts of the world, owners have been beguiled into handing their mines to them, often for long periods, only to find themselves fooled at last, the properties failing to be sold, or if sold, some latent devilment being revealed before the transaction was ended. So general now is this distrust of strangers that parties here decline longer to hand their mines except to men known to be responsible and able to handle them. For those who wish to buy mines outright this is the country for bargains. So, also, will persons desirous of securing controlling interests in mines in lieu of their opening, equipping and working them, be able here to negotiate favorable terms to that end. Where parties have the confidence of owners, arrangements of this kind can readily be effected, many Mexicans preferring in such case to retain an interest in their mines to selling the whole, even for cash.

Geology of the Comstock Lode.

A very important work has just been issued by the government entitled, "Geology of the Comstock Lode and the Washoe District," by George F. Becker. The work is a quarto of 422 pages, 7 plates and atlas of 21 sheets folio. The atlas contains a fully indexed claim map of the district; a geological map of the surface; 10 geological sections of the lode; a vertical projection of the ore bodies and maps of mine workings complete to January, 1881. The most noteworthy plates illustrate rock sections under the microscope; and these are the finest ever made, being a study to any one interested in the subject. The geology of the Comstock was examined by Mr. Becker in 1880–1, and after a long delay in the government printing office the work is now issued. The Director of the U. S. Geological Survey is forbidden by law to distribute the special reports prepared under his charge except at the price of publication, or in exchange for scientific books needed by the survey. This work costs $11., and can be procured for that sum only from the Director of the U. S. Geological Survey, Washington. The following brief statement of the principal results reached will serve to indicate the nature of the report, and to many will convey as much information as is desired:

The economical importance of the Comstock lode appears from the fact that in the twenty-one years ending June 30, 1880, a little over $306,000,000 worth of bullion has been extracted from it. Of this about $132,000,000 worth was gold. The mines are the deepest in America, reaching a distance of over 3,000 feet from the surface, and they contain about 185 miles of galleries.

Besides the scientific importance attaching to the occurrence of the immense accumulation of ore, the lode and district present other features of great interest. The nature of the rocks associated with the ores, some points of structure, and even the character of the deposit, have received different explanations at the hands of different observers. A digest of the memoirs of Messrs. von Richthofen, King, Zirkel and Church forms one chapter of the volume.

The subject of rock decomposition has received special attention in the examination described in this report. This study has led to some lithological and mineralogical observations of interest, and to the identification of all the Washoe rocks with well-established rock species. The greater part of the hanging wall of the lode is diabase; the "black dike" is also a variety of diahase, and the supposed trachyte of the district is a hornblende-andesite. The so-called propylite of Washoe comprises a number of tertiary and pre-tertiary rocks reduced to a nearly uniform appearance by decomposition. The erroneous determination of these altered rocks as an independent species arose mainly from a confusion between green and fibrous hornblende and chloride. The supposed propylites from the other districts in the United States, microscopical determinations of which have been published, were also examined and found to afford no sufficient evidence of an independent rock species.

A discussion of faulting leads to an explanation of the similarity of the shape of the west wall of the lode and the form of the adjoining face of the Virginia range. The ravines of the latter are a direct result of faulting, and are only slightly modified by erosion. A cross-section of the country on the Sutro tunnel line shows that the surface forms a logarithmic curve in accordance with the theory, which is further supported by experiments. The sheeted structure of the country seems to be referable to faulting and not to eruptive bedding. The theory leads to rules applicable in prospecting disturbed but not greatly eroded districts. The details of the topography of grassy hills are chiefly due to landslips, which come under the law of faults in a modified form, and the characteristic curves of smooth hillslopes are logarithmic.

The order of succession of rocks in the Washoe district is: Granite, metamorphics, granular diorite, porphyritic diorite, metamorphic diorite, quartz-porphyry, earlier diahase, later diahase, earlier hornblende-andesite, augite-andesite, later hornblende-andesite and basalt. Hornblende-andesite thus followed as well as preceded augite-andesite.

Chemical evidence is offered to show that the pyrite of the region is a result of the action of soluble sulphides on the ferro-magnesian silicates of the rocks. Chlorite is held to be a product of the decomposition of hornblende, augite, or mica, while epidote forms at the expense of chlorite under certain conditions, but never from feldspar. There is extremely little kaolinization at Washoe, the feldspars having yielded to another kind of decomposition. The diahase of the hanging wall when fresh was argentiferous and auriferous, and the precious metals of the lode are traced to this rock with much probability, the lateral secretion theory being thus affirmed. It is further supported by the dependence of the other ore bodies of the district on the character of the inclosing rock.

The hypothesis that the heat of the lode is due to the kaolinization of feldspar is not confirmed either by theory or experiment. On the other hand, there is much geological evidence pointing to a deep-seated source of heat, probably of volcanic origin. This conclusion is confirmed by extensive temperature observations, from which it appears that from the surface downwards the increase of heat is uniform, about 1° F. for every 33 feet, while in a horizontal direction the heat decreases in a geometrical ratio to the distance from the lode.

Experiments on the kaolinization of feldspathic rock, conducted at the boiling point of water and extending over a number of weeks, show that no heating effect due to this cause could be detected with an apparatus delicate enough to register a change of temperature of 0° 001 C.

The numerous geological sections are discussed in chapter VIII., and the application of the explanations suggested in the preceeding chapters is there shown in detail. All the important and profitable ore bodies of the Comstock, it appears, have occurred at or close to the west face of the earlier diabase, and is near that surface, and there only that exploration is at all likely to be successful. The mode of occurrence of bonanzas is considered, and hopeful prognostications are made for at least two portions of the lode; but a series of bonanzas nearly on the same level, such as was found on the east vein near the surface, is not likely to recur.

Electrical surveys were made both on the Comstock and at Eureka. At Virginia only negative results were obtained. At Eureka a distinct though small difference of potential occurs near ore bodies, and with sufficiently delicate apparatus the method might there be used for prospecting. It is believed that sulphuret ores would have given results of a more convenient magnitude than the carbonate ores of Eureka.

Close of the Volume.

This is the last number of Volume XLVII of the MINING AND SCIENTIFIC PRESS. The very complete index on the last page shows what a wide range of subjects has been treated, and how great a variety of topics have been presented to our readers. The list of patents gives the names of all Pacific coast inventors and their inventions for the past six months, and in most cases reference to the pages cited will reveal an abstract of the patent. This volume has been specially rich in engravings of an instructive and interesting character, as illustrating advance in mechanical, mining and metallurgical appliances.

The PRESS has carefully collated all the current news of the week from the mining districts and camps all over the coast, presenting them in a condensed form to save the reader's time. All new mining or metallurgical improvements which have come forward we have described in as much detail as seemed necessary.

A great deal of original matter has been gathered by our correspondents and presented to our readers. We have also compiled from technical journals all the items of mechanical and scientific progress which have seemed at all practical in their nature, and published all the local news of this character which has been obtainable.

It is the intention of the publishers to continue to improve the PRESS and maintain it in its position as the exponent of the mining and industrial classes of this coast. We have in view several series of articles of great value and interest which will shortly be commenced.

The Assay Office.*

The office should properly consist of three adjoining rooms; one in which the pulverizing, fire work, and other rough and dirty work is done; another in which to weigh and mix the assays, boil the acid in separating the gold from the silver, and keep the fluxes, acids, crucibles, spare muffles, etc.; and a third in which to keep the assay balance, books and papers. The first need not be more than ten feet square. The last may be little more than a well-lighted and dust-tight closet; the middle one should be a moderate-sized room; but it often happens that only one room can be had, and all that can be done is to make the best of it. The muffle furnace should be so placed that when the operator works in the muffle the light comes from behind him. The sun should not shine into the room. There should be a strong bench or table on which to use the pulverizing implement, and it is better if it rest on the ground, and not on the floor, so that the entire office may not be shaken by the blows of the pestle or hammer. A block, similar to that used by a butcher, will answer well instead of a table. Another table on which to place the pulp scales and mix the assays will be required. Above this table, or in any convenient situation

*This extract is from a plain practical work on "Assaying," by Chas. H. Aaron, lately issued and for sale by Dewey & Co., S. F. Price $1.

should be shelves for packages of material, and upon the table, which should be of a good size, a long box divided across into five or six compartments about six inches square and deep, and lowest in front, with a hinged cover to contain the several fluxes, etc., also the test tubes in their rack, the spirit lamp, smaller anvil, etc.

The assay scales should be so placed that the light from a window may strike them obliquely over the left shoulder of the operator while seated at his work. It is still better to have light from two sources obliquely behind the operator, in order that no shadows may be cast on the balance, either by the person or by the case frame. The sun should not be allowed to shine on the balance at any time. The table on which the balance stands should be reserved for that purpose only; there should be another on which to work with pen and paper.

Minerals on School Lands.

In the organic act establishing a territorial government for Utah, is a paragraph to the effect that when the lands in said Territory shall be surveyed under the direction of the government, preparatory to bringing them into market, sections 16 and 36 shall be reserved to be applied to schools in the Territory. This is the usual clause in such cases. The question recently came up as to whether the words of the statute impart a reservation of the grant of the sections as would require further legislation by Congress to open mineral land embraced by these sections to entry under the mining act.

In 1879, the Secretary of the Interior in deciding the question in Dakota as to the right of the U. S. to bring action for trespass on sections 16 and 36 of lands in that Territory, reserved for a similar purpose and in the same way, said: "The lands are public lands, although reserved for a partieular purpose. The United States has not granted the title to such lands, but has reserved them in order that at some future time when a State shall be erected out of such Territory the same may be granted to such State." In Mining Company vs. Consolidated Mining Company, 102 U. S. R. 167, the Supreme Court in a well considered opinion in which all legislation with reference to the manner of disposal of mineral lands and the policy of the government in relation thereto, were reviewed, held that a grant of public lands to the State of California, by the Act of March 3, 1853, for school purposes, "was not intended to cover mineral lands, but such lands were excluded from that grant, as they were from all others, by the settled policy of the government on that subject."

It appears settled then that it never was the intention of Congress to grant to a State or Territory any mineral lands for school purposes. It follows that it cannot be presumed to have been its intention to reserve any portion of them to be applied in the future to such purposes. It is proper to remark further, that since in ease of the lands in question, the United States never parted with its title, it was entirely competent for Congress to exclude the mineral portion (even conceding that a reservation of the same had been made) from such reservation, by the mining act of July 4, 1866, which construction of said act would be in keeping with the decision of Hon. C. Delano, Secretary of the Interior, April 28, 1873, in the Keystone case, the issues in which afterwards came before the Supreme Court in the ease of Mining Co. vs Con. M. Co., cited above and in keeping with the judgment of the court in that ease. Coal lands can, therefore, be taken up under the mining laws, even if in school sections.

ADVICES from Las Vegas, N. M., indicate there is great excitement among the citizens in regard to late gold discoveries. Gold is said to have been found in paying quantities on a lot at the hot springs owned by a prominent resident of Topeka a few days ago by two miners employed to assist in the excavation of ground for a new $100,000 court house. The next morning they were up with the lark staking out mining claims in the courtyard, and now the hills and valleys around Las Vegas are all swarming with excited gold-seekers, many of whom have met with success. A few years ago Elizabethtown, near Las Vegas, had a population of 5,000 gold miners, and for a number of years a company engaged in hydraulic mining, taking out $50,000 annually. There is no doubt as to the presence of gold in paying quantities. The city of Las Vegas is a mining camp, even the ladies being found among the prospectors.

WILLIAM WALKER, a furnacehand at Eureka, Nev., was Wednesday adjudged insane from the results of lead poisoning. This is the fifth man that has gone crazy from working at the lead furnaces at Eureka during the last four years.

THE Bullion of Paradise mine produced, during the time it was run by the Bullion Company, $363,098.02. The company's mill was burned recently, but they think of erecting a new one.

Graphite.

EDITORS PRESS:—Inclosed I send you a small specimen of graphite from a mine I am now developing in the northeastern portion of Fresno county, on what is called the Borer Hill, descending into Squaw valley. The vein or lode is from four to six feet wide, running almost east and west with a northeasterly dip. The ore is the best I have seen, and some time back you made mention of its probable value. I want to know where the market for it is. We have it here at home without sending to the Cumberland mine, where I see it is shipped to Loudon and sold at from thirty-five to forty shillings per pound. We can afford it for less money here if the process of separating is not attended with too much expense. I can get out a ton a day of the ore I send you. Please tell me who will buy it in mass, and what is the process of dressing and preparing it.

W. W. T.

We examined the ore sent, and considered it of rather inferior quality, which opinion has been verified by State Mineralogist Hanks, to whom the sample was submitted. Judging by its appearance only, he thinks it would not pay to do anything with. He says numbers of samples of this substance have been sent from different parts of this State to the Mining Bureau, but, without exception, they have been of poor character, and none of them showed any signs of excellence. There are specimens on exhibition there from Guerneville, Sonoma county; from Tuolumne county, Pine Flat, Sonoma county, and Wood River, Idaho, and some very fine samples from New York, Liberia and Mexico. But none of our Pacific coast graphite is worth much. Small quantities have been found which could be utilized, but no large deposits of excellence.

Plumbago (or more properly, graphite) is found all over the United States, being quite widely distributed; but as an ore to be mined, there are very few places where it is sufficiently pure or in quantities to be worked. There are several places in Colorado, Wyoming, New Mexico and Dakota, where deposits are found; and it also occurs in Pennsylvania, New Jersey, New York, Canada, Alahama, North Carolina and Virginia. Some of its deposits are of such a nature that purification of the material is impossible at figures that would make it economical. Samples of graphite have been received and reported on by the Dixon Crucible Company as follows: Big Horn, Wyoming; Pattersville, N. Y.; Los Angeles, Cal.; Portland, Penn.; Chester Springs, Penn.; Richmond, Va.; St. Johns, Newfoundland; Marlboro, N. H.; Vallecito, Cal.; German Valley, N. J.; Baltimore, Md.; York Mills, Penn.; Lancaster, Penn.; Lowell, Mass.; Eagle Bridge, N. Y.; Sidney, Nova Scotia; Mountain Creek, Ala.; Marietta, Ga.; Fort Bowie, Arizona; Waynesboro, Va.; Atlanta, Ga.; Ouray, Colo.; Salt Lake, Utah; Bloomingdale, N. J.; Mansfield, Conn.; Litchfield, Mich.; Crook City, Dak.; Silver City, Colo.; Yarmouth, Maine.

The only place in the U. S. where graphite is now mined successfully is at Ticonderoga, N. Y. This property, owned originally by the American Graphite Co., now belongs to the Jos. Dixon Crucible Co., of Jersey City, N. Y. The American Graphite Co. worked the vein deposits to a depth of 600 feet. The Dixon Co. now mine a graphitic schist fifteen feet thick, carrying from eight to fifteen per cent of graphite, practically an inexhaustible supply. Numerous attempts have been made to work similar deposits of Pennsylvania and New Jersey, but with only partial success. The parties interested in these attempts are: The Pennsylvania Plumbago Co., Eagle Plumbago Co. and Phœnix Plumbago Co., all of which have worked deposits in Pickering valley, Pennsylvania. The American Chemical Manufacturing Co., of Rochester, N. Y., which has worked the deposits in Northern New Jersey; Mr. A. Z. Ryerson, who in 1882 worked the deposit at Bloomingdale, N. J. Mines of merit are also known in Georgia.

Ore Dressing.

Several methods (both wet and dry) of dressing the ore have been attempted. In Vol. IX, page 732, Transactions American Institute of Mining Engineers, Prof. Frazer, of Philadelphia, gives a description of the process adopted in Pickering Valley. The process used by the Dixon Company, at Ticonderoga, owes its success to careful supervision. It is a wet process in which the ordinary practice is reversed, the "tailings" being the useful product. All attempts at dry concentration have failed.

Production.

The production of the Ticonderoga mine in 1882 was 400,000 pounds. Mr. John A. Walker, in a chapter on the subject of the "Mineral Resources of the U. S.," gives the probable output for all other mines in this country at 25,000 pounds, making a total output in 1882 of 425,000 pounds. In 1883 the Dixon Company arranged for an output of 500,000 pounds. The whole product this year was about 525,000 pounds. The average spot value of plumbago may be stated at eight cents per pound. Plumbago smelters are made in this city.

Kinds.

On account of the peculiar advertising it has had graphite is commercially known as German black lead, Ceylon plumbago and American graphite. German black lead is a product of Bavaria. It is of the amorphous variety, and is dressed chiefly by washing. Its price depends on its percentage of graphite and the nature of its impurities, varying from $1 to $10 per hundred weight in cargo lots. It is used to make pencils, stove polish and foundry facings. Ceylon plumbago is mined at Travancore, Ceylon, and is shipped from Columbo to all parts of the world. It occurs in immense veins of great purity. Cobbing and sizing are the only preliminary operations it undergoes. It appears in the market graded according to size, as large lumps, small lumps, chips and dust. Its price varies from $2 for dust, to $10 per hundred-weight for prime lumps in cargo lots. It is used for all the purposes of trade except the manufacture of pencil leads.

Fineness exercises considerable influence on the price of graphite, on account of the difficulty of pulverizing. American graphite is used for all purposes of the trade, and excels all kinds as a lubricant. It is the same geologically, etc., as the Canadian. Before the development of the American and Canadian mines the Ceylon mineral was the standard.

Analyses.

In 1876 the Canadian government authorized an extended survey and investigation of the comparative merit of the Ceylon and Canadian varieties. The following table of analyses of carefully prepared samples is from the report of the survey:

ANALYSES OF CANADIAN AND CEYLON GRAPHITES.

LOCALITY.	Specific gravity.	Volatile matter.	Carbon.	Ash.
		Pr. Ct.	Pr. Ct	Pr. Ct.
Canada, Buckingham; vein; variety, foliated	2.2689	0.178	99.675	0.147
Canada, Buckingham; variety, columnar...	2.2679	0.594	97.626	1.780
Canada, Grenville; variety, foliated.....	2.2714	0.109	99.815	0.070
Canada, Grenville; variety, columnar.....	2.2659	0.108	99.757	0.135
Ceylon, vein graphite; variety, columnar...	2.2671	0.158	99.792	0.050
Ceylon, vein graphite; variety, foliated.....	2.2664	0.108	99.679	0.213
Ceylon, vein graphite; variety, columnar...	2.2546	0.900	98.817	0.283
Ceylon, vein graphite; variety, foliated.....	2.2484	0.301	99.284	0.415

These analyses prove the oft-repeated claim of the dealers in Canadian and American graphite that it is equal to the best Ceylon.

Manufactures.

The properties of graphite make it useful for the following general purposes: The manufacture of refractory articles, lubricants, electrical supplies, pigments, and pencil leads. A detailed table of the articles made from it is annexed, with an estimate of the percentage used for each purpose:

PROPORTIONATE AMOUNTS OF GRAPHITE USED FOR DIFFERENT PURPOSES.

Manufactures.	Kinds of Graphite used.	Per Ct.
Crucible and refractory articles, as stoppers and nozzles, crucibles, etc.....	Ceylon, Am.....	35
Stove polish.....	Ceylon, Am., Ger.	32
Lubricating graphite.....	Am., Ceylon.....	10
Foundry facings, etc.....	Ceylon, Am., Ger.	8
Graphite greases.....	American	6
Pencil leads	Am. and Ger	3

Paint.....	American	½
Electrotyping.....	Am., Ceylon.....	½
Miscellaneous—piano action, photographers', gilders', and hatters' use, electrical supplies, etc	.....	1
		100

The earliest use of graphite was for pencil leads. La Moine cites a document of 1387 ruled with graphite. Its use for this purpose has become so extended that in 1882 over 15,000,000 pencils were made in the world. Previous to 1827 black lead crucibles were made only in Germany. In that year the late Joseph Dixon began their manufacture in this country, using graphite from New Hampshire. He afterward saw samples of Ceylon plumbago, and appreciating its value he secured a shipment from Ceylon in 1829. This was the first importation of Ceylon plumbago into this country. Since that time its use has steadily increased. In the fiscal year 1882, 16,047,100 pounds of plumbago were imported, most of which was from Ceylon; the rest from Germany.

Graphite has long been used as a lubricant. This is one of the most useful applications, and one which promises most for the future. Formerly it was offered to the engineer only in the form of a dry powder; now it is compounded or mixed with fats and oils in many ways, some of which are patented. This use of graphite is attracting the attention of all interested in the problem of the reduction of friction, and promises to outstrip all others. The barriers which have prevented its extensive use in this direction have been the price and the difficulty of securing purity and freedom from all grit. These are now both overcome, the price being now less than 25 per cent of what it was 15 years ago. The purity, which is now absolute, was then only approximate. For all heavy work graphite is undoubtedly the lubricant of the future.

The growth of the graphite industry has kept pace with the age, each new development in metallurgy and engineering offering some new field of usefulness for graphite. For instance, it furnishes the pots for the manufacture of cast steel, and the nozzles and stoppers used in the Bessemer process. It it used in the manufacture of electrical supplies, etc. Fifty years ago graphite was little known and misnamed; now it is of constantly increasing importance. From an insignificant beginning in the present century, the industry has grown to its present proportions.

The principle houses engaged in the graphite industry are as follows:

Joseph Dixon Crucible Company, J. H. Gautier & Co., Jersey City, N. J.; Phœnix Crucible Company, Taunton Crucible Company, Willard & Lane, Taunton, Mass.; R. Taylor & Co., Scidell & Co., Ross & Co., H. A. Bartlett & Co., Phœnix Mining Company, Philadelphia, Penn.; A. W. Faber, Eagle Pencil Company, American Lead Pencil Company, Cutter & Brown, New York City; Variety Iron Works, Cleveland, Ohio; S. Obermayer & Co., Cincinnati, Ohio; Morse Bros., Canton, Mass.; J. L. Prescott & Co., North Berwick, Me.; American Chemical Manufacturing and Mining Company, Rochester, N. Y.; Ransom & Co., Albany, N. Y.; W. H. Colebrook, Syracuse, N. Y.; G. A. Moss, Lustro Company, New York City; I. X. L. Stove Polish Company, Grand Rapids; A. Z. Ryerson, Bloomingdale, N. J.

The New Copper Assay.

[Written for the PRESS by C. H. AARON.]

The presence of a little ammonium chloride seems to favor the clearing of the liquid, yet this clearing was less perfect in some trials than in others, the cause of which remains to be ascertained. I think too great an excess of ammonia is injurious. A great quantity of ammonium chloride makes the liquid too dense, causing the precipitate to float. The stirring should be quite active, but not so violent as to cause frothing. The effect of a change of 20 or 30 degrees of temperature may cause a difference of one-half or more per cent in the result, as it causes the float to rise in the burette to the extent of half a c. c.

I do not find it necessary to use a veruier graduated float, as my burette, though only graduated to half c. c., drops 20 to the c. c. without perceptible variation from top to bottom.

I have operated, so far, on 100 milligrammes of pure copper for standardizing, and 200 of ore for the assay. Euargite, from Alpine Co., gives me 46.33 per cent copper. Dana gives 45.95 per cent. (Root's analysis); Mr. A. K. Brewer, of Tucson, assayer, finds 46.3 per cent by electrolysis.

By standardizing on a larger quantity of copper, using also stronger solutions, and a correspondingly larger quantity of ore, there will be, I think, no difficulty in getting results accurate to one-tenth of one per cent, or even closer.

The assay may be made on a neutral, an alkaline, or a slightly acid solution (it may be strongly acid with acetic acid), but in acid or neutral solutions, zinc, cobalt and nickel would interfere if present. Arsenic is harmless. I have not found it necessary to use a standard solution of copper for backworking, but great care is needed to avoid overshooting the mark with the zanthate.

The assay might be made in precisely the same manner as the humid assay of silver, with a normal and a decime solution of the zanthate in place of salt. In this case an approximative assay might be made by the cyanide process, and such a quantity of the ore taken as should contain a little less than a certain quantity of copper.

The method seems to be exceptionally adapted to the assay of alloys of copper, such as brass. It remains to be seen how long the zanthate will retain its virtue, but it will certainly do so for some weeks, and is not troublesome to prepare, though smelling disagreeably. I hope soon to have another new assay perfected.

Metallurgy and Ores.

Nevada Metallurgical Works.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

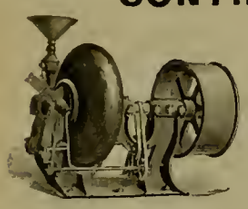
HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin or Olant and Old Abe Co., Black also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.



LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. Rivets Hand Driven.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise), at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

"Square the Year."

There are not many customs we care to borrow from the Chinese, but there is one excellent one they have of settling up all their accounts at the end of each year, that it would be handy to have grafted on to our Western civilization. For instance, it would be of great assistance to the publishers of this journal to have all its patrons renew their subscriptions promptly, save the expense of collections, avoid the changing and shifting of the position of the names on the printed mail list, and prevent some of the chances of errors occurring in addressing and mailing our very large list of subscribers. We, therefore, kindly urge upon all those who possibly can to renew their subscriptions early.

This is an excellent period for all not paid in advance to remit and place their credit ahead for 1884. Verily every enterprising publisher holds at a premium his list of promptly paying patrons. We hope our friends will not delay forwarding their postal orders because a single subscription is small in amount. We need the support of every intelligent person interested in the objects to which our paper is devoted. It is the interest of all such that the PRESS should be well sustained.

We have endeavored in every way to make these issues so valuable to its readers as to make it almost indispensable. No man can read it who will no likely find at least in one or more copies during the year, something worth many times the subscription price.

Mining Share Market.

The holidays and partial cessation of business of the stock boards has made the share market duller than usual this week. Nothing special has transpired in the mines either to help the market along. On the Comstock, at the north end, work is progressing favorably at all points. After following some ore streaks to the eastward a distance of 24 feet, by means of a crosscut from the east station of the 3100 level of the Sierra Nevada, they have now started the regular north drift. At the middle mines operations have been a good deal delayed during the week by the breaking of the rod of the Cornish pump at the Chollar-Norcross-Savage shaft. The break has been repaired, however, and all is now progressing favorably. At the Imperial they have now but 100 feet to go to reach the old upper levels. They have been doing excellent work in this drift, as the rock was very hard and all has been done by hand drilling. A good feature is that the drift needs no timbering, and will stand for all time without giving any trouble or calling for repairs. At Gold Hill many miners have been laid off on account of the low stage of water in the Carson river, but this is merely a temporary difficulty.

IF YOU want a lubricant that will run any thing cool write CHARLES J. WOODBURY, GENERAL MANAGER LUBRICATING DEPARTMENT CONTINENTAL OIL AND TRANS. Co., for "Lubrice." It is the best compound grease in the market. Shipped in 5, 10 and 25-pound cans, half barrels and barrels. Warranted to give satisfaction. Observe the numbers: No. 2 is soft for outside work; No 3 is medium soft; No. 4 is medium hard; No. 5 is very hard, where unusual lubrication is demanded. Send for Catalogue of Lubricating Oils

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Know

That BROWN'S IRON BITTERS will cure the worst case of dyspepsia.

Will insure a hearty appetite and increased digestion.

Cures general debility, and gives a new lease of life.

Dispels nervous depression and low spirits.

Restores an exhausted nursing mother to full strength and gives abundant sustenance for her child.

Strengthens the muscles and nerves, enriches the blood.

Overcomes weakness, wakefulness, and lack of energy

Keeps off all chills, fevers, and other malarial poison.

Will infuse with new life the weakest invalid.

37 Walker St., Baltimore, Dec. 1881.
For six years I have been a great sufferer from Blood Disease, Dyspepsia, and Constipation, and became so debilitated that I could not retain anything on my stomach, in fact, life had almost become a burden. Finally, when hope had almost left me, my husband seeing BROWN'S IRON BITTERS advertised in the paper, indneed me to give it a trial. I am now taking the third bottle and have not felt so well in six years as I do at the present time.
Mrs. L. F. GRIFFIN.

BROWN'S IRON BITTERS will have a better tonic effect upon any one who needs "bracing up," than any medicine made.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

Awarded SILVER MEDALS in 1882 and 1883 By Mechanics' Institute.

MANUFACTURED AT

The Tustin Windmill Horse-power and Pumping Machine Works.

308 Mission Street, S. F., Cal.

By W. I. TUSTIN, Inventor and Patentee.

SAN FRANCISCO TOOL COMPANY, - - - - 11 STEVENSON ST., L. F.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 500 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,
Room 7, 109 California Street, - - - SAN FRANCISCO, CAL
Nov. 6, 1882.

EDUCATE THE GIRLS.

THE HARMON SEMINARY,

Berkeley, Alameda County, Cal.

A FIRST CLASS BOARDING SCHOOL FOR YOUNG LADIES.

Mrs. F. W. HARMON, Principal.

THE CHARACTER OF THE INSTITUTION:

It is the aim of this institution to furnish the best attainable education for young women. The imparting of useful information and mental culture is attended by the most intelligent effort to develop true womanly qualities, and to instill principles of good taste and sound judgment. Thus, the institution possesses a family character in its best sense.

The charges for tuition and board are made as low as possible without sacrificing excellence, so as to place the School within the reach of those whose means are moderate. It is a principle of this School that those who are wealthy as well as those whose means are limited, should, as a part of their education, be taught to practice economy, and by their example discourage extravagance in dress and personal expenditure, either for ornament or luxury.

It is not an ambition of this School to bring together a large and imposing array of pupils. Its numbers are limited; hence each pupil receives that close personal attention and instruction rendered impossible where multitudes are gathered together.

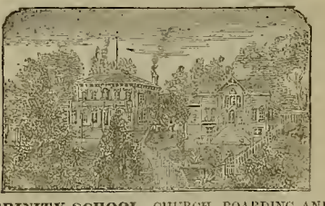
THE NEXT TERM WILL OPEN JANUARY 3, 1884.

For Catalogues or other Information, addres Mrs. F. W. HARMON, Berkeley, Cal., or E. J. WICKSON, 414 Clay Street, San Francisco.

NOTICE OF ASSESSMENT.

The Land Purchasers' Association.—Location of principal place of business, San Francisco, Cal.

NOTICE IS HEREBY GIVEN, that at a meeting of the Board of Directors, or Trustees, held on the 5th day December, 1883, an assessment of five dollars ($5.00) per share (being balance of 44th and part of 45th installments) was levied upon the capital stock of this corporation, payable immediately to the Secretary at the office of the Company, 318 Montgomery St., San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 7th day of January, 1884, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 12th day of February, 1884, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.



EDWARD P. CRAY, Secretary.

HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.
It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.
While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. ☞SEND FOR CIRCULAR. Address
PACIFIC IRON WORKS,
Rankin, Brayton & Co.,
SAN FRANCISCO - AND - CHICAGO

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all frame-work. When required, these whims are made in sections to pack on mules.
120 in Actual Use.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion slew several giants who opposed him, and with one blow of his club a high mountain from summit to base.

No. 1 (XX) is the strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

PAT. OCT. 25, 1881.

Reliance Machine Works,

CLOT & MEESE,

Sole Licensed Manufacturers of the

Medart Patent Wrought Rim Pulley

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

SEND FOR CIRCULAR AND PRICE LIST.

Nos. 129 and 131 Fremont Street, - - - SAN FRANCISCO, CAL.

INDEX TO VOL. XLVII.

....OF THE....

MINING AND SCIENTIFIC PRESS.

From July to December, 1883.
